fixed at a point $A$ on the plane through $C$, corresponding to the other generating line $HQ'$ through $H$, so that the same line of curvatures rolls on two planes at a constant distance from $O, \delta, \delta'$; and the motion of the top is made up of the motion of $C$; this completes the statement of Jacobi's theorem (Werke, ii. 480) that the motion of a top can be resolved into two movements of a body under no force.

Starting with Poinset's polehode and polehode given in (44), the normal plane is drawn through $H$, cutting the principal axes of the rolling quadric in $X, Y, Z$; and then

$$x'^2 + y'^2 + z'^2 = x^2 + y^2 + z^2$$

$\alpha^2 + \mu = x, \beta^2 + \mu = y, \gamma^2 + \mu = z, OZ$.

The curvature is useful in drawing a curve of $H$; the diameter of curvature $D$ is given by

$$D = \mu x + \beta y + \gamma z$$

$$D = \mu x + \beta y + \gamma z$$

$$D = \mu x + \beta y + \gamma z$$

$$D = \mu x + \beta y + \gamma z$$
GYROSCOPE AND GYROSTAT

The curvature is zero and H passes through a point of inflection when C' comes into the horizontal plane through C. \( \psi \) will then be stationary and the curve described by C' will be looped. In a state of steady motion, \( z \) oscillates between two limits \( z_1 \) and \( z_2 \) which are close together; so putting \( z_0 = \psi \) the coefficient of \( z \) is \( \frac{Zs}{A} \), \( \psi \) being the difference of the position angles of the axis and the normal to the plane of the ellipse.

The wheel making \( R/2 \) revolutions per second,

\[
\text{beats/second} = \frac{\text{revolutions/second}}{\sqrt{(\text{OM}.\text{ON})}} \quad \frac{\text{MN}}{n} \quad \frac{\text{MC}}{\text{MN}}
\]

Equation (8) \& 9 must be changed to

\[
m = n \sqrt{\frac{r_2 - r_1}{2}} = \sqrt{\frac{1}{4} \frac{r_2 - r_1}{2}}
\]

(25)

(26)

While \( \psi \) and \( \omega \) change places in (26).

The Jacobian elliptic parameter of the third elliptic integral in (10) can be given by \( \nu \), where

\[
\nu = \int \sqrt{Z_2} \left( Z_2 - \frac{1}{2} \right) \frac{dZ_2}{E} \quad \frac{E}{\sqrt{(4Z_2)}}
\]

where \( f \) is a real fraction,

\[
1 - f = K' = 2 \sqrt{\frac{E}{s_2}} \frac{dZ_2}{E}
\]

Then, with \( s = E \), and

\[
K = 2 \sqrt{\frac{E}{s_2}} \frac{dZ_2}{E}
\]

\[
K = 2 \sqrt{\frac{E}{s_2}} \frac{dZ_2}{E}
\]

if \( K \) denotes the apsidal angle of \( s \), and \( T \) the time of a single beat of the axle, up or down,
and then the vector components OC', C'K, KH, HI give a resultant vector OI, representing the angular velocity \( \omega \), such that

\[
O_1Q' = \omega R.
\]

The point I is then fixed on the generating line Q'H of the deformable hyperboloid, and the other generator through I will cut the fixed generator OC of the opposite system in a fixed point O'.

Then if \( t' = K + (1 - f)K' \) is the parameter corresponding to \( z = D \), we find

\[
f = f_1 - f_3, \quad f' = f_1 + f_3,
\]

The most symmetrical treatment of the motion of any point fixed in the top will be found in Klein and Sommerfeld, *Theorie des Kreisel*, to which the reader is referred for details; four new functions, \( a, \beta, \gamma, \delta \), are introduced, defined in terms of Euler's angles, \( \alpha, \beta, \gamma \), by

\[
\begin{align*}
\alpha &= \cos \theta \exp (\phi + \psi), \\
\beta &= i \sin \theta \exp (- \phi + \psi), \\
\gamma &= -i \sin \theta \exp (- \phi - \psi), \\
\delta &= \cos \theta \exp (\phi - \psi),
\end{align*}
\]

Next Klein takes two functions or co-ordinates \( \lambda \) and \( \Lambda \), defined by

\[
\lambda = x + iy, \quad \Lambda = x - iy,
\]

and \( \lambda \) the same function of \( X, Y, Z \), so that \( \lambda \) play the part of stereographic representations of the same point \( (x, y, z) \) or \( (X, Y, Z) \) on a sphere of radius \( r \), with respect to poles in which the sphere is intersected by OZ and Oz.

These new functions are shown to be connected by the bilinear relation

\[
\lambda = a \lambda + b, \quad a \theta - b = 1,
\]

in accordance with the annexed scheme of transformation of co-ordinates:

\[
\begin{array}{ccc}
\xi & \eta & \zeta \\
\phi & \beta & \gamma \\
2a & 2b & 2ab
\end{array}
\]

where

\[
\begin{align*}
\xi &= x + y, \\
\eta &= x - y, \\
\zeta &= z - z_i, \\
\phi &= X + Yi, \\
\beta &= Y + Xi, \\
\gamma &= Z - Z_i
\end{align*}
\]

and while, for the motion of a point on the axis, putting \( \lambda = 0 \), or \( \infty \),

\[
\begin{align*}
\lambda &= \beta = \tan \theta \sec \phi, \\
\Lambda &= \gamma = -i \cot \phi \sec \psi,
\end{align*}
\]

giving orthogonal projections on the planes GHK, CHK; and

\[
\frac{d \eta}{dt} = \frac{d \phi}{dt} = \frac{d \beta}{dt} = \frac{d \gamma}{dt},
\]

the vectorial equation in the plane GHK of the horephode of \( H \) for a spherical top.

When \( f_1 \) and \( f_2 \) in \( (9) \) are rational fractions, these multiplicative elliptic functions can be replaced by algebraic functions, qualified by factors which are exponential functions of the time \( t \); a series of quasi-algebraical cases of motion can thus be constructed, which become purely algebraical when the exponential factors are cancelled by a suitable arrangement of the constants.

Thus, for example, with \( f_0 = f_1 = 1, f_2 = \frac{1}{4} \), as in (24) \( g \), where \( P \) and \( P' \) are at \( A \) and \( B \) on the focal ellipse, we have for the spherical top

\[
(1 + \cos \theta) \exp (\phi + \psi - g') = \sqrt{\sec \beta - \cos \theta} + i \sqrt{\cos \beta + \cos \beta - \cos \theta},
\]

\[
(1 - \cos \theta) \exp (\phi - \psi - g') = \sqrt{\sec \beta - \cos \theta} \sqrt{\cos \beta - \cos \beta - \cos \theta} + i \sqrt{\cos \beta - \cos \beta - \cos \theta},
\]

(25) \( g, g' = \nu (2 \sec \beta) - \nu (2 \cos \beta) \), and hence \( a, \beta, \gamma, \delta \) can be inferred.

The physical constants of a given symmetrical top have been denoted in § 1 by \( M, h, A, C \), and \( a, b, T \); to specify a given state of general motion we have \( G \), \( G' \) or \( CR, C', D, E, F \), which may be called the dynamical constants; or \( a, b, v, w, m, n, s, f_1, f_2, f_3, f_4 \), the analytical constants; or the geometrical constants, such as \( a, b, \alpha, \delta \), of a given articulated hyperboloid.

There is thus a triply infinite series of a state of motion; the choice of a typical state can be made geometrically on the hyperboloid, flattened in the plane of the local ellipse, of which \( x \) is the ratio of the semiaxes \( a \) and \( b \), and \( am(1 - f)K' \) is the eccentric angle from the minor axis of the point of contact \( P \) of the generator \( HQ \), so that two analytical constants are settled thereby; and the point \( H \) may be taken arbitrarily on the tangent line \( PQ \), and \( HQ' \) is then the other tangent of the focal ellipse; in which case \( \theta_2 \) and \( \theta_3 \) are the angles between the tangents \( HQ, HQ' \), and between the focal distances \( HS, HS', K' \) will be \( HS, HS' \), while \( HQ, HQ' \) are \( \phi, \phi' \).

FIG. 12.
As H is moved along the tangent line HQ, a series of states of motion can be determined, and drawn with accuracy.

Equation (5) § 3 with slight modification will serve with the same notation for the steady rolling motion at a constant inclination a to the vertical of a body of revolution, such as a disk, hoop, wheel, cask, wine-glass, plate, dish, bowl, spinning top, gyrostat, or bicycle, on a horizontal plane, or a surface of revolution, as a coin in a conical symphony.

The point O is now the intersection of the axis GC' with the vertical through the centre B of the horizontal circle described by the centre of gravity, and through the centre M of the horizontal circle described by P, the point of contact (fig. 13). Collected into a particle at G, the body swings round the vertical GB as a conical pendulum, of height AB or GL equal to \( gM/\mu \), and GA would be the direction of the thread of tension \( GM(\alpha/G\alpha) \) dynes. The reaction with the plane at P will be an equal parallel force; and its moment round C will provide the couple which causes the velocity of the vector of angular momentum appropriate to the steady motion; and this moment will be

\[ gMGM \text{ dyn.-em. or ergs, if the reaction at P cuts GB in } m. \]

Draw GR perpendicular to GK to meet the horizontal AL in m, and draw QKC perpendicular to the axis Gz, and KC perpendicular to LG.

The velocity of the vector GK of angular momentum is a times the horizontal component, and

\[ \text{(2) } gMGM = \alpha \sin ab = \alpha(KC/KC'), \]

so that

\[ gMGM = \alpha \sin ab = \alpha(KC/KC'), \]

\[ \text{(3) } gMGM \sin ab = \alpha(KC/KC'), \]

The instantaneous axis of rotation of the case of a gyrostat would be OP; drawing G1 parallel to OP, and KK' parallel to OG, making tan K'G'C' = (A/\alpha) tan 1G'C'; then if GK represents the resultant angular momentum, KK' will represent the part of it due to the rotation of the fly-wheel. Thus in the figure for the body rolling as a solid, with the fly-wheel clamped, the points m and Q move to the other side of G. The gyrostat may be supposed swung round the vertical at the end of a thread PA' fastened at A' where P'sm produced cuts the vertical AB, and again at the point where it crosses the axis GO. The discussion of the small oscillation superposed on the state of steady motion requisite for stability is given in the next paragraph.

General motion of a gyrostat rolling on a plane.

Drawing through G the centre of gravity any three rectangular axes Gx, Gy, Gz, the notation employed is

\( u, v, w \), the components of linear velocity of \( G; \)

\( \beta, \gamma, \tau \), the components of angular velocity about the axes,

\( \beta, \gamma, \tau \), the components of angular momentum,

\( x, y, z \), the coordinates of the point of contact with the horizontal plane;

\( X, Y, Z \), the components of the reaction of the plane on \( G; \)

\( \alpha, \beta, \tau \), the direction cosines of the downward vertical.

The geometrical equations, expressing that the point of contact is at rest on the plane, are

\[ \text{(1) } u = -x, \quad v = -y, \quad w = -z = \rho \alpha, \]

\[ \text{(2) } u = -x, \quad v = -y, \quad w = -z = \rho \alpha, \]

\[ \text{(3) } u = -x, \quad v = -y, \quad w = -z = \rho \alpha. \]

The dynamical equations are

\[ \text{(4) } \frac{dx}{dt} + \beta x + \gamma y = gM + X/M, \]

\[ \text{(5) } \frac{dy}{dt} + \beta y + \gamma z = gM + Y/M, \]

and

\[ \text{(6) } \frac{dz}{dt} + \beta z - M \tau = gM + Z/M, \]

\[ \text{(7) } \frac{dx}{dt} + \beta x + \gamma y = gM + X/M, \]

\[ \text{and} \]

\[ \text{(8) } \frac{dx}{dt} + \beta x + \gamma y = gM + X/M, \]

\[ \text{and} \]

\[ \text{(9) } \frac{dx}{dt} + \beta x + \gamma y = gM + X/M. \]

In the special case of the gyrostat where the surface is of revolution round Gz, and the body is kinetically symmetrical about Gz, we take Gy horizontal and Gx = Gz through the point of contact so that \( x = 0 \), and denoting the angle between Gz and the downward vertical by \( \theta \) (fig. 13),

\[ \text{(10) } \alpha = \sin \theta, \quad \beta = 0, \quad \gamma = \cos \theta. \]

The components of angular momentum are

\[ \text{(11) } h_x = h_y = h_z = \alpha(Gz - K), \]

where A, C denote the moment of inertia about Gx, Gz, and K is the angular momentum of a fly-wheel fixed in the interior with its axis parallel to Gz; K is taken as constant during the motion.

The axis Gz being fixed in the body,

\[ \text{(12) } \delta_1 = \rho, \quad \delta_2 = gM, \quad \delta_3 = \rho \cos \theta, \quad \delta_4 = -\rho \sin \theta \]

and so that

\[ \text{(13) } \frac{d^2x}{dt^2} = -\delta_2 - \delta_4 \sin \theta, \]

\[ \text{(14) } \frac{d^2y}{dt^2} = -\delta_2 - \delta_4 \cos \theta, \]

\[ \text{(15) } \frac{d^2z}{dt^2} = -\delta_2 - \delta_4 \cos \theta. \]

The dynamical equations (4) . . . (9) can now be reduced to

\[ \text{(16) } X = \frac{d^2x}{dt^2} = -gM \sin \theta + gM \cos \theta, \]

\[ \text{(17) } Y = \frac{d^2y}{dt^2} = -gM \sin \theta + gM \cos \theta, \]

\[ \text{(18) } Z = \frac{d^2z}{dt^2} = -gM \sin \theta - gM \cos \theta, \]

\[ \text{(19) } \frac{dx}{dt} - \delta_2 - \delta_4 \cos \theta = 0, \]

\[ \text{(20) } \frac{dy}{dt} - \delta_2 - \delta_4 \cos \theta = 0, \]

\[ \text{(21) } \frac{dz}{dt} - \delta_2 - \delta_4 \cos \theta = 0. \]

Eliminating Y between (19) and (23),

\[ \text{(22) } \frac{xM}{X + x} = \frac{d^2x}{dt^2} - \delta_4 \cos \theta = 0, \]

\[ \text{(23) } \frac{xM}{X + x} = \frac{d^2x}{dt^2} - \delta_4 \cos \theta = 0. \]

In the special case of a gyrostat rolling on the sharp edge of a circle passing through G, \( z = 0, \rho = 0, \alpha \) and (A) reduce to

\[ \text{(24) } \frac{xM}{X + x} = \frac{d^2x}{dt^2} - \delta_4 \cos \theta = 0, \]

\[ \text{(25) } \frac{xM}{X + x} = \frac{d^2x}{dt^2} - \delta_4 \cos \theta = 0. \]

In the special case of a gyrostat rolling on the sharp edge of a circle passing through G, \( z = 0, \rho = 0, \alpha \) and (A) reduce to

\[ \text{(26) } \frac{xM}{X + x} = \frac{d^2x}{dt^2} - \delta_4 \cos \theta = 0, \]

\[ \text{(27) } \frac{xM}{X + x} = \frac{d^2x}{dt^2} - \delta_4 \cos \theta = 0. \]

With the gyrostat at the edge of the wheel, the equations (A) (B) (C) are intractable in this general form; but the restricted case may be considered when the axis moves in steady motion at a constant inclination \( \alpha \) to the vertical; and the stability is secured if a small fluctuation of the axis can be superposed. It is convenient to put \( \rho = \Omega \sin \theta \), so that \( \Omega \) is the angular velocity of the plane Gx about the vertical; (A) (B) (C) become
Thus for a top spinning upright on a rounded point, with \( K = 0 \), the stability requires that

\[ (23) \quad k \cdot k' \cos (\theta - \phi) \leq \frac{1}{2} (k + k') \sin \theta \]

where \( k, k' \) are the radii of gyration about the axis \( G \), and a perpendicular axis at a distance \( c \) from \( G \); this reduces to the preceding case of \( \theta = \phi = 0 \).

Generally, with \( a = 0 \), but \( a < 0 \), the condition (A) and (B) becomes

\[ (16) \quad \left( \frac{M + a^2 + \pi^2}{M + a^2} \right) \frac{d^2 a}{dt^2} = -2ac \omega_0 - \frac{a}{M + a^2}, \]

so that, eliminating \( Q/L \),

\[ (17) \quad \frac{2}{M + a^2} \left( \frac{M + a^2}{M + a^2} - a^2 \right) \frac{d}{dt} = \left( \frac{M + a^2}{M + a^2} + C \right) \frac{R_C}{M} \]

Thus with \( K = 0 \), and rolling with velocity \( V = R_a \), stability requires

\[ (22) \quad \frac{V^2}{2g} - \frac{a - \phi}{C} \left( \frac{M + a^2}{M + a^2} \right) > \frac{a}{M + a^2}, \]

or the body must have acquired velocity greater than attained by rolling down a plane through a vertical height \( \frac{a}{M} \) of the wheel.

For the stability of the monorail carriage of \( \theta \) (6), ignoring the rotary inertia of the wheels by putting \( C = 0 \), and replacing \( K \) by \( G \) the theory above would require

\[ (25) \quad \frac{G^2}{A} \left( \frac{V}{C} + \frac{G}{A} \right) > \frac{a}{M + a^2}. \]

For further theory and experiments consult Routh, "Advanced Dynamics," chap., and Thomson and Tait, "Natural Philosophy," \$ 345; also Boulet, "Traité des bicyclettes" (translated in "Mécanique rationnelle," ii. 297, and Carvalho, "Journal de l'École polytech."

1875; E. Perry, "Spinning Tops," for a diagram). Suppose each gyrostat to be equivalent dynamically to a fly-wheel of axial length \( 2a \), and that each connecting link is a light cord or steel wire of length \( 2l \), stretched to a tension \( T \).

Denote by \( x, y \) the components of the slight displacement from the central straight line of the centre of a fly-wheel; and let \( x, y, t \) denote the direction cosines of the axis of a fly-wheel, and \( x, y, t \) the direction cosines of a link, distinguishing the different bodies by a suffix. With the previous treatment and to the order of approximation required,

\[ (1) \quad \delta_1 = -\frac{d}{dt} \frac{d}{dt}, \delta_2 = \frac{d^2}{dt^2}, \]

\[ (2) \quad R_{a1} = \frac{M + a^2}{M + a^2}, \delta_3 = \delta_4 = \ldots, \]

\[ (3) \quad \frac{d}{dt} \delta_5 + \frac{d}{dt} \delta_6 + \delta_7 = 1, \ldots \]

in which \( \delta_5 \) and \( \delta_6 \) can be omitted.

For the \( k \)-th fly-wheel

\[ (4) \quad \delta_9 + K^2 \delta_7 - T \delta_1 + 2a \delta_5 + \ldots, \]

and for the motion of translation

\[ (5) \quad M_5 \delta_2 = \frac{T_5}{T_5}, M_5 \delta_3 \]

while the geometrical relations are

\[ (6) \quad x_{a1} + x_{a2} = (x_{a1} + x_{a2}) + 2l, \]

Putting

\[ (9) \quad x + y = \omega, \quad \delta = \omega \]

The steady motion and rotation superposed may be expressed as

\[ (10) \quad \delta = a - L, \sin \theta = \sin \phi \cos \theta \cdot \sin \theta \cos \theta = 0, \]

where \( L, N, Q \) are small terms, involving a factor \( e^{2/t} \), to express the periodic nature of the motion; and then if \( a, \phi \) denote the mean value of \( a, \phi \) at the point of contact,

\[ (11) \quad x = aL \cos \beta, \quad \sin \phi = \cos \phi \sin \theta \cos \phi = 0, \]

(9) \[ x = \cos \theta \sin \theta = \cos \phi \sin \phi \sin \theta \cos \theta = 0, \]

\[ (12) \quad \frac{d}{dt} \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} + 2a \left( \frac{M + a^2}{M + a^2} \right) - \frac{a}{M + a^2} \]

and denote \( a, x, G, \) equivalent and minima.

\[ (13) \quad \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} + 2a \left( \frac{M + a^2}{M + a^2} \right) > \frac{a}{M + a^2}, \]

or equal to \( G \), to \( G \), and \( G \) the gyrostats.

\[ (14) \quad \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} - \frac{a}{M + a^2} \]

Interpreted dynamically, the left-hand side of this equation represents the velocity of the vector of angular momentum about \( G \), so that the right-hand side represents the moment of the applied force about \( G \), in this case the reaction of the plane, which is parallel to \( G \), and equal to \( G \cdot G \cdot G \); and so the angle \( AGL \) may be less than the angle of friction, or slipping will take place.

Spinning upright, with \( a = 0 \), we find \( F = 0 \), \( Q = 0 \), and

\[ (12) \quad \frac{d}{dt} \left( \frac{M + a^2}{M + a^2} \right) - \frac{a}{M + a^2} = 0, \]

\[ (13) \quad \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} = - \frac{a}{M + a^2}, \]

\[ (14) \quad \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} - \frac{a}{M + a^2} = 0, \]

\[ (15) \quad \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} = \frac{a}{M + a^2}, \]

\[ (16) \quad \left( \frac{M + a^2}{M + a^2} \right) \frac{d}{dt} = \frac{a}{M + a^2}, \]
these three pairs of equations may be replaced by the three equations

\[ (10) \quad A_{\nu} - K_{\nu} + 2 \tau_{\nu} - T_{\nu} (s_{\nu} + t_{\nu}) = 0, \]
\[ (11) \quad M_{\nu} \tau_{\nu} - T_{\nu} (s_{\nu} - t_{\nu}) = 0, \]
\[ (12) \quad \tau_{\nu} (s_{\nu} + t_{\nu}) - 2 \nu \nu = 0. \]

For a vibration of circular polarization assume a solution

\[ \psi_{\nu}, \phi_{\nu} = (L, P, Q, \varphi) \exp(t \hat{n} + \phi_{\nu}) \]

so that \( c/n \) is the timelag between the vibration of one fly-wheel and the next; and the wave velocity is

\[ u = 2 c (a + b) . \]

Then

\[ P (t \hat{n} + K \hat{n} + 2 \tau _{a} - T_{a} (s_{a} + t_{a})) = 0, \]
\[ (13) \quad L (c \hat{n} + K \hat{n} - 2 \tau _{a} - T_{a} (s_{a} - t_{a})) = 0 \]

leading, on elimination of \( L, P, Q \), to

\[ \begin{aligned} \cos c & = 2 \tau _{a} + K \hat{n} - A_{\nu} \quad (1 - M_{\nu} (T_{\nu} - M_{\nu})), \\
2 \sin \hat{n} & = T_{\nu} \tau _{a} + K \hat{n} - A_{\nu} \quad (1 - M_{\nu} (T_{\nu} - M_{\nu})), \end{aligned} \]

With \( K = 0, A = 0 \), this reduces to Lagrange's condition in the vibration of a string of beads.

Putting

\[ \rho = M / (a + b), \]
\[ (15) \quad a = K / (a + b), \]
\[ a = A / (a + b), \]
\[ (16) \quad c = (a + b)/U, \]

equation (19) can be written

\[ \begin{aligned} \sin (a + b)/U & = - (a + b)/U, \\
\sin (a + b)/U & = - (a + b)/U \end{aligned} \]

in a continuous chain of such gyrostatic links, with \( a \) and \( b \) finite.

Changing the sign of \( n \) for circular polarization in the opposite direction

\[ \begin{aligned} U_{\nu} & = T \rho \left( \frac{K \hat{n} - A}{a (s_{a} - t_{a})} \right), \\
U_{\nu} & = T \rho \left( \frac{K \hat{n} - A}{a (s_{a} - t_{a})} \right), \end{aligned} \]

In this way a mechanical model is obtained of the action of a magnetized medium on polarized light, \( \varphi \) representing the equivalent of the magnetic field, while \( a \) may be ignored as insensible (J. Larmor, Proc. Lond. Math. Soc., 1890; Aether and Matter, Appendix E).

When \( U \) in (26) can be positive, and the gyrostat chain stable, even when \( T \) is negative, and the chain is supporting a thrust, provided \( s_{a} \) is large enough, and the thrust does not exceed

\[ (a + b)/U \]

while \( U_{\nu} \) will not be positive and the straight chain will be unstable unless the tension exceeds

\[ (a + b)/U \]

15. Gyrostat suspended by a Thread. In the discussion of the small vibration of a single gyrostat fly-wheel about the vertical position when suspended by a single thread of length \( 2l \times b \), the suffix \( k \) can be omitted in the preceding equations of \( \S 14 \), and we can write

\[ \begin{aligned} A_{\nu} - K_{\nu} + 2 \tau_{\nu} - T_{\nu} (s_{\nu} + t_{\nu}) = 0, \\
M_{\nu} \tau_{\nu} - T_{\nu} (s_{\nu} - t_{\nu}) = 0, \\
\varphi \exp(t \hat{n} + \phi_{\nu}) \quad \text{with } T = gM, \\
\varphi \exp(t \hat{n} + \phi_{\nu}) \quad \text{with } T = gM, \\
A_{\nu} - K_{\nu} + 2 \tau_{\nu} - T_{\nu} (s_{\nu} + t_{\nu}) = 0, \end{aligned} \]

so that the stability requires

\[ K^{2} \geq 4gA_{\nu}. \]

Here A denotes the moment of inertia about a diametral axis through the centre of gravity; when the point of the fly-wheel is held in a small smooth cup, \( b \) is zero, and the condition becomes

\[ (A + M_{\nu}^{2})^{2} - K_{\nu} + 2 \tau_{\nu} - T_{\nu} (s_{\nu} + t_{\nu}) = 0, \]

requiring for stability, as before in \( \S 3 \).

\[ K^{2} > 4gA_{\nu}. \]

For upright spinning inside a spherical surface of radius \( b \), the sign of \( a \) must be changed to obtain the condition at the lowest point, as in the gyroscopic horizon of Foucault.

For a gyrostat of weight \( g \) mounted upright on the summit of a sphere of radius \( b \), the signs of \( a \) and \( b \) must be changed in (5), or else the sign of \( g \), which amounts to the same thing.

Denoting the components of horizontal displacement of the point of the fly-wheel by \( x, y, z \), then

\[ \begin{aligned} bx & = x (a + b), \\
yb & = y (a + b), \end{aligned} \]

\[ \text{so that} \]

\[ x = \frac{a + b}{b} x, \]

\[ y = \frac{a + b}{b} y, \]

\[ z = \frac{a + b}{b} z. \]

18. The gyrostatic equations of motion of the gyrostat. The solution is

\[ (17) \quad -b \exp(t \hat{n} + \phi_{\nu}) \]

\[ \begin{aligned} \sin (a + b)/U & = - (a + b)/U, \\
\sin (a + b)/U & = - (a + b)/U \end{aligned} \]

so that, in the small vibration,

\[ \begin{aligned} \rho & = - \frac{K \hat{n} - A}{a (s_{a} - t_{a})}, \\
\rho & = - \frac{K \hat{n} - A}{a (s_{a} - t_{a})} \end{aligned} \]

in the gyroscopic chain of §14, the tension \( T \) may change to a limited pressure, and \( U_{\nu} \) may still be positive, and the motion stable; and so a motion is realized of a number of spinning tops, superposed in a column.

16. The Flexure Joint.—In Lord Kelvin's experiment the gyrostats are joined up by equal light rods and short lengths of elastic wire with rigid attachment to the rod and case of a gyrostat, so as to keep the system still, and free from entanglement and twisting due to precession of the fly-wheels.

When this gyrostatic chain is made to revolve with angular velocity \( n \) in relative equilibrium as a plane polygon passing through \( O \) the axis of rotation, each gyrostatic case moves as if its axis were driven by a force of friction due to an instantaneous angular velocity \( b \), and the components of angular velocity being \( n \) about \( O \), and \( n \) about the axis, the resultant angular velocity \( 2n \) is given by \( n \exp(i\theta) = 2n \sin \theta \); and the components of this angular velocity are

\[ \begin{aligned} -2n \sin \theta & = -n \cos \theta, \\
-2n \sin \theta & = n \sin \theta \end{aligned} \]

\[ \text{perpendicular to the axis of the case.} \]

The flexure joint behaves like a pair of equal bevel gears engaging.

The component angular momentum in the direction \( O \) is therefore

\[ \begin{aligned} L = -A \sin \theta \cos \theta - C n (1 - \cos \theta) \sin \theta + K \sin \theta, \\
L = -A \sin \theta \cos \theta - C n (1 - \cos \theta) \sin \theta + K \sin \theta \end{aligned} \]

\[ \text{and } L \text{ is therefore the couple acting on the gyrostat.} \]

If \( e \) denotes the angle which a connecting link makes with \( O \), and \( T \) denotes the constant component of the tension of a link parallel to \( O \), the couple acting is

\[ \begin{aligned} T \cos \theta (\tan a_{1} + \tan a_{2}) - 2 T \sin \theta, \\
T \cos \theta (\tan a_{1} + \tan a_{2}) - 2 T \sin \theta \end{aligned} \]

\[ \text{which is to be equated to } L, \text{ so that} \]

\[ \begin{aligned} -A \sin \theta \cos \theta - C n (1 - \cos \theta) \sin \theta + K \sin \theta \]

\[ \text{is to be equated to } T \cos \theta (\tan a_{1} + \tan a_{2}) + 2 T \sin \theta = 0. \]

In addition

\[ \begin{aligned} M \nu \times \nu + T \cos \theta (\tan a_{1} + \tan a_{2}) = 0, \\
M \nu \times \nu + T \cos \theta (\tan a_{1} + \tan a_{2}) = 0. \end{aligned} \]

with the geometrical relation

\[ \sin (a_{1} + a_{2}) \sin \theta = -2 n \sin \theta. \]

When the polygon is nearly coincident with \( O \), these equations can be replaced by

\[ \begin{aligned} A_{\nu} - K_{\nu} + 2 \tau_{\nu} - T_{\nu} (s_{\nu} + t_{\nu}) = 0, \\
M_{\nu} \tau_{\nu} - T_{\nu} (s_{\nu} - t_{\nu}) = 0, \end{aligned} \]

or

\[ (A + M_{\nu}^{2})^{2} - K_{\nu} + 2 \tau_{\nu} - T_{\nu} (s_{\nu} + t_{\nu}) = 0. \]
GYTHIUM—GYLA—FEHÉRVAR

GYTHIUM, the harbour and arsenal of Sparta, from which it was some 30 m. distant. The town lay at the N.W. extremity of the Laconian Gulf, in a small but fertile plain at the mouth of the Glythius. Its reputed founders were Heracles and Apollo, who frequently appear on its coins: the former of these names may point to the influence of Phocian traders, who, we know, visited the Laconian shores at a very early period. In classical times it was a community of perioci, politically dependent on Sparta, though doubtless with a municipal life of its own. In 455 B.C., during the first Peloponnesian War, it was burned by the Athenian admiral Tolmides. In 370 B.C. Epaminondas besieged it unsuccessfully for three days. Its fortifications were strengthened by the tyrant Nabûš, but in 195 B.C. it was invested and taken by Titus and Lucas Quinctius Cincinnatus, though recovered by Nabûš two or three years later, was re-captured immediately after his murder (192 B.C.) by Philopoemen and Aulus Atellius and remained in the Achaean League until its dissolution in 146 B.C. Subsequently it formed the most important of the Eleutherolachonian towns, a group of twenty-four, later eighteen, communities leagued together to maintain their autonomy against Sparta and declared free by Augustus. The highest officer of the confederacy was the general (ovarpygos), who was assisted by a treasurer (ṛāvlas), while the chief magistrates of the several communities bore the title of ephors (epo̱s).

Pausanias (iii. 21 f.) has left us a description of the town as it existed in the reign of Marcus Aurelius, the agora, the Acropolis, the island of Cranae (Marathonis) where Paris celebrated his nuptials with Helen, the Mignonum or precinct of Aphrodite Mignonitis (occupied by the modern town of Marathonis or Glythium), and the hill Larysium (Koumaro) rising above it. The numerous remains extant, of which the theatre and the buildings partially submerged by the sea are the most noteworthy, all belong to the Roman period.

The modern town is a busy and flourishing port with a good harbour protected by Cranae, now connected by a mole with the mainland: it is the capital of the prefecture (vōpolis) of Gyūlom with a population in 1907 of 61,522.

GYLA—FEHÉRVAR (Ger. Karlsruhe), a town of Hungary, in Transylvania, in the county of Alsó-Fehér, 73 m. S. of Kolozsvár by rail. Pop. (1900) 11,507. It is situated on the right bank of the Maros, on the outskirts of the Transylvanian Erzgebirge or Ore Mountains, and consists of the upper town, or citadel, and the lower town. Gyula-Fehérvar is the seat of a Roman Catholic bishop, and has a fine Roman Catholic cathedral, built in the 11th century in Romanesque style, and rebuilt in 1443 by John Hunyady in Gothic style. It contains among other tombs that of John Hunyady. Near the cathedral is the episcopal palace, and in the same part of the town is the Batthyaneum, founded by Bishop Count Batthyány in 1794. It contains a valuable library with many incunabula and old manuscripts, amongst which is one of the Nibelungenlied, an astronomical observatory, a collection of antiquities, and a mineral collection. Gyula-Fehérvar carries on an active trade in cereals, wine and cattle.

Gyula-Fehérvar occupies the site of the Roman colony Apulum. Many Roman relics found here, and in the vicinity, are preserved in the museum of the town. The bishopric was founded in the 11th century by King Ladislaus I. (1076–1093). In the 16th century, when Transylvania separated from Hungary, the town became the residence of the Transylvanian princes. From this period dates the castle, and also the buildings of the university, founded by Gabriel Bethlen, and now used as barracks. After the reversion of Transylvania in 1713 to the Habsburg monarchy the actual strong fortress was built in 1716–1735 by the emperor Charles VI, whence the German name of the town.
H—HAAKON

The eighth symbol in the Phoenician alphabet, as in its descendants, has altered less in the course of ages than most alphabetic symbols. From the beginning of Phoenician records it has consisted of two uprights connected by transverse bars, at first either two or three in number. The uprights are rarely perpendicular and the cross bars are not so precisely arranged as they are in early Greek and Latin inscriptions. In these the symbol takes the form of two rectangles H out of which the ordinary H develops by the omission of the cross bars at top and bottom. It is very exceptional for this letter to have more than three cross bars, though as many as five are occasionally found in N.W. Greeks. Within the same inscription the appearance of the letter often varies considerably as regards the space between and the length of the uprights. When only one bar is found it regularly crosses the uprights about the middle. In a few cases the rectangle is closed at top and bottom but has no middle cross bar Q. The Phoenician name for the letter was Hith (Hêt). According to Semitic scholars it had two values, (1) a glottal spurant, a very strong h, (2) an unvoiced velar spurant like the German ch in ach. The Greeks borrowed it with the value of the ordinary aspirate and with the name ἰχ. Very early in their history, however, most of the Greeks of Asia Minor lost the aspirate altogether, and having then no further use for the symbol with this value they adopted it to represent the long e-sound, which was not originally distinguished by a different symbol from the short sound (see E). With this value its name has always been ἰχα in Greek. The alphabet of the Asiatic Greeks was gradually adopted elsewhere. In official documents at Athens H represented the rough breathing or aspirate ' till 403 B.C.; henceforward it was used ὑ. The Western Greeks, however, from whom the Romans obtained their alphabet, retained their aspirate longer than those of Asia Minor, and hence the symbol came to the Romans with the value not of a long vowel but of the aspirate, which it still preserves. The Greek aspirate was itself the first or left-hand half of this letter H, while the smooth breathing ἰ was the right-hand portion I. At Tarentum H is found for H in inscriptions. The Roman aspirate was, however, a very slight sound which in some words where it was etymologically correct disappeared at an early date. Thus the cognate words of kindred languages show that the Lat. auster 'goose' ought to begin with h, but nowhere is it so found. In none of the Romance languages is there any trace of initial or medial h, which shows that vulgar Latin had ceased to have the aspirate by 400 B.C. The Roman grammarians were guided to its presence by the Sabine forms where h occurred; as the Sabines said faena (sand), it was recognised that the Roman form ought to be harena, and so for haedus (goat), hordeum (barley), &c. Between vowels h was lost very early, for ne-hemo (no man) is throughout the literature nemo, bi-himus (two winters old) bimus. In the Ciceronian age greater attention was paid to reproducing the Greek aspirates in borrowed words, and this led to absurd mistakes in Latin words, mistakes which were satirized by Catullus in his epigram (84) upon Arrius, who said chommoda for commoda and hinnidas for insidias. In Umbrian h was often lost, and also used without etymological value to mark length, as in comohota (=Lat. commoła), a practice to which there are some doubtful parallels in Latin.

In English the history of h is very similar to that in Latin. While the parts above the glottis are in position to produce a vowel, an aspirate is produced without vibration of the vocal chords, sometimes, like the pronunciation of Arrius, with considerable effort as a reaction against the tendency to "drop the h's." Though h survives in Scotland, Ireland and America as well as in the speech of cultivated persons, the sound in most of the vulgar dialects is entirely lost. Where it is not ordinarily lost, it disappears in unaccented syllables, as "Give it 'im" and the like. Where it is lost, conscious attempts to restore it on the part of uneducated speakers lead to absurd misplacements of h and to its restoration in Romance words when it never was pronounced, as humble (now recognized as standard English), humour and even honour.

(P. Gr.)

HAAG, CARL (1820— ), a naturalized British painter, court painter to the duke of Saxe-Coburg and Gotha, was born in Bavaria, and was trained in the academies at Nuremberg and Munich. He practised first as an illustrator and as a painter, in oil, of portraits and architectural subjects; but after he settled in England, in 1847, he devoted himself to water colours, and was elected associate of the Royal Society of Painters in Water Colours in 1850 and member in 1853. He travelled much, especially in the East, and made a considerable reputation by his firmly drawn and carefully elaborated paintings of Eastern subjects. Towards the end of his professional career Carl Haag quitted England and returned to Germany. See A History of the "Old Water-Colour" Society, now the Royal Society of Painters in Water Colours, by John Lewis Roteg (2 vols., London, 1891).

HAAKON (Old Norse Hækon), the name of several kings of Norway, of whom the most important are the following:—

HAAKON I., surnamed "the Good" (d. 961), was the youngest son of Harald Haarfager. He was fostered by King Aethelstan of England, who brought him up in the Christian religion, and on the news of his father's death in 933 provided him with ships and men for an expedition against his half-brother Erik, who had been proclaimed king. On his arrival in Norway Haakon gained the support of the landowners by promising to give up the rights of taxation claimed by his father over inherited real property. Erik fled, and was killed a few years later in England. His sons allied themselves with the Danes, but were invariably defeated by Haakon, who was successful in everything he undertook except in his attempt to introduce Christianity, which aroused an opposition he did not feel strong enough to face. He was killed at the battle of Fithe in 961, after a final victory over Erik's sons. So entirely did even his immediate circle ignore his religion that a court skald composed a poem on his death representing his welcome by the heathen gods into Valhalla.

HAAKON IV., surnamed "the Old" (1204-1263), was declared to be the son of Haakon III., who died shortly before the former's birth in 1204. A year later the child was placed under the protection of King Inge, after whose death in 1217 he was chosen king; though until 1223 the church refused to recognize him, on the ground of illegitimacy, and the Pope's dispensation for his coronation was not gained until much later. In the earlier part of his reign much of the royal power was in the hands of Earl Skule, who intrigued against the king until 1239, when he proceeded to open hostility and was put to death. From this time onward Haakon's reign was marked by more peace and prosperity than Norway had known for many years, until in 1263 a dispute with the Scottish king concerning the Hebrides, a Norwegian possession, induced Haakon to undertake an expedition to the west of Scotland. A division of his army seems to have repulsed a large Scottish force at Largs (though the later Scottish accounts claim this battle as a victory), and, having won back the Norwegian possessions in Scotland, Haakon was wintering in the Orkneys, when he was taken ill and died on the 15th of December 1263. A great part of his fleet had been scattered and destroyed by storms. The most important event in his reign was the voluntary submission of the Icelandic commonwealth. Worn out by internal strife fostered by Haakon's eunnuchs, the Icelandic chiefs acknowledged the Norwegian king as overlord in 1261. Their example was followed by the colony of Greenland.

HAAKON VII. (1872— ), the second son of Frederick VIII., king of Denmark, was born on the 3rd of August 1872, and was usually known as Prince Charles of Denmark. When in 1905 Norway decided to separate herself from Sweden the Norwegians
offered their crown to Charles, who accepted it and took the name of Haakon VII., being crowned at Trondheim in June 1906. The king married Maud, youngest daughter of Edward VII., king of Great Britain, their son, Prince Olav, being born in 1903.

HAARLEM, a town of Holland in the province of North Holland, on the Spaarne, having a Junction station 11 m. by rail W. of Amsterdam. It is connected by electric and steam tramways with Zandvoort, Leiden, Amsterdam and Alkmaar. Pop. (1900) 65,180. Haarlem is the seat of the governor of the province of North Holland, and of a Roman Catholic and a Jansenist bishopric. In appearance it is a typical Dutch town, with numerous narrow canals and quaintly gabled houses. Of the ancient city gates the Spaarnewouder or Amsterdam gate alone remains. Gardens and promenades have taken the place of the old ramparts, and on the south the city is bounded by the Frederiks and the Flora parks, between which runs the fine avenue called the Dreef, leading to the Haarlemmer Hout or wood. In the Frederiks Park is a pump-room supplied with a powerful chalybeate water from a spring, the first of the kind in Holland, in the Haarlemmer Polder not far distant, and in connexion with this there is an orthopaedic institution adjoining. In the great market place in the centre of the city are gathered together the larger number of the most interesting buildings, including the quaint old Fleshers' Hall, built by Lieven de Key in 1603, and now containing the archives; the town hall; the old Stadsoelen, where the burgesses met in arms; the Groote Kerk, or Great Church; and the statue erected in 1856 to Laurens Janszoon Koster, the printer. The Great Church, dedicated to St. Bavo, with a lofty tower (255 ft.), is one of the oldest in Holland, and dates from the end of the 13th and the beginning of the 16th centuries. Its great length (460 ft.) and the height and steepness of its vaulted cedar-wood roof (1538) are very impressive. The choir-stalls and screen (1510) are finely carved, and of further interest are the ancient pulpit sounding-board (1432), some old stained glass, and the small models of ships, copies dating from 1638 of yet earlier models originally presented by the Dutch-Swedish Trading Company. The church organ was long considered the largest and finest in existence. It was constructed by Christian Müller in 1738, and has 4 keyboards, 64 registers and 3000 pipes, the largest of which is 9 ft. in diameter and 32 ft. long. Among the monuments in the church are those of the poet Willem Bilderdyk (d. 1831) and the engineer Frederik Willem Conrad (d. 1808), who designed the sea-sluices at Katwyk. In the belfry are the damastijsten, small bells presented to the town, according to tradition, by William I., count of Holland (d. 1222), the crusader. The town hall was originally a palace of the counts of Holland, begun in the 12th century, and some old 13th-century beams still remain; but the building was remodelled in the beginning of the 17th century, when it was joined to the old town hall, and dates from the end of the 17th and the beginning of the 18th centuries. Its great length (460 ft.) and the height and steepness of its vaulted cedar-wood roof (1538) are very impressive. The choir-stalls and screen (1510) are finely carved, and of further interest are the ancient pulpit sounding-board (1432), some old stained glass, and the small models of ships, copies dating from 1638 of yet earlier models originally presented by the Dutch-Swedish Trading Company. The church organ was long considered the largest and finest in existence. It was constructed by Christian Müller in 1738, and has 4 keyboards, 64 registers and 3000 pipes, the largest of which is 9 ft. in diameter and 32 ft. long. Among the monuments in the church are those of the poet Willem Bilderdyk (d. 1831) and the engineer Frederik Willem Conrad (d. 1808), who designed the sea-sluices at Katwyk. In the belfry are the damastijsten, small bells presented to the town, according to tradition, by William I., count of Holland (d. 1222), the crusader. The town hall was originally a palace of the counts of Holland, begun in the 12th century, and some old 13th-century beams still remain; but the building was remodelled in the beginning of the 17th century, when it was joined to the old town hall, and dates from the end of the 17th and the beginning of the 18th centuries.

There are a museum of ecclesiastical antiquities, chiefly relating to the bishopric of Haarlem; the old weigh-house (1598) and the orphanage for girls (1608), originally an almshouse for old men, both built by the architect Lieven de Key of Ghent.

The staple industries of Haarlem have been greatly modified in the course of time. Cloth weaving and brewing, which once flourished exceedingly, declined in the beginning of the 16th century. A century later, silk, lace and damask weaving were introduced by French refugees, and became a very important industry. But about the close of the 18th century this remarkable prosperity had also come to an end, and it was not till after the Belgian revolution of 1830-1831 that Haarlem began to develop the manufactures in which it is now chiefly engaged. Cotton manufacture, dyeing, printing, bleaching, brewing, type-foundering, and the manufacture of tram and railway carriages are among the more important of its industries. One of the printing establishments has the reputation of being the oldest in the Netherlands, and publishes the oldest Dutch paper, De Oproagers, Haarlemmer Courant. Market-gardening, especially horticulture, is extensively practised in the vicinity, so that Haarlem is the seat of a large trade in Dutch bulbs, especially hyacinths, tulips, fritillaries, spireas and japonicas.

Haarlem, which was a prosperous place in the middle of the 12th century, received its first town charter from William II., count of Holland and king of the Romans, in 1245. It played a considerable part in the wars of Holland with the Frisians. In 1492 it was captured by the insurgent peasants of North Holland, was re-taken by the duke of Saxony, the imperial governor, in 1519, and by 1647 the new Haarlem industries had joined the revolt of the Netherlands against Spain, but on the 13th of July 1573, after a seven months' siege, was forced to surrender to Alva's son Frederick, who exacted terrible vengeance. In 1577 it was again captured by William of Orange and permanently incorporated in the United Netherlands.

See Karl Hegel, Städte und Gülden (Leipzig, 1881): Allan, Geschiedenis en beschrijving van Haarlem (Haarlem, 1871-1888).

HAARLEM LAKE (Dutch Haarlemmer Meer), a commune of the province of North Holland, constituted by the law of the 16th of July 1855. It has an area of about 46,400 acres, and its population increased from 7,237 in 1860 to 16,671 in 1900. As its name indicates, the commune was formerly a lake, which is said to have been a relic of a northern arm of the Rhine which passed through the district in the time of the Romans. In 1531 the Haarlemmer Meer had an area of 6,430 acres, and in its vicinity were three smaller sheets of water—the Leidsche Meer or Leiden Lake, the Spiering Meer, and the Oude Meer or Old Lake, with a united area of about 7,600 acres. The four lakes were formed into one by successive inundations, whole villages and whole parishes being destroyed in the process. The Haarlem Lake had an area of about 37,000 acres, which a century later was increased to over 42,000 acres. As early as 1643 Jan Adriaenszoon Leeghwater proposed to endike and drain the lake; and similar schemes, among which those of Nikolaas Samuel Cruquius in 1742 and of Baron van Lijnaden van Hemmen in 1820 are worthy of special mention, were brought forward from time to time. But it was not until a furious hurricane in November 1836 drove the waters as far as the gates of Amsterdam, and another on Christmas Day sent them in the opposite direction to submerge the streets of Leiden, that the mind of the nation was seriously turned to the matter. In August 1837 the king appointed a royal commission of inquiry; the scheme proposed by the commission received the sanction of the Second Chamber in March 1839, and in the following May the work was begun. A canal was first dug round the lake for the reception of the water and the accommodation of the great traffic which had previously been carried on. This canal was 38 m. in length, 123-146 ft. wide, and 8 ft. deep, and the earth which was taken out of it was used to build a dike from 30 to 54 yds. broad containing the lake. The area enclosed by the canal was rather more than 70 sq. m., and the average depth of the lake 13 ft. 53 in., and as the water had no natural outfall it was calculated that probably 1000 million tons would have to be raised by mechanical means.
This amount was 200 million tons in excess of that actually discharged. Pumping by steam-engines began in 1848, and the lake was dry by the 1st of July 1852. At the first sale of the highest lands along the banks on the 16th of August 1853, about £28 per acre was paid; but the average price afterwards was less. The whole area of 42,096 acres recovered from the waters brought in 9,400,000 florins, or about £80,000, exactly covering the cost of the enterprise; so that the actual cost to the nation was only the amount of the interest on the capital, or about £60,000. The sandy loamy soil of various kinds, is very clairy and park; most of it is sufficiently fertile, though in the lower portions there are barren patches where the scanty vegetation is covered with an ochreous deposit. Mineral springs occur containing a very high percentage (3-245 grams per litre) of common salt; and in 1839 a company was formed for working them. Corn, seeds, cattle, butter and cheese are the principal produce. The roads which traverse the commune are bordered by pleasant-looking farm-houses built after the various styles of Holland, Friesland or Brahant. Hoofddorp, Vennependorp or Nieuw Venneken, Abbenes and the vicinities of the pumping-stations are the spots where the population has clustered most thickly. The first church was built in 1855; in 1877 there were seven. In 1854 the city of Leiden laid claim to the possession of the new territory, but the courts decided in favour of the nation.

**Haase, Friedrich (1827-1898)**, German actor, was born on the 1st of November 1827, in Berlin, the son of a valet to King Frederick William IV., who became his godfather. He was educated for the stage under Ludwig Tieck and made his first appearance Verden in 1843, and in Weimar, afterwards acting at Prague (1849-1851) and Karlsruhe (1852-1855). From 1856 to 1866 he played in St Petersburg, then was manager of the court theatre in Coburg, and in 1869 (and again in 1882-1883) visited the United States. He was manager of the Stadt Theater in Leipzig from 1870 to 1876, when he removed to Berlin, where he devoted his energies to the foundation and management of the Deutsches Theater. He finally retired from the stage in 1886. Haase's aristocratic appearance and elegant manner fitted him specially to play high comedy parts. His chief roles were those of Rochefort in the Partie Pique; Richelieu; Savigny in *Der deiner Diplomat* and der Fürst in *Der geheime Agent*. He is the author of *Ungeschminkte Briefe* and *Was ich erlebte 1846-1898* (Berlin, 1898).

See Simon, Friedrich Haase (Berlin, 1898).

**Haase, Friedrich Gottlob (1806-1867)**, German classical scholar, was born at Magdeburg on the 4th of January 1806. Having studied at Halle, Greifswald and Berlin, he on the 19th May 1830 was appointed assistant professor at the University of Greifswald for identifying himself with the *Burschenschaften* (students' associations). Having been released after serving one year of his sentence, he visited Paris, and on his return in 1840 he was appointed professor at Breslau, where he remained till his death on the 16th of August 1867. He was undoubtedly one of the most successful teachers of his day in Germany, and exercised great influence upon all his pupils.

He edited several classic authors: Xenophon (Ἀκαδημιακοὶ ψωλεία, 1833); Thucydides (1840); Velleius Paterculus (1858); Seneca the philosopher (2nd ed., 1872, not yet superseded); and Tacitus (1855), the introduction to which is a masterpiece of Latinity. His Vorlesungen über das lateinische Sprachenwesen was published after his death by F. A. Eckstein and H. Peter (1874-1880). See C. Burslan, *Geschichte der klassischen Philologie in Deutschland* (1883); G. Friederich, *Briefe Heinrich von Kleist* (1868, 1869), with a list of works; T. Oesler in *Rübezahl: Schlesische Provinzialblätter*, vii. Heft 3 (Breslau, 1868).

**Haast, Sir Johann Franz Julius von (1824-1847)**, German and British geologist, was born at Bonn on the 1st of May 1824. He received his early education partly in that town and partly in Cologne, and then entered the university at Bonn, where he made a special study of geology and mineralogy. In 1836 he started for New Zealand to report on the suitability of the colony for German emigrants. He then became acquainted with Dr von Hochstetter, and rendered assistance to him in the preliminary geological survey which von Hochstetter had undertaken. Afterwards Dr Haast accepted offers from the governments of Nelson and Canterbury to investigate the geology of those districts, and the results of his detailed labours greatly enriched our knowledge with regard to the rocky structure, the glacial phenomena and the economic products. He discovered gold and coal in Nelson, and he carried on important researches with reference to the occurrence of Dinornis and other extinct wingless birds (Moas). His *Geology of the Provinces of Canterbury and Westland*, N.Z., was published in 1867. He was the founder of the Canterbury museum at Christchurch, of which he became director, and which he endeavoured to render the finest collection in the southern hemisphere. He was surveyor-general of Canterbury from 1861 to 1871, and professor of geology at Canterbury College. He was elected F.R.S. in 1876; and he was knighted for his services at the time of the colonial exhibition in London in 1887. He died at Wellington, N.Z., on the 15th of August 1887.

**Hababs (As-Habbeh), a nomadic pastoral people of Habitic stock, living in the coast region north-west of Massawa. Physically they are Beja, by language and traditions Abyssinians. They were Christians until the 16th century, but are now Mahomedans. Their sole wealth consists in cattle.**

**Habakkuk**, the name borne by the eighth book of the Old Testament "Minor Prophets." It occurs twice in the book itself (i., ii., iii.) in titles, but nowhere else in the Old Testament. The meaning of the name is uncertain. If Hebrew, it might be derived from the root הוב (to embrace) as an intensive term of affection. It has also been connected more plausibly with an Assyrian plant name, hababāku. (Delitzsch, *Handwörterbuch*, p. 281). The Septuagint has ᾿ὑβακοῦ. Of the person designated, no more than may be known is inferred from the writing which bears his name. Various legends are connected with him, of which the best known is given in the Apocryphal story of "Bel and the Dragon" (v. 33-39); but none of these has any historic value.

The book itself falls into three obvious parts, viz. (1) a dialogue between the prophet and God (i. 2-11); (2) a series of five woes pronounced on wickedness (ii. 5-ii. 20); (3) a poem describing the triumphant manifestation of God (iii.). There is considerable difficulty in regard to the interpretation of (1), on which that of (2) will turn; while (3) forms an independent section, to be considered separately.

In the dialogue, the prophet cries to God against continued violence and injustice, though it is not clear whether this is done within or to Israel (i. 2-4). The divine answer declares that God raises up the Chaldeans, whose formidable resources are invincible (ii. 5-11). The prophet thereupon calls God's attention to the tyranny which He apparently allows to triumph, and declares that God will punish the wicked who settle their accounts with Him (i. 2). God answers by demanding patience, and by declaring that the righteous shall live by his faithfulness (ii. 3-4).

The interpretation of this dialogue which first suggests itself is that the prophet is referring to wickedness within the nation, which is to be punished by the Chaldeans as a divine instrument; in the process, the tyranny of the instrument itself calls for punishment, which the prophet is bidden to await in patient fidelity. On this view of the dialogue, the subsequent woes will be pronounced against the Chaldeans, and then God's answer to the prophet will be (ii. 3-4). God answers by demanding patience, and by declaring that the righteous shall live by his faithfulness (ii. 3-4).

The interpretation of this dialogue which first suggests itself is that the prophet is referring to wickedness within the nation, which is to be punished by the Chaldeans as a divine instrument; in the process, the tyranny of the instrument itself calls for punishment, which the prophet is bidden to await in patient fidelity. On this view of the dialogue, the subsequent woes will be pronounced against the Chaldeans, and then God's answer to the prophet will be (ii. 3-4). God answers by demanding patience, and by declaring that the righteous shall live by his faithfulness (ii. 3-4).

Grave objections, however, confront this interpretation, as is admitted even by such recent defenders of it as Davidson and Driver. Is it likely that a prophet would begin a complaint against Chaldean tyranny (admittedly central in the prophecy) by complaining of that wickedness of his fellow-countrymen which seems partly to justify it? Are not the terms of reference in

1 These legends are collected in Hastings, *D. B.*, vol. ii. p. 272. He is the watchman of Isa. xxi. 6 (cf. Hab. ii. 1); the son of the (admittedly a Knebe on account of its hair to carry his own dinner to Daniel in the lions' den (supra).
which carries no more intrinsic weight than the Davideic titles of the Psalms. The poem begins with a prayer that God will renew the historic manifestation of the exodus, which inaugurated the national history and faith; a thunderstorm moving up from the south is then described, in which God is revealed (3-7); it is asked whether this manifestation, whose course is further described, is against nature only (8-11); the answer is given that it is for the salvation of Israel against its wicked foes (12-15); the poet describes the effect in terror upon himself and declares his confidence in God, even in utter agricultural adversity (17-19). As Wellhausen says (p. 171): "The poet appears to believe that in the very act of describing enthusiastically the ancient deed of deliverance, he brings home to us the new; we are left sometimes in doubt whether he speaks of the past to suggest the new by analogy, or whether he is concerned directly with the future, and simply paints it with the colours of the past."

In any case, there is nothing in this fine poem to connect it with the conception of the Chaldaeans as a divine instrument. It is the nation that speaks through the poet (cf. v. 14), but at what period of its post-exilic history we have no means of inferring.

Our estimate of the theological teaching of this book will naturally be influenced by the particular critical theory which is adopted. The reduction of the book to four originally independent sections requires that the point of each be stated separately. When this is done, it will, however, be found that there is a broad unity of subject, and of natural development in its treatment, such as to some extent justifies the instinct or the judgment of those who were instrumental in effecting the division. The whole seems, however, to have been for the most part written in analogy, as is indicated by the fact that even G. A. Smith, who follows it, suggests "Egypt from 608-603" as an alternative to Assyria (p. 124).

(3) Marti (1904) abandons the attempt to explain the prophecy as a unity, and analyses it into three elements, viz. (a) the original prophecy by Habakkuk, consisting of i. 5-10, 14 f., belonging to the year 605, and representing the emergent power of the Chaldaeans as a divine scourge of the faithless people; (b) Woes against the Chaldaeans, presupposing not only tyrannous rule over many peoples, but the beginning of their decline and fall, and therefore of date about 540 b.c. (ii. 5-19); (c) The prophet, set to Shigionoth (i. 5-10), the supercession ("For the chief musician, on stringed instruments") and the insertion of the musical term "Selah" in three places (v. 3, 9, 13). These liturgical notes make extremely probable the supposition that the poem has been taken from some collection like that of our present book of Psalms, probably on the ground of the authorship asserted by the supercession there attached to it. It cannot, however, be said that the poem itself supports this assertion, if followed by Peake in The Problem of Suffering, pp. 4 f., 151 f., to whose appendix (A) reference may be made for further details of recent criticism.

(4) For the less probable theories of Rothstein, Lauterburg, Huppel and Peiser (amongst others), cf. Marti’s Commentary, pp. 328 f. and 332. Stevenson (The Expositor, 1902) states clearly the difficulties for those who adopt this view, as a unity. He sees two independent sections, 2-4, 12-13, and 5-11; 14-17.
is well known (Rom. i. 17; Gal. iii. 11; Heb. x. 38) though the difference is apt to be exaggerated by those who forget how much of the element of ἡσυχία lies in Paul's conception of πάντως. In G. A. Smith's words, "as Paul's adaptation, the just shall live by faith," has become the motto of evangelical Christianity, so we may say that Habakkuk's original of it has been the motto and the name of Judaism: 'the righteous shall live by his faithfulness.'"

"HABDALA" (lit. "separation"), a Hebrew term chiefly appropriated to ceremonies at the conclusion of Sabbath and festivals, marking the separation between times sacred and secular. On the Saturday night the ceremony consists of three items: (a) benediction over a cup of wine (common to many other Jewish functions); (b) benediction over a lighted taper, of which possibly the origin is utilitarian, as no light might be kindled on the Sabbath day, but the rite may be symbolical; and (c) benediction over a box of sweet-smelling spices. The origin of the latter has been traced to the bowl of burning spices which in Talmudic times was introduced after each meal. But here too symbolic ideas must be taken into account. Both the light and the spices would readily fit into the conception of the Sabbath "Over-soul" of the mystics. (I. A.)

HABEAS CORPUS, in English law, a writ issued out of the High Court of Justice commanding the person to whom it is directed to bring the body of a person in his custody before that or some other court for a specified purpose. There are various forms of the writ, of which the most famous is that known as habeas corpus ad subiciendum, the well-established remedy for violation of personal liberty. From the earliest records of the English law no free man could be detained in custody except on a criminal charge or conviction or for a civil debt. That right is expressed in the Great Charter in the words: "Nullus liber homo capiatur vel imprisonetur aut dissaisetetur aut ulterius et aut aliud quo modo destruetur nec super eum ibimus nec super eum militemus, nisi per legale judicium parium suorum, vel per legem terrae." The writ is a remedial mandatory writ of right existing by the common law, i.e. it is one of the ordinary remedies—such as mandamus, certiorari, and prohibitions, which the superior courts may grant. While "of right," it is not "of course," and is granted only on showing special cause. The ground of its institution is the oath sworn statement of facts setting up at least a probable case of illegal confinement. It is addressed to the person in whose custody another is detained, and commands him to bring his prisoner before the court immediately after the receipt of the writ, together with the day and cause of his being taken and detained, to undergo and receive (ad subiciendum et recipiendum) whatsoever the court awarding the writ "may consider of concerning him in that behalf."

It is often stated that the writ is founded on the article of the Charter already quoted; but there are extant instances of the issue of writs of habeas corpus before the charter. Other writs having somewhat similar effect were in use at an early date, e.g. the writ de odio et atid, used as early as the 12th century to prevent imprisonment on vexatious appeals of felony, and the writ of mainprise (de manuceptione), long obsolete if not abolished in England but which it was attempted to use in India so late as 1870. In the case of imprisonment on accusation of crime the writ issued from the court of king's bench (or from the chancery), and on its return the court judged of the legality of the imprisonment, and discharged the prisoner or admitted him to bail or imprisonment, according to the result of the examination.

By the time of Charles I. the writ was fully established as the appropriate process for checking illegal imprisonment by inferior courts or by public officers. But it acquired its full and present constitutional importance by legislation.

In Darnel's case (1627) the judges held that the command of the king was a sufficient answer to a writ of habeas corpus. The House of Commons thereupon passed resolutions to the contrary. Lord Clarendon was impeached by the House of Lords the measure known as the Petition of Right was passed (1627, 3 Car. i. c. i.) which, inter alia, recited (s. 5) that, contrary to the Great Charter and the good laws and statutes of the realm, divers of the king's subjects had of late been imprisoned without any cause shown, and when they were brought up on habeas corpus ad subiciendum, and no cause was shown other than the special command of the king signified by the privy council, were nevertheless remanded to prison, and enacted "that no freeman in any such manner as is before mentioned be imprisoned or detained."

The Petition of Right was disregarded in Selden's case (1629), when it was successfully returned to a habeas corpus that Selden and others were committed by the king's special command "for notable contempts against the king and his government and for stirring up sedition against him."

This led to legislation in 1640 by which, after abolishing the Star Chamber, the right to a habeas corpus was given to test the legality of commitments by command or warrant of the king or the privy council.

The reign of Charles II. was marked by further progress towards securing the freedom of the subject from wrongful imprisonment. Lord Clarendon was impeached, inter alia, for causing many persons to be imprisoned against law and to be conveyed in custody to places outside England. In 1668 a writ of habeas corpus was issued to test the legality of an imprisonment in Jersey. Though the authority of the courts had been strengthened by the Petition of Right and the act of 1640, it was still rendered insufficient by reason of the insecurity of judicial tenure, the fact that only the chancellor (a political as well as a legal officer) and the court of king's bench had undoubted right to issue the writ, and the inability or hesitation of the competent judges to issue the writ except during the legal term, which did not cover more than half the year. A series of bills was passed through the Commons between 1668 and 1675, only to be rejected by the other House. In Jenke's case (1676) Lord Chancellor Nottingham refused to issue the writ in vacation in a case in which a man had been committed by the king in council for a speech at Guildhall, and could get neither bail nor trial. In 1679, but rather in consequence of Lord Clarendon's arbitrary proceedings than of Jenke's case, a fresh bill was introduced which passed both Houses (it is said the upper House by the counting of one stout peer as ten) and became the famous Habeas Corpus Act of 1679 (31 Car. ii. c. 2). The passing of the act was largely due to the experience and energy of Lord Shaftesbury, after whom it was for some time called. The act, while a most important landmark in the constitutional history of England, in no sense creates any right to personal freedom, but is essentially a procedure act for improving the legal mechanism by means of which that acknowledged right may be enforced.

3 Ibid. c. ix. (12th ed.) p. 98.

HABEAS CORPUS

It declares no principles and defines no rights; but is for practical purposes worth a hundred articles guaranteeing constitutional liberty. In the manner characteristic of English legislation the act is limited to the particular grievances immediately in view and is limited to imprisonment for criminal or supposed criminal matters, leaving untouched imprisonment on civil process or by private persons. It recites that great delays have been used by sheriffs and gaolers in making returns of writs of habeas corpus directed to them; and for the prevention thereof, and the more speedy relief of all persons imprisoned for criminal or supposed criminal matters, it enacts in substance as follows: (1) When a writ of habeas corpus is directed to a sheriff or another person in charge of a prisoner, he must within 3, 10 or 20 days, according to the distance of the place of commitment, bring the body of his prisoner to the court, with the true cause of his detainer or imprisonment—unless the commitment was for treason or felony plainly expressed in the warrant of commitment. (2) If any person be committed for any crime—unless for treason or felony plainly expressed in the warrant—it shall be lawful for such person or persons (other than persons convicted or in execution by legal process) in time of vacation, to appeal to the lord chancellor as a judge, who shall issue a habeas corpus returnable immediately, and on the return thereof shall discharge the prisoner on the applicant's being satisfied as to his legal arrest and commitment, unless he is committed in lieu of fine or otherwise under a statute or to prevent his escape or to keep him for trial, or unless the return shall be false, the courts may refuse the writ; and it is provided that no commitment for debt is to be held illegal or void on affidavit that the witnesses for the crown are not ready; and if he is not indicted and tried in the second term or session after commitment, or if after trial he is acquitted, he shall be discharged from imprisonment. (5) No inhabitant of England (except persons contracting, or, after conviction for felony, electing to be transported) shall be sent prisoner to Scotland, Ireland, Jersey, &c., or any place beyond the seas. Stringent penalties are provided for offences against the act. A judge delaying habeas corpus forfeits £500 to the party aggrieved. Illegal imprisonment beyond seas renders the offender liable in an action by the injured party to treble costs and damages to the extent of not less than £500, besides subjecting him to the penalties of praemunire and to other disabilities. "The great rank of those who were likely to offend against this part of the statute was," says Hallam, "the cause of this unusual severity." Indeed as early as 1591 the judges had complained of the difficulty of enforcing the writ in the case of imprisonment at the instance of magnates of the realm. The effect of the act was to impose upon the judges under severe sanction the duty of protecting personal liberty in the case of criminal charges and of securing speedy trial upon such charges when legally framed; and the improvement of their tenure of office at the revolution, coupled with the veto put by the Bill of Rights on excessive bail, gave the judicature the independence and authority necessary to enable them to keep the executive within the law and to restrain administrative development of the scope or penalties of the criminal law; and this power of the judiciary to control the executive, coupled with the limitations on the right to set up "act of state" as an excuse for infringing individual liberty is the special characteristic of English constitutional law.

It is to be observed that neither at common law nor under the act of 1679 was the writ the appropriate remedy in the case of a person convicted either on indictment or summary. It properly applied to persons detained before or without trial or sentence; and for convicted persons the proper remedy was by writs of
derror or certiorari to which a writ of habeas corpus might be used as ancillary.

As regards persons imprisoned for debt or on civil process the writ was available at common law to test the legality of the detention: but the practice in these cases is unaffected by the act of 1679, and is of no present interest, since imprisonment on civil process is almost abolished. As regards persons in private custody, e.g. persons not sui juris detained by those not entitled to their guardianship or lunatics, or persons kidnapped, habeas corpus ad subjiciendum seems not to have been the ordinary common law remedy. The appropriate writ for such cases was that known as de homine replegiando. The use of this writ in most if not all criminal cases was forbidden in 1533; but it was revived in the 17th century in a case of kidnapping (Desaguis's case, 1682), and against Lord Grey for abducting his wife's sister (1682), and in the earl of Banbury's case to recover his wife (1704). The latest recorded instance of its use is Trebilcock's case (1756), in which a ward sought to free himself from the custody of his guardian.

Since that date the habeas corpus ad subjiciendum has been used in cases of illegal detention in private custody. In 1758 questions arose as to its application to persons in naval or military custody, including pressed men, which led to the introduction of a bill in parliament and to the consultation by the House of Lords of persons qualified to examine into the truth of the case. When the writ was used to release the wife of Earl Ferrers from his custody and maltreatment, and was unsuccessfully applied for by John Wilkes to get back his wife, who was separated from him by mutual agreement. But perhaps the most interesting instances of that period are the case of the negro Somerset (1771), who was released from a claim to hold him as a slave in England; and that of the Hottentot Venus (1810), where an alien woman on exhibition in England was brought before the court by Zachary Macaulay in order to ascertain whether she was detained against her will.

The experience of the 18th century disclosed defects in the procedure for obtaining liberty in cases not covered by the act of 1679. But it was not till 1816 that further legislation was passed for more effectually securing the liberty of the subject. The act of 1816 (56 Geo. III. c. 100), does not touch cases covered by the act of 1679. It enacts (1) that a writ of habeas corpus shall be issued in vacation time in favour of a person restrained of his liberty otherwise than for some criminal or supposed criminal matter (except persons imprisoned for debt or by civil process); (2) that the return to the writ be good and sufficient if the judge shall examine into the truth of the facts stated in such return, and if they appear sufficient the prisoner shall be bailed; (3) that the writ shall run to any port, harbour, road, creek or bay on the coast of England, although not within the body of any county. The last clause was intended to meet doubts on the applicability of habeas corpus in cases of illegal detention on board ship, which had been raised owing to a case of detention on a foreign ship in an English port.

It will appear from the foregoing statement that the issue and enforcement of the writ rests on the common law as strengthened by the acts of 1679, 1840, 1879 and 1816, and subject also to the regulations as to procedure contained in the Criminal Office Rules, 1906. The effect of the statutes is to keep the courts always open for the issue of the writ. It is available to put an end to all forms of illegal detention in public or private custody. In the case of the Canadian prisoners (1839) it was used to obtain the release of persons sentenced in Canada for participating in the rebellion of 1837, who were being conveyed throughout England in custody on their way to imprisonment in another part of the empire, and it is matter of frequent experience for the judges to review the legality of commitments under the Extradition Acts and the Fugitive Offenders Act 1885, of fugitives from the justice of a foreign state or parts of the king's dominions outside the British Islands.

In times of public danger it has occasionally been thought necessary to "suspend" the Habeas Corpus Act 1679 by special and temporary legislation. This was done in 1794 (by an act
HABERDASHER

786 annually renewed until 1801) and again in 1817, as to persons arrested and detained by his majesty for conspiring against his person and government. The same course was adopted in Ireland in 1866 during a Fenian rising. It has been the practice to make such acts annual and to follow their expiration by an act of indemnity. In cases where martial law exists the use of the writ is ex hypolhesis suspended during conditions amounting to a state of war within the realm or the British possession affected (e.g. the Cape Colony and Natal during the South African War) and it would seem that the acts of courts martial during the period are not the subject of review by the ordinary courts.

The so-called "suspension of the Habeas Corpus Act" bears a certain similarity to what is called in Europe "suspending the constitutional guarantees" or "proclaiming a state of siege," but "is not in reality more than suspension of one particular remedy for the protection of personal freedom."

There are various other forms of the writ according to the purpose for which it is granted. Thus habeas corpus ad respondendum is used to bring a prisoner confined by the process of an inferior court in order to charge him in another proceeding (civil or criminal) in the superior court or other court. As regards civil proceedings, this form of the writ is now rarely used. It is, however, still occasionally used to bring an accused person in custody for debt or in execution of a civil judgment. The writ is also, in point of fact, being more and more generally used for the purpose of bringing a person in custody for debt or on a criminal charge before a criminal court to be charged in respect of a criminal proceeding; but the same result may be obtained by an ordinary process of arrest and summons to appear in the county court, under 1432. In the case of 11 of the Prison Act 1898, or by the written order of a court of criminal jurisdiction before which he is required to take his trial on indictment (Civil Law Amendment Act 30 & 31 Vict. c. 35, s. 10).

Other forms are ad satisfaciendum; ad faciendum et recipiendum, to remove into a superior court proceedings under which the defendant is in custody; ad testificandum, where a prisoner is remanded for a witness, issued under an act of 1804 (s. 11), which is in practice replaced by orders under s. 11 of the Prison Act 1898 (supra) or the order for an order for an order for ad testificandum et recipiendum, to authorize the transfer of a person in custody to another for purposes of trial, which is in practice superseded by the provisions of the Prison Acts 1865, 1871 and 1898, and the Criminal Law Amendment Act 1876 (supra).

The above forms are now of little or no importance; but the procedure for obtaining them and the writs of which they are included in the Crown Office Rules (1905).

Ireland.—The common law of Ireland is as to the writs of habeas corpus the same as is that in England. The writ has in past times been issued from the English court of king's bench into Ireland; but such writs are not now used. The petition of right of 1678 and 1681 and habeas corpus ad respondendum are applied to Ireland. The Petition of Right is not in term applicable to Ireland. The Habeas Corpus Act 1679 does not apply to Ireland; but its equivalent is supplied by an act of 1761-1762 of the Irish parliament. Under the act of 1761-1762 the prisoner is remanded for a witness, issued under an act of 1804 (s. 11), which is in practice replaced by orders under s. 11 of the Prison Act 1898 (supra) or the order for ad testificandum et recipiendum, to authorize the transfer of a person in custody to another for purposes of trial, which is in practice superseded by the provisions of the Prison Acts 1865, 1871 and 1898, and the Criminal Law Amendment Act 1876 (supra).

This act continued by annual renewals until 1906, when it expired.

Scotland.—The writ of habeas corpus is unknown to Scots law, nor will it be found in the Early English Usages. Under a Scots act of 1701 (c. 6) provision is made for preventing wrongful imprisonment and against undue delay in trials. It was applied to treason cases in 1848. The right to speedy trial is now regulated by s. 43 of the Criminal Procedure Scotland Act 1897. The remedies are as at Scotland equivalent to the English Act of 1769. Under the Court of Exchequer Scotland Act 1856 (19 & 20 V. c. 56) provision is made for bringing before the courts of record in Scotland proceedings before inferior courts and public officers—which is equivalent to the powers to issue habeas corpus in such cases out of the English court of exchequer (now the revenue side of the king's bench division). The courts of the kingdom of Scotland, particularly the Court of Session, have long been accustomed to hold habeas corpus proceedings, and have also a secret court. A secret court has also been created for the same purpose by the Habeas Corpus Act 1878 to which the power of issue of the writ of habeas corpus has been transferred from the English courts.

British Possessions.—The act of 1679 expressly applies to Wales, Berwick-on-Tweed, Jersey and Guernsey, and the act of 1816 also extends the writ to all parts of the empire. The writ of habeas corpus has also been issued to the king's foreign dominions and to some parts of the empire, as to California, of which the writ is issued on the 23rd of November, 1869, and to other countries, such as Chile, Portugal, and Brazil, in the years 1874, 1876, 1878, 1880, and 1882. The writ of habeas corpus has also been issued to the king's foreign dominions and to some parts of the empire, as to Hawaii, of which the writ is issued on the 23rd of November, 1869, and to other countries, such as Chile, Portugal, and Brazil, in the years 1874, 1876, 1878, 1880, and 1882.
drapers' shops. The word, found in Chaucer, and even earlier (1311), is of obscure origin; the suggestion that it is connected with an Icelandic habitrask, "haversack," is, according to the New English Dictionary, impossible. Habertz occurs in an early Anglo-French customs list, which includes articles such as were sold by haberdashers, but this word may itself have been a misspelling of "habarder." The obscurity of origin has left room for many conjectures such as that of Minshew that "haberdasher" was perhaps merely a corruption of the German Hhabter das. "Have you that?" or Haber das, Herr. "Have that, sir," used descriptively for a general dealer in household wares. The haberdashers' companies are one of the greater Livery Companies of the City of London. Originally a branch of the mercers, the fraternity took over the selling of "small wares," which included not only articles similar to those sold as "haberdashery" now, but such things as gloves, daggers, glass, pens, lanterns, mossetaps, and the like. They were thus on this side connected with the Milliners. On the other hand there was early a fusion with the old gild of the "Hurres," or cap makers, and the hatters, and by the reign of Henry VII. the amalgamation was complete. There were long recognized two branches of the trade, that of the hatters, termed "Hatteres," and that of the haberdashers of hats (see further LIVERY COMPANIES). The haberdashers are named, side by side with the capellarii, in the White Book (Liber Albus) of the city of London (see Munita Gildhallae Londinensis, ed. H. T. Ridley, Rolls Series, 12, 1895-1896), and a haberdasher forms one of the company of pilgrims in the Canterbury Tales (Prologue, 361).

HABINGTON, WILLIAM (1605-1654), English poet, was born at Hendlip Hall, Worcestershire, on the 4th of November 1605. He belonged to the well-known Catholic family. His father, Thomas Habington (1560-1647), an antiquary and historical scholar, had been implicated in the plots on behalf of Mary queen of Scots; his uncle, Edward Habington, was hanged in 1586 on the charge of conspiring against Elizabeth in connexion with Anthony Babington; while to his mother, Mary Habington, was attributed the revelation of the Gunpowder Plot. The poet was sent to the college at St Omer, but, pressure being brought to bear on him to induce him to become a Jesuit, he removed to Paris. He married about 1632 Lucy, second daughter of Sir William Herbert, first Baron Powys. This lady he had addressed in the volume of lyrical poems arranged in two parts and entitled Castara, published anonymously in 1634. In 1635 appeared a second edition enlarged by three prose characters, fourteen new lyrics and eight touching elegies on his friend and kinsman, George Talbot. The third edition (1640) contains a third part consisting of a prose character of "A Holy Man" and twenty-two devotional poems. Habington's lyrics are full of the far-fetched "conceits" which were fashionable at court, but his verse is quite free from the prevailing looseness of morals. Indeed his reiterated praises of Castara's virtue grow wearisome. He is at his best in his reflective poems on the uncertainty of human life and kindred topics. He also wrote a Historie of Edward the Fourth (1640), based on notes provided by his father; a tragi-comedy, The Queen of Arragon (1640), published without his consent by his kinsman, the earl of Pembroke, and revived at the Restoration; and six essays on events in modern history, Observations upon History (1641). Anthony à Wood insinuated that during the Commonwealth the poet "did run with the times, and was not unknown to Oliver the usurper." He died on the 30th of November 1654.

The works of Habington have not been collected. The Queen of Arragon and the first part of his translation of Shakespeare's "Old Plays," vol. i. (1624) Castara was edited by Charles Elton (1819), and by E. Arber with a compact and comprehensive introduction (1870) for his "English Reprints."

HABIT (through the French from Lat. habitus, from habere, to have, hold, or, in a reflective sense, to be in a certain condition; in many of the English senses the French use habitude, not habit), condition of body or mind, especially one that has become permanent or settled by custom or persistent repetition, hence custom, usage. In botany and zoology the term is used both in the above sense of instinctive action of animals and tendencies of plants, and also of the manner of growth or external appearance of a plant or animal. From the use of the word for external appearances comes its use for fashion in dress, and hence as a term for a lady's riding dress and for the particular form of garment adopted by the members of a religious order, like "cowl" applied as the mark of a monk or nun.

HABITAT (a French word derived from habiter, Lat. habitat, to dwell), in botany and zoology, the term for the locality in which a particular species of plants or animals thrives.

HABSBURG, or Habsburg, the name of the famous family which have sprung the dukes and archdukes of Austria from 1282, kings of Bohemia from 1326, and emperors of Austria from 1804. They were also Roman emperors and German kings from 1438 to 1866, and kings of Spain from 1516 to 1700, while the minor dignities held by them at different times are too numerous to mention.

The name Habsburg, a variant of an older form, Habichtsburg (hawk's castle), was taken from the castle of Habsburg, which was situated on the river Aar not far from its junction with the Rhine. The castle was built about 1020 by Werner, bishop of Strassburg, and his brother Radbot, the founder of the abbey of Muri. Of these magnificent structures, according to some authorities, is identical with a Count Guntram, who flourished during the reign of the emperor Otto the Great, and whose ancestry can be traced back to the time of the Merovingian kings. This conjecture, however, is extremely problematical. Among Radbot's sons was one Werner, and Werner and his son Otto were called counts of Habsburg, Otto being probably made landgrave of upper Alsace late in the 11th or early in the 12th century. At all events Otto's son Werner (d. 1107), and the latter's son Albert (d. 1199), held this dignity, and both landgraves increased the area of the Habsburg lands. Albert became count of Zürich and protector of the monastery of Säckingen, and obtained lands in the cantons of Unterwalden and Lucerne; his son Rudolph, having assisted Frederick of Hohenstaufen, afterwards the emperor Frederick II., against the emperor Otto IV., received the county of Aargau. Both counts largely increased their possessions in the districts now known as Switzerland and Alsace, and Rudolph held an influential place among the Swabian nobility. After his death in 1232 his two sons, Albert and Rudolph, divided his lands and founded the lineages of Habsburg-Hapsburg and Habsburg-Lauenburg. Rudolph's descendants, counts of Habsburg-Lauenburg, were soon divided into two branches, one of which became extinct in 1498 and the other seven years later. Before this date, however, Lauenburg and some other districts had been sold to the senior branch of the family, who thus managed to retain the greater part of the Habsburg lands.

Rudolph's brother Albert (d. 1239), landgrave of Alsace, married Hedwig of Kyburg (d. 1260), and from this union there was born in 1218 Rudolph, the founder of the greatness of the house of Habsburg, and the first of the family to ascend the German throne. Through his mother he inherited a large part of the lands of the extinct family of Zähringen; he added in other ways to his possessions, and was chosen German king in September 1273. Acting vigorously in his new office, he defeated and killed his most formidable adversary, Ottakar II., king of Bohemia, in 1278, and in December 1282 he invested his sons, Albert and Rudolph, with the duties of Austria and Styria, which with other lands had been taken from Ottakar. This was an event of supreme moment in the history of the Habsburgs, and was the first and most important stage in the process of the territorialis the centre of their authority from western to eastern Europe, from the Rhine to the Danube. On Rudolph's death in July 1291 the German crown passed for a time away from the Habsburgs, but in July 1298 it was secured by his son, Albert, whose reign, however, was short and eventful. But before 1308, the year of Albert's death, the long and troubled connexion of the Habsburgs with Bohemia had already begun. In 1306 Wenceslas III., the last Bohemian king of the Přemyslid dynasty, was murdered. Seizing the opportunity and declaring that the vacant kingdom was an imperial fief, King Albert
HABSBURG, HOUSE OF

bestowed it upon his eldest son, Rudolph, and married this prince to Elizabeth, widow of Wenceslas II. and stepmother of Wenceslas III. But Rudolph died in 1307, and his father’s attempt to keep the country in his own hands was ended by his murder in 1308.

Albert’s successor as German king was Henry of Luxembourg (the emperor Henry VII.), and this election may be said to initiate the long rivalry between the houses of Habsburg and Luxembourg. But the immediate enemy of the Habsburgs was not a Luxemburg but a Wittelsbach. Without making any definite partition, Albert’s five remaining sons divided themselves in governing their lands until 1314, when one of them, Frederick called the Fair, forsook this comparatively uneventful occupation and was chosen by a minority of the electors German king in succession to Henry VII. At the same time the Wittelsbach duke of Bavaria, Louis, known to history as the emperor Louis the Bavarian, was also chosen. War was inevitable, and the battle of Mühlendorf, fought in September 1322, sealed the fate of Frederick. Louis was victorious; his rival went into an honourable captivity, and the rising Habsburg sun underwent a temporary eclipse.

For more than a century after Frederick’s death in 1330 the Habsburgs were exiles from the German throne. But they were not inactive. In 1335 his two surviving brothers, Albert and Otto, inherited Carinthia and part of Carniola by right of their mother, Elizabeth; in 1363 Albert’s son Rudolph received Tirol; and during the same century part of Istrià, Trieste and other districts were acquired. All King Albert’s six sons had died without leaving male issue save Otto, whose family became extinct in 1364, and Albert, the ancestor of all the later Habsburgs. Of Albert’s four sons two also left no male heirs, but the remaining two, Albert III. and Leopold III., were responsible for a division of the family which is of some importance. By virtue of a partition made upon their brother Rudolph’s death in 1365 Albert and his descendants ruled over Austria, while Leopold and his sons took Styria, Carinthia and Tirol, Alsace remaining undivided as heretofore.

Towards the middle of the 15th century the German throne had been occupied for nearly a hundred years by members of the Luxemburg family. The reigning emperor Sigismund, who was also king of Hungary and Bohemia, was without sons, and his daughter Elizabeth was the wife of Albert of Habsburg, the grandson and heir of Duke Albert III., who had died in 1305. Sigismund died in December 1437, leaving his two kingdoms to his son-in-law, who was crowned king of Hungary in January 1438 and king of Bohemia in the following June. Albert was also chosen and crowned German king in succession to Sigismund, thus beginning the long and uninterrupted connexion of his family with the imperial throne, a connexion which lasted until the dissolution of the Holy Roman Empire in 1806. He did not, however, enjoy his new dignities for long, as he died in October 1439 while engaged in a struggle with the Turks. Albert left no sons, but soon after his death one was born to him, called Ladislaus, who became duke of Austria and king of Hungary and Bohemia.

Under the guardianship of his kinsman, the emperor Frederick III., the young prince’s reign was a troubled one, and when he died unmarried in 1457 his branch of the family became extinct, and Hungary and Bohemia passed away from the Habsburgs, who managed, however, to retain Austria.

Leopold III., duke of Carinthia and Styria, who was killed in 1386 at the battle of Sempach, had four sons, of whom two only, Frederick and Ernest, left male issue. Frederick and his only son, Sigismund, confined their attention mainly to Tirol and Alsace, leaving the larger destinies of the family in the hands of Ernest of Carinthia and Styria (d. 1424) and his sons, Frederick and Albert and after the death of King Ladislaus in 1457 these two princes and their cousin Sigismund were the only representatives of the Habsburgs. In February 1450 Frederick of Styria was chosen German king in succession to his kinsman Albert. He was a weak and incompetent ruler, but a stronger and able man might have shrunk from the task of administering his heterogeneous and unruly realm. Although very important in the history of the house of Habsburg, Frederick’s long reign was a period of misfortune, and the motto which he assumed, A.E.I.O.U. (Austriae est imperare orbi universo), seemed at the time a particularly foolish boast. He acted as guardian both to Ladislaus of Hungary, Bohemia and Austria, and to Sigismund of Tirol, and in all these countries his difficulties were increased by the hostility of his brother Albert. Having disgusted the Tiroles he gave up the guardianship of their prince in 1446, while in Hungary and Bohemia he did absolutely nothing to establish the authority of his ward; in 1452 the Austrians pacified the Burgundians by the marriage of Sigismund and Neustadt and compelled him to surrender the person of Ladislaus, thus ending even his nominal authority. When the young king died in 1457 the Habsburgs lost Hungary and Bohemia, but they retained Austria, which, after some disputing, Frederick and Albert divided between themselves, the former taking lower and the latter upper Austria. This arrangement was of short duration. In 1461 Albert made war upon his brother and forced him to resign lower Austria, which, however, he recovered after Albert’s death in December 1463.

Still more unfortunate was the German king in Switzerland. For many years the Swiss had chafed under the rule of the Habsburgs; during the reign of Rudolph I. they had shown signs of resentment as the kingly power increased; and the struggle which had been carried on for nearly two centuries had been almost uniformly in their favour. It was marked by the victory of Morgarten over Duke Leopold I. in 1315, and by that of Sempach over Leopold III. in 1386, by the conquest of Aargau at the instigation of the emperor Sigismund early in the 14th century, and by the final struggle for freedom against Frederick III. and Sigismund of Tirol. Taking advantage of some dissensions among the Swiss, the king saw an opportunity to recover his lost lands, and in 1443 war broke out. But his allies, the men of Zürich, were defeated, and when in August 1444 some French mercenaries, who had advanced to his aid, suffered the same fate at St Jakob, he was compelled to give up the struggle. A few years later Sigismund became involved in a war with the same formidable foes; he too was worsted, and the “Perpetual Peace” of 1474 ended the rule of the Habsburgs in Switzerland. This humiliation was the second great step in the process of removing the Habsburgs from western to eastern Europe. In 1453, just after his coronation as emperor at Rome, Frederick legalized the use of the title archduke, which had been claimed spasmodically by the Habsburgs since 1361. This title is now peculiar to the house of Habsburg.

The reverses suffered by the Habsburgs during the reign of Frederick III. were many and serious, but an improvement was at hand. The emperor died in August 1493, and was followed on the imperial throne by his son Maximilian I., perhaps the most versatile and interesting member of the family. Before his father’s death Maximilian had been chosen German king, and king of the Romans, and had begun to repair the fortunes of his house. He had married Mary, daughter and heiress of Charles the Bold, duke of Burgundy; he had driven the Hungarians from Vienna and the Austrian archduchies, which Frederick had, perforce, allowed them to occupy; and he had received Tirol on the abdication of Sigismund in 1490. True it is that upon Mary’s death in 1482 part of her inheritance, the rich and prosperous Netherlands, held that her husband’s authority was at an end, while another part, the two Burgundies and Artois, had been seized by the King of France; nevertheless, after a protracted struggle the German king secured almost the whole of Charles the Bold’s lands for his son, the archduke Philip, the duchy of Burgundy alone remaining in the power of France after the conclusion of the peace of Senlis in 1453. Maximilian completed his work by adding a piece of Bavaria, Görz and then Gradiska to the Habsburg lands.

After Sigismund’s death in 1490 Maximilian and Philip were the only living male members of the family. Philip married Joanna, daughter of Ferdinand and Isabella of Spain, and died in 1506 leaving two sons, Charles and Ferdinand. Charles succeeded his father in the Netherlands; he followed his grandfather, father, Ferdinand, as king of Spain in 1516, and when the other,
Maximilian, died in 1559 he became the emperor Charles V., and succeeded to all the hereditary lands of the Habsburgs. But provision had to be made for Ferdinand, and in 1521 this prince was given the Austrian archduchies, Austria, Styria, Carinthia and Carniola; in the same year he married Anne, daughter of Wladislaus, king of Hungary and Bohemia, and when his childless brother-in-law, King Louis, was killed at the battle of Mohacs in August 1526 he claimed the two kingdoms, both by right of his wife and by treaty. After a little trouble Bohemia passed under his rule, but Hungary was more recalcitrant. A long war took place between Ferdinand and John Zapolya, who was also crowned king of Hungary, but in 1538 a treaty was signed by which the country was divided, the Habsburg prince retaining the western and smaller portion. However, he was soon confronted with a more formidable foe, and he spent a large part of his subsequent life in defending his lands from the attacks of the Turks.

The Habsburgs had now reached the summit of their power. The prestige which belonged to Charles as head of the Holy Roman Empire was backed by the wealth and commerce of the Netherlands and of Spain, and by the riches of the Spanish colonies in America. In Italy he ruled over Sardinia, Naples and Sicily, which had passed to him with Spain, and also the crown of Milan, which he had annexed in 1535; to the Netherlands he had added Friesland, the bishopric of Utrecht, Gröningen and Gelderland, and he still possessed Franche-Comté and the fragments of the Habsburg lands in Alsace and the neighbourhood. Add to this Ferdinand's inheritance, the Austrian archduchies and Tirol, Bohemia with her dependent provinces, and a strip of Hungary, and the two brothers had under their sway a part of Europe the extent of which was great, but the wealth and importance of which were immeasurably greater. Able to scorn the rivalry of the other princely houses of Germany, the Habsburgs saw in the kings of the house of Valois the only foes worthy of their regard.

When Charles V. abdicated he was succeeded as emperor, not by his son Philip, but by his brother Ferdinand. Philip became king of Spain, ruling also the Netherlands, Franche-Comté, Naples, Sicily, Milan and Sardinia, and the family was definitely divided into the Spanish and Austrian branches. For Spain and the Spanish Habsburgs the 17th century was a period of loss and decay, the seeds of which were sown during the reign of Philip II. The new monarchs of the house of Austria were Maximilian I., his brother, and Ferdinand II., his son, and in 1609 and definitely by the treaty of Westphalia in 1648; Roussillon and Artois were annexed to France by the treaty of the Pyrenees in 1659, while Franche-Comté and a number of towns in the Spanish Netherlands suffered a similar fate by the treaty of Nijmegen in 1678. Finally Charles II., the last Habsburg king of Spain, died childless in November 1700, and his lands were the prize of the War of the Spanish Succession. The Austrian Habsburgs fought long and valiantly for the kingdom of their kinsman, but Louis XIV. was too strong for them, and by the peace of Rastatt Spain passed from the Habsburgs to the Bourbons. However, the Austrian branch of the family received in 1714 the Italian possessions of Charles II., except Sicily, which was given to the duke of Savoy, and also the southern Netherlands, which are thus often referred to as the Austrian Netherlands; and retained the duchy of Mantua, which it had seized in 1708.

Ferdinand I., the founder of the line of the Austrian Habsburgs, arranged a division of his lands among his three sons before his death in 1564. The eldest, Maximilian II., received Austria, Bohemia and Hungary, and succeeded his father as emperor; he married Maria, a daughter of Charles V., and though he had a large family his male line became extinct in 1619. The younger sons were Ferdinand, ruler of Tirol, and Charles, archduke of Styria. The emperor Maximilian II. left five sons, two of whom, Rudolph and Matthias, succeeded in turn to the imperial throne, but, as all the brothers were without male issue, the family was early in the 17th century threatened with a serious crisis. Rudolph died in 1612, the reigning emperor Matthias was old and ill, and the question of the succession to the Empire, to the kingdoms of Hungary and Bohemia, and to the hereditary lands of the Habsburgs became acute. Turning to the collateral branches of the family, the sons of the archduke Ferdinand were debarred from the succession owing to their father's morganatic marriage with Philippine Welser, and the only hope of the house was in the sons of Charles of Styria. To prevent the Habsburg monarchy from falling to pieces the emperor's two surviving brothers renounced their rights, and it was decided that Ferdinand, a son of Charles of Styria, should succeed his cousin Matthias. The difficulties which impeded the completion of this scheme were gradually overcome, and the result was that when Matthias died in 1619 the whole of the house of Austria and the Habsburgs was united under the rule of the emperor Ferdinand II. Thus, in 1622, the line which later was separated from the rest of the monarchy and given to the emperor's brother, the archduke Leopold, but this separation was ended when Leopold's son died in 1665.

The arbitrary measures which followed Ferdinand's acquisition of the Bohemian crown contributed to the outbreak of the Thirty Years' War, but in a short time the Bohemians were subdued, and in 1627, following a precedent set in 1547, the emperor declared the throne hereditary in the house of Habsburg. The line of the younger brothers of Ferdinand II., the Habsburgs in Spain, were practically separated, the house of Bourbon having been given to Spain; and Ferdinand III., who was the younger brother of Ferdinand II., was given in 1649 the crown of Portugal. In 1659 the Habsburgs and Bourbons decided to make the two dominions a single empire, but the Spanish Habsburgs were weakened by the loss of most of their possessions in America, and they were no more than a province of the Bourbon throne.

In 1699 the Habsburgs had their last great victory, the battle of Lützen, which was followed by the Peace of Rastatt. The Peace of Nimwegen, in 1678, added Friesland and Artois to France, and the Spanish Netherlands came into the hands of Philip V. of Bourbon. The War of the Spanish Succession, in 1717, added the crown of Sardinia to the Bourbon throne, and the kingdom of Tuscany passed to the house of Bourbon.

The Habsburgs, having thus lost their last possessions in Spain, had to content themselves with the Austrian empire, which was now the largest of any European state. The empire consisted of the Holy Roman Empire, the Austrian monarchy, and the Netherlands, with a number of other provinces, including Bohemia, Hungary, and Transylvania. The empire was ruled by a dynasty of Habsburgs, who were descended from the house of Habsburg, which had been established in Austria in the 13th century.

The Habsburgs were a powerful and influential family, and they played an important role in European politics. They were able to maintain their power and influence for many centuries, but they were eventually overthrown by the Bourbons, who gained control of the Spanish throne in 1714. The Habsburgs were succeeded by the House of Austria, which continued to reign in Austria until 1918.

In summary, the Habsburgs were a powerful and influential family who played an important role in European politics. They were able to maintain their power and influence for many centuries, but they were eventually overthrown by the Bourbons in 1714. The Habsburgs were succeeded by the House of Austria, which continued to reign in Austria until 1918.
Maria Theresa and Francis Stephen; and it is interesting to note that the present Habsburgs are only descended in the female line from Rudolph I. and Maximilian I.

Immediately after the death of Charles the Pragmatic Sanction was forgotten. A crowd of claimants called for various parts of the Habsburg lands; Frederick the Great, talking less but acting more, invaded and conquered Silesia, and it seemed likely that the dissolution of the Habsburg monarchy would at no long interval follow the extinction of the Habsburg race. A Wittelsbach prince, Charles Albert, elector of Bavaria, the emperor Charles VII., and not Francis Stephen, was chosen emperor in January, 1742, and by the treaty of Breslau made later that same year, nearly all Silesia was formally surrendered to Prussia. But the worst was now over, and when in 1748 the peace of Aix-la-Chapelle, which practically confirmed the treaty of Breslau, had cleared away the dust of war, Maria Theresa and her consort were found to occupy a strong position in Europe. In the first place, in September 1745, Francis had been chosen emperor; then the imperial pair ruled Hungary and Bohemia, although the latter kingdom was sown of Silesia; in spite of French conquests the Austrian Netherlands remained in their hands; in 1746 the Habsburgs had gained Hungary and Silesia with its ancient heritage, although Parma and Piacenza had been surrendered to Spain and part of Milan to the king of Sardinia. The diplomatic volte-face and the futile attempts of Maria Theresa to recover Silesia which followed this treaty belong to the general history of Europe.

The emperor Francis I. died in 1765 and was succeeded by his son Joseph II., an ambitious and able prince, whose aim was to restore the Habsburgs and the Empire to their former great positions in Europe, and whose pride did not prevent him from learning from Frederick the Great, the despoiler of his house. His projects, however, including one of uniting Bavaria with Austria, which was especially cherished, failed completely, and when he died in February 1790 he left his lands in a state of turbulence which reflected the general condition of Europe. The Netherlands had risen against the Austrians, and in January 1790 had declared themselves independent; Hungary, angered by Joseph's despotical measures, was in revolt, and the other parts of the monarchy were hardly more contented. But the 18th century saw a few successes for the Habsburgs. In 1778 a successful war with Turkey was ended by the peace of Passarowitz, which advanced the Austrian boundary very considerably to the east, and although by the treaty of Belgrade, signed twenty-one years later a large part of this territory was surrendered, yet a residuum, the banate of Temeswar, was permanently incorporated with Hungary. The struggle over the succession to Bavaria, which was concluded in 1779 by the treaty of Teschen, was responsible for adding Innviertel, or the quarter of the Inn, to Austria; the first partition of Poland brought eastern Galicia and Lodomeria, and in 1777 the sultan ceded Bukovina. Joseph II. was followed by his brother, Leopold II., who restored the Austrian authority in the Netherlands, and the latter by his son Francis II., who resigned the crown of the Holy Roman Empire in August 1806, having two years before taken the title of emperor of Austria as Francis I.

Before the abdication of the emperor Francis in 1806 Austria had met and suffered from the fury of revolutionary France, but the cessions of territory made by her at the treaties of Campo Formio (1797), of Lunéville (1801) and of Pressburg (1805) were of no enduring importance. This, however, cannot be said for the treaties of Paris and of Vienna, which in 1814 and 1815 arranged the map of Europe upon the conclusion of the Napoleonic wars. These were highly favourable to the Habsburgs. In eastern and central Europe Austria regained her former position, the lands ceded to Bavaria and also eastern Galicia, which had been in the hands of Russia since 1809, being restored; she gave up the Austrian Netherlands, soon to be known as Belgium, to the new kingdom of the Netherlands, and acquiesced in the arrangement which had taken from her the Breisgau and the remnant of the Habsburg lands upon the Rhine. In return for these losses Austria became the dominant power in Italy. A mass of northern Italy, including her former possessions in Milan and the neighbourhood, and also the lands recently forming the republic of Venice, was made into the kingdom of Lombardy-Venetia, and this owned the emperor of Austria as king. Across the Adriatic Dalmatia was added to the Habsburg monarchy, the population of which, it has been estimated, was increased at this time by over four millions.

The illiberal and oppressive character of the Austrian rule in Italy made it very unpopular; it was hardly less so in Hungary and Bohemia, and the advent of the year 1848 found the subject kingdoms eager to throw off the Habsburg yoke. The whole empire was torn by internal disturbances in a state of revolution, in the midst of which the emperor Ferdinand, who had succeeded his father Francis in 1835, abdicated, and his place was taken by his young nephew Francis Joseph. The position of the Habsburg monarchy now seemed desperate. But it was strong in its immemorial tradition, which was enough to make the efforts of the Frankfort parliament to establish German unity under Prussian hegemony abortive; it was strong also in the general loyalty to the throne of the imperial army; and its counsels were directed by statesmen who knew well how to exploit in the interests of the central power the national rivalries within the monarchy. With the crushing of the Hungarian revolt by the emperor Nicholas I. of Russia in 1849 the monarchy was freed from the most formidable of its internal troubles; in 1850 the convention of Olmütz restored its influence in Germany.

Though the status quo was thus outwardly re-established, the revolutions of 1848 had really unchained forces which made its maintenance impossible. In Germany Prussia was steadily preparing for the inevitable struggle with Austria for the mastery; in France Napoleon III. was preparing to pose as the champion of the oppressed nationalities which had once more settled down under the Habsburg yoke. The alliance of the French emperor and the king of Sardinia, and the Italian war of 1859 ended in the loss of Lombardy to the Habsburgs. Seven years later the crushing defeat of Königgrätz not only ended their long rule in Italy, based on the tradition of the medieval empire, by leading to the cession of Venetia to the new Italian kingdom, but led to their final exclusion from the German confederation, soon to become, under the headship of Prussia, the German empire.

By the loss of the predominance in Germany conceded to it by the treaties of Vienna, and by the shifting of its "centre of gravity" eastward, the Habsburg monarchy, however, perhaps gained more than it lost. One necessary result, indeed, was the composition (Ausgleich) with Hungary in 1867, by which the latter became an independent state (Francis Joseph being crowned king at Pest in June 1867) bound to the rest of the monarchy only by the machinery necessary for the carrying out of a common policy in matters of common interest. This at least restored the loyalty of the Hungarians to the Habsburg dynasty; it is too soon yet to say that it secured permanently the essential unity of the Habsburg monarchy. By the system of the Dual Monarchy the rest of the Austrian emperor's dominions (Cis-Leithen) were consolidated under a single central government, the history of which has been mainly that of the rival races within the empire struggling for political predominance. Since the development of the constitution has been consistently in a democratic direction and the Slavs are in a great majority, the tendency has been for the German element—strong in its social status and tradition of predominance—to be swamped by what it regards as an inferior race; and a considerable number of Austrian "Germans" have learned to look not to their Habsburg rulers, but to the power of the German empire for political salvation. The tendency eastwards of the monarchy was increased when in 1878 the congress of Berlin placed Bosnia and Herzegovina under Austrian rule. Old ambitions were now revived at the expense of the Ottoman empire, the goal of which was the port of Salonica; and not the least menacing aspect of the question of the near East has been that the rivalry of Italy and the Habsburg monarchy has been transferred to the Balkan peninsula. Yet, in spite of internal
discussions arising out of questions fundamentally insoluble, and in face of the constant threat of external complications that may lead to war, the Habsburg monarchy as the result of the changes in the 19th and 20th centuries is seemingly stronger than ever. The shadow of universal claims to empire and sonorous but empty titles have vanished, but so have the manifold rivalries and entanglements which accompanied the Habsburg rule in Italy and the Netherlands and Habsburg preponderance in Germany. The monarchy is stronger because its sphere is more defined; because as preserving the pax Romana among the jostling races of eastern Europe, it is more than ever recognized as an essential element in the maintenance of European peace, and is recognized as necessary and beneficial even by the ambitious and restless nationalities that chafe under its rule. A few words must be said about the cadet branches of the Habsburg family. When, in 1765, Francis I. died and Joseph II. became emperor, the grand-duchy of Tuscany passed by special arrangement not to Joseph, but to his younger brother Leopold. Then in 1791, after Leopold had succeeded Joseph as emperor, he handed over the grand-duchy to his second son, Ferdinand (1769-1824). In 1801 this prince was deposed by Napoleon and Tuscany was seized by France. Restored to the Habsburgs in the person of Ferdinand in 1814, it remained under his rule, and then under that of his son Leopold (1797-1870), until the rising of 1859, when the Austrians were driven out and the grand-duchy was added to the kingdom of Sardinia. A similar fate attended the duchy of Modena, which had passed to the Habsburgs through the marriage of its heiress Mary Beatrice of Este (d. 1829) with the archduke Ferdinand (1754-1806), brother of the emperor Leopold II. From 1814 to 1846 this duchy was governed by Ferdinand's son, Duke Francis IV., and from 1846 to 1859 by his grandson, Francis V. This family became extinct on the death of Francis V. in 1875.

In addition to his successor Francis II., and to Ferdinand, grand-duke of Tuscany, the emperor Leopold II. had eight sons, five of whom, including the archduke John (1782-1859), who saw a good deal of service during the Napoleonic Wars and was chosen regent (Reichsverweser) of Germany in 1848, have now no living male descendants. Thus the existing branches of the family are descended from Leopold's five other sons. The descendants of Leopold, the dispossessed grand-duke of Tuscany, were in 1900 represented by his son, Ferdinand (b. 1835), who still claimed the title of grand-duke of Tuscany, and his son and grandsons; by the numerous descendants of the archduke Charles Salvador (1839-1892); and by the archduke Louis Salvador (b. 1847), a great traveller and a voluminous writer. The grand-duke's fourth son was the archduke John Nepomuck Salvador, who, after serving in the Austrian army, resigned all his rights and titles and under the name of Johann Orth took command of a sailing vessel. He is supposed to have been drowned off the coast of South America in 1891, but reports of his continued existence were circulated from time to time after that date. Of the emperor Leopold's other sons the archduke Charles, perhaps the most distinguished soldier of the family, left four sons, including Albert, duke of Teschen (1817-1893), who inherited some of his father's military ability. Charles's family was in 1900 represented by his grandson, the sons of the archduke Charles Ferdinand (1818-1874). The archduke Joseph (1776-1847), palatine of Hungary, was represented by a grandson, Joseph Augustus (b. 1872), and the archduke Rainer (1783-1853), viceroys of Lombardy-Venetia, by a son Rainer (b. 1827), and by several grandchildren.

The eldest and reigning branch of the family was in 1900 represented by the reigning Francis Joseph, whose father was the archduke Francis Charles (1802-1878), and whose grandfather was the emperor Francis II. Francis Joseph's only son Rudolph died in 1889; consequently the heir to the Habsburg monarchy was the emperor's nephew Francis Charles (b. 1863), the eldest of the three sons of his brother Charles Louis (1833-1896). In 1875 Francis Ferdinand married a wealthy Swiss, Countess of Chotek, renouncing for his sons the succession to the crown. Thus after Francis Ferdinand this would pass to the sons of his brother, the archduke Otto (1865-1906). One of the emperor's three brothers was Maximilian, emperor of Mexico from 1863 to 1867.

With the exception of Charles V. the Habsburgs have produced no statesmen of great ability, while several members of the family have displayed marked traits of insanity. Nevertheless they secured, and for over 350 years they kept, the first place among the potentates of Europe; a dignity in origin and theory elective by nomination in practice hereditary in their house. This position they owe to some extent to the tenacity with which they have clung to the various lands and dignities which have passed into their possession, but they owe it much more to a series of fortunate marriages and opportune deaths. The union of Maximilian and Mary of Burgundy, of Philip the Handsome and Joanna of Spain, of Ferdinand and Anna of Hungary and Bohemia; the death of Ottakar of Bohemia, of John, the only son of Ferdinand and Isabella of Spain, of Louis of Hungary and Bohemia—these are the corner-stones upon which the Habsburg monarchy has been built.

For the origin and early history of the Habsburgs see G. de Roo, Annales rerum ab Austriaciis Habsburgicae gentis principibus a Rudolpho I. usque ad Carolum V. gestarum (Innsbruck, 1592, fol.); M. Kergorvet, Geschichte des Hauses Habsburg (Vienna, 1737-1738); E. M. Fürst von Lichnowsky, Geschichte des Hauses Habsburg (Vienna, 1835-1844); A. Schulte, Geschichte der Habsburger in den ersten drei Jahrhunderten (Innsbruck, 1887); T. H. L. Colquhoun, The Hapsburgs (London, 1888); W. Merz, Die Habsburgs (Aarau, 1896); W. Gisi, Der Ursprung der Häuser Zähringern und Habsburg (1888); and F. Wehrich, Stammbaum der Geschichte des Hauses Habsburg (Vienna, 1893). For the history of the Habsburg monarchy see Läng, Die Habsburg und die deutschsprachigen Stützen ihrer Umgebung (Vienna, 1895); and E. A. Freeman, Historical Geography of Europe (1891). Two English books on the subject are J. Gilbert-Smith, The Cradle of the Hapsburgs (1907); and A. R. and E. Colquhoun, The Whirlpool of Europe, Austria-Hungary and the Hapsburgs (1906).

HACHETTE, JEAN NICOLAS PIERRE (1769-1834), French mathematician, was born at Mézières, where his father was a bookseller, on the 6th of May 1769. For his early education he proceeded first to the college of Charleville, and afterwards to that of Reims. In 1788 he returned to Mézières, where he was attached to the school of engineering as draughtsman to the professors of physics and chemistry. In 1793 he became professor of hydrography at Collioure and Port-Vendre. While there he sent several papers, in which some questions of navigation were treated geometrically, to Gaspar Monge, at that time minister of marine, through whose influence he obtained an appointment in Paris. Towards the close of 1794, when the École Polytechnique was established, he was appointed along with Monge over the department of descriptive geometry. There he instructed some of the ablest Frenchmen of the day, among them S. D. Poisson, F. Arago and A. Fresnel. Accompanying Guyton de Morveau in his expedition, earlier in the year, he was present at the battle of Fleurus, and entered Brussels with the French army. In 1806, on the accession of Louis XVIII., he was expelled from his chair by government. He retained, however, till his death the office of professor in the faculty of sciences in the École Normale, to which he had been appointed in 1810. The necessary royal assent was in 1823 refused to the election of Hachette to the Académie des Sciences, and it was not till 1831, after the Revolution, that he obtained that honour. He died at Paris on the 16th of January 1834. Hachette was held in high esteem for his private worth, as well as for his scientific attainments and great public services. His labours were chiefly in the field of descriptive geometry, with its application to the arts and mechanical engineering. It was left to him to develop the geometry of Monge, and to him also is due in a great measure the rapid advancement which France made soon after the establishment of the École Polytechnique in the construction of machinery.

Hachette's principal works are his Deux Suppléments à la Géométrie descriptive de Monge (1811 and 1818); Éléments de géométrie à trois dimensions (1817); Collection des épreuves de géométrie, &c.
HACETTE, JEANNE—HACKETT, H. B.

(1795 and 1827). *Applications de géométrie descriptive* (1817); *Traité de géométrie descriptive, 3e* (1822); *Traité élémentaire des machines* (1811); *Correspondance sur l'École Polytechnique* (1804—1815). He also contributed many valuable papers to the leading scientific journals of his time.

For further writings see the *Catalogue of Scientific Papers of the Royal Society of London*; also F. Arago, *Oeuvres* (1853); and Silvestre, *Notice sur J. N. P. Hachette* (Brussels, 1836).

HACHETTE, JEANNE, French heroine. Jeanne Lainé, or Fourquet, called Jeanne Hachette, was born about 1454. We have no precise information about her family or origin. She is known solely for her act of heroism which on the 27th of June 1472 saved Beauvais when it was on the point of being taken by the troops of Charles the Bold, duke of Burgundy. The town was defended by only 300 men-at-arms, commanded by Louis de Balagny. The Burgundians were making an assault, and one of their number had actually planted a flag upon the battlements, when Jeanne, axe in hand, flung herself upon him, hurled him into the moat, tore down the flag, and revived the drooping courage of the garrison. In gratitude for this heroic deed, Louis XI. instituted a procession in Beauvais called the Procession of the Assault, and married Jeanne to her chosen lover Colin Filon, loading them with favours.

HACHÈTE, LACOSTE CHRISTOPHE FRANÇOIS (1800—1864). An engineer of Talbert, was born at Rethel in the Ardennes on the 5th of May 1800. After studying three years at a normal school with the view of becoming a teacher, he was in 1822 on political grounds expelled from the seminary. He then studied law, but in 1836 he established in Paris a publishing business for the issue of works adapted to improve the system of school instruction, or to promote the general culture of the community. He published manuals in various departments of knowledge, dictionaries of modern and ancient languages, educational journals, and French, Latin and Greek classics annotated with great care; he also wrote books and articles on the most eminent authorities. Subsequently to 1850 he, in conjunction with other partners, published a cheap railway library, scientific and miscellaneous libraries, an illustrated library for the young, libraries of ancient literature, of modern foreign literature, and of modern foreign romance, a series of guide-books and a series of dictionaries of universal reference.

In 1855 he also founded *Le Journal pour tous*, a publication with a circulation of 150,000 weekly. Hachette also manifested great interest in the formation of mutual friendly societies among the working classes, in the establishment of benevolent institutions, and in other questions relating to the amelioration of the poor, on which subjects he wrote various pamphlets; and he lent the weight of his influence towards a just settlement of the question of international literary copyright. He died on the 31st of July 1864.

HACHURE (French for "hatching"), the term for the conventional lines used in hill or mountain shading upon a map (q.e.), to indicate the slope of the surface, the depth of shading being greatest where the slope is steepest. The method is less accurate than that of contour lines, but gives an indication of the trend and extent of a range or mountain system, especially upon small-scale maps.

HACIENDA (O. Span. *fazenda*, from the Latin, meaning "things to be done"), a Spanish term for a landed estate. It is commonly applied in Spanish America to a country estate, on which stock-raising, manufacturing or mining may be carried on, usually with a dwelling-house for the owner's residence upon it. It is thus used loosely for a country house.

HACKBERRY, a name given to the fruit of Celtis occidentalis, belonging to the natural botanical order Ulmaceae, to which also belongs the elm (*Ulmus*). It is also known under the name of "sugar-berry," "beaver-wood" and "nett-tree." The hackberry tree is of middle size, attaining from 60 to 80 ft. in height (though sometimes reaching 130 ft.), and with the aspect of an elm. The leaves are ovate in shape, with a very long taper point, rounded and usually very oblique at the base, usually glabrous above and soft-pubescent beneath. The soft silky flowers appear early in the spring before the expansion of the leaves. The fruit is oblong, about half to three-quarters of an inch long, of a reddish or yellowish colour when young, turning to a dark purple in autumn. This tree is distributed through the deep sandy forests bordering river banks from Canada (where it is very rare) to the southern states. The fruit has a sweetish and slightly astringent taste, and is largely eaten in the United States. The seeds contain an oil like that of almonds. The bark is tough and fibrous like hemp, and the wood is heavy, soft, fragile and coarse-grained, and is used for making fences and furniture. The root has been used as a dye for linens.

HACKENSACK, a town and the county-seat of Bergen county, New Jersey, U.S.A., on the Hackensack river, 13 m. N. of Jersey City. Pop. (1890), 6004; (1900), 6443, of whom 7000 were foreign born; were 3037 (1795) 14,025; are served by the New York, Susquehanna & Western, and the New Jersey & New York railways, both being controlled by the Erie Company; and indirectly by the West Shore (at Bogota, 3 m. S.E.). Electric lines connect Hackensack with Newark, Passaic and Paterson, and with New York ferries. The town extends from the low bank of the river W. to the top of a ridge, about 40 ft. higher up, from which there are good views to the S. and E.

Hackensack is principally a residential town, though there are a number of manufacturing establishments in and near it. Silk (in 1890, 10,781), which was formerly the chief product, was largely given up after the Hackensack Indians, a division of the Unami Delawares, who lived in the valleys of the Hackensack and Passaic rivers, and whose best-known chief was Ortygik, a friend of the whites. Hackensack is coextensive with the township of New Barbadoes, first incorporated with considerably larger territory in 1603.

HACKETT, JOHN (1592—1670), bishop of Lichfield and Coventry, was born in London and educated at Westminster and Trinity College, Cambridge. On taking his degree he was elected a fellow of his college, and soon afterwards wrote the comedy of *Love in London*, 1668, which was performed before the prince.

He was ordained in 1618, and through the influence of John Williams (1582—1650) became rector in 1621 of Stoke Hammond, Bucks, and Kirby Underwood, Lincolnshire. In 1623 he was chaplain to James, and in 1624 Williams presented him to the livings of St Andrew's, Holborn, and Cheam, Surrey. When the so-called "root-and-branch bill" was before parliament in 1641, Hackett was selected to plead in the House of Commons for the continuance of cathedral establishments. In 1645 his living of St Andrew's was sequestered, but he was allowed to retain the rectory of Cheam. On the accession of Charles II his fortunes improved; he frequently preached before the king, and in 1661 was consecrated bishop of Lichfield and Coventry. His best-known book is the excellent biography of his patron, Archbishop Williams, entitled *Scripta reserata: a Memorial offer'd to the great Deservings of John Williams, D.D.* (London, 1693).

HACKETT, HORATIO BALCH (1808—1873), American biblical scholar, was born in Salisbury, Massachusetts, on the 27th of December 1808. He was educated at Phillips-Andover Academy, at Amherst College, where he graduated as valedictorian in 1830, and at Andover Theological Seminary, where he graduated in 1834. He was adjunct professor of Latin and Greek Languages and Literature at Brown University in 1835—1838 and professor of Hebrew Literature there in 1838—1839, was ordained to the Baptist ministry in 1839—he had become a Baptist at Andover as the result of preparing a paper on baptism in the New Testament and the Fathers—and in 1839—1868 he was professor of...
Biblical literature and interpretation in Newton Theological Institution where his most important work was the introduction of the modern German methods of Biblical criticism, which he had learned from M. Stuart and others with which he made himself more familiar in Germany (especially under Tholuck at Halle) in 1841. He travelled in Egypt and Palestine in 1852, and in 1858–1859 in Greece, becoming proficient in modern Greek. From 1870 until his death in Rochester, New York, on the 2nd of November 1875, he was professor of Biblical literature and New Testament exegesis in the Rochester Theological Seminary. He was a great teacher but a greater critical and exegetical scholar.

He wrote Christian Memorial of the War (1864); an English version of Winer's Grammar of the Chaldee Language (1844); Exercises in Hebrew Grammar (1847); and various articles on the Semitic language and literature in periodicals; but his best-known work was in general commentary on the Bible and translation, and in the special text study of the New Testament. Under these two headings fall: Illustrations of Scripture; suggested by a Tour through the Holy Land (1853); the American revision, with Ezra Abbot, of Smith's Dictionary of the Bible, to the British edition of which he had contributed about thirty articles; Commentary on the Original Text of the Acts of the Apostles (1852, 2nd edition, 1858), for many years the best English commentary; Notes on the Greek Text of the Epistle to the Hebrews, prepared for the American Text Society, published in 1860; the English versions, in Schaff's edition of Lange's Commentaries, of Van Oosterzee's Philothenon and Braune's Philippians; and the Anglo-American translation, the Bible he translated the books of Ruth and Judges, and aided T. J. Conant in editorial revision; and he was one of the American translators for the English Bible revision.

See Memoirs of Horatio Balch Hackett (Rochester, N.Y., 1876), edited by G. H. Whitemore.

HACKETT, JAMES HENRY (1800–1871), American actor, was born in New York. After an unsuccessful entry into business, in 1826 he went on the stage, where he soon established a reputation as a player of eccentric character parts. As Falstaff he was no less successful in England than in America. At various times he went into management, and he was the author of Notes and Comments on Shakespeare (1863).

His son, JAMES KETELTAS HACKETT (1869–1956), born at Wolfe Island, Ontario, and educated at the College of the City of New York, also became an actor. He came into prominence at the Lyceum in Daniel Frohman's company, and afterwards had considerable success in romantic parts. As a manager he stood outside the American syndicate of theatres, and organized several companies to play throughout the United States. In 1897 he married Mary Manning, the Anglo-American actress.

HACKLÄNDER, FRIEDRICH WILHELM VON (1816–1877), German novelist and dramatist, was born at Burtscheid near Aix-la-Chapelle on the 1st of November 1816. Having served an apprenticeship in a commercial house, he entered the state service but, disappointed at not finding advancement, returned to business. A soldier's life had a fascination for him, and he made his debut as an author with Bilder aus dem Soldatenleben im Frieden (1841). After a journey to the east, he was appointed secretary to the crown prince of Württemberg, whom he accompanied on his travels. Wachtstubenabenteuer, a continuation of his first work, appeared in 1845, and it was followed by Bilder aus dem Soldatenleben im Kriege (1849–1850). As a result of a tour in Spain in 1854, appeared Ein Winter in Spanien (1855). In 1859 he published a collection of his earlier works, Unter Land und Meer. In 1859 Hackländer was appointed director of royal parks and public gardens at Stuttgart, and in this post did much towards the embellishment of the city. In 1859 he was attached to the headquarters staff of the Austrian army during the Italian war; in 1861 he was raised to an hereditary knighthood in Austria; in 1864 he retired into private life, and died on the 6th of July 1877. Hackländer's literary talent is confined within narrow limits. There is much in his works of lively, adventurous and even romantic description, but the character-drawing is feeble and superficial.

Hackländer was a voluminous writer: the most complete edition of his works is the third, published at Stuttgart in 1876, in 60 volumes. There is also a good selection in 20 volumes (1881). Among his novels, Namenlose Geschichten (1851); Eugen Stillfried (1852); Krieg und Frieden (1859), and the comedies Der geheime Agent (1850) and Magnetische Kuren (1851) may be specially mentioned. His autobiography appeared in 1878 under the title, Der Roman meines Lebens (Potsdam).

HACKNEY, a north-eastern metropolitan borough of London, England, bounded W. by Stoke Newington and Islington, and S. by Shoreditch, Bethnal Green and Poplar, and extending N. and E. to the boundary of the county of London. Pop. (1901), 219,272. It is a poor and populous district, in which the main thoroughfares are Kingsland Road, continued N. as Stoke Newington Road and Stamford Hill; Mare Street, continued as Clapton High Street to join Stamford Hill; and Lea Bridge Road running N.E. towards Walthamstow and Low Leyton. The borough includes the districts of Clapton in the north, Homerton in the east, and Dalston and in part Kingsland in the west. On the east lies the open flat valley of the Lea, which flows in several branches, and is bordered, immediately outside the confines of the borough, by the extensive reservoirs of the East London water-works. In these low lands lie the Hackney Marshes (338 acres; among several so-called marshes in the Lea valley), and the borough also contains a part of Victoria Park. Collectively, they are called the Hackney Commons, including Mill Fields, Hackney Downs, London Fields, &c. The total area of open spaces exceeds 500 acres. The tower of the ancient parish church of St Augustine, with the chapel of the Rowe family, still stands, and is the only historic building of importance. Among institutions are the German hospital, Dalston, Metropolitan hospital, Kingsland Road, and Eastern Fever hospital, Homerton; and the Hackney polytechnic institute, with which is incorporated the Sir John Cass institute.

Case (1666–1718), a merchant of the London wool trade, became mayor of the city of London, also a member of parliament and sheriff, bequeathed £1000 for the foundation of a free school; in 1732 the bequest was increased in accordance with an unfinished codicil to his will; and the income provided from it is now about £6000, some 250 boys and girls being educated. The parliamentary borough of Hackney comprises north, central and south divisions, each returning one member; and the northern division includes the metropolitan borough of Stoke Newington. The metropolitan borough of Hackney includes part of the Hornsey parliamentary division of Middlesex. The borough council consists of a mayor, 10 aldermen and 60 councillors. Area, 3,889 acres.

In the 13th century the name appears as Hackeneye or Hackeney, but no certain derivation is advanced. Roman and other remains have been found in Hackney Marshes. In 1290 the bishop of London was lord of the manor, which was still held until 1590, when it was granted to Thomas, Lord Wentworth. In 1697 it came into the hands of the Tyssen family. Extensive property in the parish also belonged to the priory of the Knights Hospitallers of St John of Jerusalem at Clerkenwell. From the 16th to the early 19th century there were many fine residences in Hackney. The neighbourhood of Hackney had at one time an evil reputation as the haunt of highwaymen.

HACKNEY (from Fr. haquene, Lat. equus, an ambling horse or mare, especially for ladies to ride; the English "hack" is simply an abbreviation), originally a riding-horse. At the present day, however, the hackney (as opposed to a thoroughbred) is bred for driving as well as riding (see Horse: Breeds). From the hiring-out of hackneys, the word came to be associated with employment for hire (so "a hack," as a general term for a drudge"), especially in combination, e.g. hackney-chair, hackney-coach, hackney-boat. The hackney-coach, a coach with four wheels and two horses, was a form of hired public conveyance (see Carriage).

HADAD, the name of a Syrian deity, is met with in the Old Testament as the name of several human persons; it also occurs in compound forms like Benhadad and Hadadezer. The divinity primarily denoted by it is the storm-god who was known also as Ramman, Bir and Dadda. The Syrian kings of Damascus seem to have habitually assumed the title of Benhadad, or son of Hadad (three of this name are mentioned in Scripture), just as a series of Egyptian monarchs are known to have been...
acustomed to call themselves sons of Amon-Ra. The word Hadadrimmon, for which the inferior reading Hadarrimmon is found in some MSS. in the phrase "the mourning of (or at) Hadadrimmon" (Zech. xii. 11), has been a subject of much discussion. According to Jerome and all the other Christian interpreters, the mourning for something that occurred at a place called Hadadrimmon (Maximianopolis) in the valley of Megiddo is meant, the event alluded to being generally held to be the death of Josiah (or, as in the Targum, the death of Ahaz at the hands of Hadadrimmon); but more recently the opinion has been gaining ground (that Hadadrimmon is occurring in the name of a place, Adon (1 Chron. i. 28) or Tammuz, the allusion being to the mourning by which the Adonis festivals were usually accompanied (Hitzig on Zech. xii. 11, Isa. xvii. 8; Movers, Phönizier, i. 196)). T. K. Cheyne (Encycl. Bibl. s.v.) points out that the Septuagint reads simply Rimmon, and argues that this may be a corruption of Migdon (Megiddo), in itself a corruption of Tammuz-Adon. He would render the verse, "In that day there shall be a great mourning in Jerusalem, as the mourning of the women who weep for Tammuz-Adon" (Adon means lord).

Haddington, Earl of, a Scottish title bestowed in 1627 upon Thomas Hamilton, earl of Melrose (1653-1657). Thomas, who was a member of the great family of Hamilton, being a son of Thomas Hamilton of Priestfield, was a lawyer who became a lord of session as Lord Drumcairn in 1692. He was on very friendly terms with James VI., his legal talents being useful to the king, and he was one of the eight men who, called the Octavians, were appointed to manage the finances of Scotland in 1596. Having also become king’s advocate in 1596, Hamilton was entrusted with a large share in the government of his country when James went to London in 1603; in 1612 he was appointed secretary of state for Scotland, and in 1613 he was created Lord Binning and Byres. In 1616 he became lord president of the court of session, and three years later was created earl of Melrose, a title which he exchanged in 1627 for that of earl of Haddington.

After the death of James I. the earl resigned his offices of president of the court of session and secretary of state, but he served Charles I. as lord privy seal. He died on the 29th of May 1637. Haddington, who was both scholar and wealthy, left a large and valuable collection of papers, which is now in the Advocates’ library at Edinburgh. James referred familiarly to his friend as Tam o’ the Cowgate, his Edinburgh residence being in this street.

The earl’s eldest son, Thomas, the 2nd earl (1600-1640), was a covenanter and a soldier, being killed by an explosion at Dunse castle on the 30th of August 1640. His sons, Thomas (d. 1645) and John (d. 1666), became respectively the 3rd and 4th earls of Haddington, and John’s grandson Thomas (1679-1733) succeeded his father Charles (c. 1650-1685), as 6th earl in 1685, although he was not the eldest but the second son. This curious circumstance arose from the fact that when Charles married Margaret (d. 1700), the heiress of the earldom of Rothes, it was agreed that the two earldoms should be left separate; thus the eldest son John became earl of Rothes while Thomas became earl of Haddington. Thomas was a supporter of George I. during the rising of 1715, and was a representative peer for Scotland from 1716 to 1734. He died on the 28th of November 1735.

The 6th earl was a writer, but in this direction his elder son, Charles, Lord Binning (1697-1732), is perhaps more celebrated. After fighting by his father’s side at Sheriffmuir in 1715 and serving as member of parliament for St Germans, Binning died at Naples on the 27th of December 1732. His eldest son, Thomas (c. 1720-1794), became the 7th earl in 1735, and the latter’s grandson Thomas (1780-1858) became the 9th earl in 1828. The 9th earl had been a member of parliament from 1802 to 1837, when he was made a peer of the United Kingdom as Baron Melros of Tyningham, a title which became extinct upon his death. In 1834 he became lord-lieutenant of Ireland under Sir Robert Peel, leaving office in the following year, and in Peel’s second administration (1841-1846) he served as first lord of the admiralty and then as lord privy seal. When he died without sons on the 1st of December 1848 the earldom passed to his kinsman, George Bailie (1802-1870), a descendant of the 6th earl. This nobleman took the name of Bailie-Hamilton, and his son George (b. 1827) became 11th earl of Haddington in 1870.

See State Papers of Thomas, Earl of Melrose, published by the Abbotford Club in 1837, and Sir W. Fraser, Memorials of the Earls of Haddington (1880).

Haddington, a royal, municipal and police burgh, and county town of Haddingtonshire, Scotland. Pop. (1901), 3983. It is situated 18 m. E. of Edinburgh by the North British railway, being the terminus of a branch line from Longniddry Junction. Five bridges cross the river, on the right bank of which lies the old and somewhat decayed suburb of Nungate, interesting as having contained the Giffordgate, where John Knox was born, and where also are the ruins of the pre-Reformation chapel of St Martin. The principal building in the town is St Mary’s church, a cruciform Decorated edifice in red sandstone, probably dating from the 13th century. It is 210 ft. long, and is surmounted by a square tower 90 ft. high. The nave, restored in 1843, is used as the parish church, but the choir and transepts are roofless, though otherwise left in repair. In a vault is a fine monument in alabaster, consisting of the recumbent figures of John, Lord Maitland of Thirlestane (1545-1595), chancellor of Scotland, and his wife. The laudatory sonnet composed by James VI. is inscribed on the tomb. In the same vault John, duke of Lauderdale (1616-1682), is buried. In the choir is the tombstone which Carlyle erected over the grave of his wife, Jane Baillie Welsh (1801-1866), a native of the town. Other public edifices include the county buildings in the Tudor style, in front of which stands the monument to George, 8th marquess of Tweeddale (1787-1858), who was such an expert and enthusiastic coachman that he once drove the mail from London to Haddington without taking rest; the corn exchange, next to that of Edinburgh the largest in Scotland; the town house, with a spire 150 ft. high, in front of which is a monument to John Home, the author of Douglas; the district asylum to the north of the burgh; the western district hospital; the Tenterfield home for children; the free library and the Knox Memorial Institute. This last-named building was erected in 1879 to replace the old and famous grammar school, where John Knox, William Dunbar, John Major and possibly George Buchanan and Sir David Lindsay were educated. John Brown (1722-1787), a once celebrated dissenting divine, author of the Self-Interpreting Bible, ministered in the burgh for 36 years and is buried there; his son John the theologian (1754-1832), and his grandson Samuel (1817-1856), the chemist, noted for his inquiries into the atomic theory, were natives. Samuel Smiles (1812-1904), author of Character, Self-Help and other works, was also born there, and Edward Irving was for years mathematical master in the grammar school. In Hardgate Street is “Bothwell Castle,” the town house of the earl of Bothwell, where Mary Queen of Scots rested on her way to Dunbar. The ancient market cross has been restored. The leading industries are the making of agricultural implements, manufactures of woollens and sacking, brewing, tanning and coach-building, besides corn mills and engineering works.

The burgh is the retail centre for a large district, and its grain markets, once the largest in Scotland, are still of considerable importance. Haddington was created a royal burgh by David I. It also received charters from Robert Bruce, Robert II. and James VI. In 1262 it appears as Herberstune or Hardstone, a daughter of William de Warenne, earl of Surrey, on her marriage to Prince Henry, the only son of David I. It was occasionally the residence of royalty, and Alexander II. was born there in 1108. Lying in the direct road of the English invaders, the town was often ravaged. It was burned by King John in 1216 and by Henry III. in 1244. Fortified in 1548 by Lord Grey of Wilton, the English commander, it was besieged next year by the Scots and French, who forced the garrison to withdraw. So much slaughter had gone on during that period of storm and stress that it was long impossible to excavate in any direction without coming
on human remains. The town has suffered much periodically from floods. One of the most memorable of these occurred on the 4th of October 1775, when the Tyne rose 8 ft. 9 in. above its bed and inundated a great part of the burgh. An inscription in the centre of the town records the event and marks the point to which the water rose.

There are many interesting places within a few miles of Haddington. Five miles E is Whittingehame House, and 5 m. N. E. is the thriving village of East Linton (pop. 919). About 24 m. N. lies Athelstaneford (locally, Eshfinlock), so named from the vicinity of Hunsg, king of the Britons, in the 1st century B.C., by whom it was established.

On a hill near Drem, 31 m. N. by W., are traces of a Roman-British settlement, and the remains of the priest's house of the Knights Templars, to whom the church once belonged. On the coast is the pretty village of Aberlady on a fine bay, and in the neighbourhood are some of the finest golf links in Scotland, such as Luffness, Gullane, Archerfield and Muthill. On Gosford Bay is Gosford House, an 18th-century mansion, the seat of the Earl of Stenton, for whom the place is named. At Gladsmuir, 33 m. W. of Haddington, alleged by some to have been the birthplace of George Heriot, Principal Robertson was minister and wrote most of his History of Scotland. Of the old seat of the Douglases at Longniddry a few traces remain, and in the chapel, now in ruins, at the eastern end of the village, John Knox is said to have preached occasionally. At Gifford, 4 m. to the S., John Witherspoon (1722-1794), president of the College of New Jersey (Princeton), and Charles Nisbet (1736-1804), president of Dickinson College, Carlisle, Pennsylvania, were born. A little to the south of Gifford are Yester House, a seat of the marquesses of Tweedside, finely situated in a park of old trees, and Yester Castle, which is probably the goblin Hall is described in Marmion, and is associated with all kinds of manifestations of the black art. Lennoxlove, 13 m. to the S., a seat of the Scotts of Buccleuch, was once the residence of the Sinclairs for some few centuries was associated with the Maitlands. Amisfield, adjoining Haddington on the N.E., is another seat of the earl of Wemyss.

HADDINGTONSHIRE, or East Lothian, a south-eastern county of Scotland, bounded N. by the Firth of Forth, N.E. by the North Sea, E., S. E. and S. by Berwickshire, and S.W. and W. by Edinburghshire. It covers an area of 171,011 acres, or 267 sq. m. Its sea-coast measures 41 m. The Bass Rock and Fidra Isle belong to the shire, and there are numerous rocks and reefs off the shore, especially between Dunbar and Gullane Bay. Broadly speaking, the northern half of the shire slopes gently to the coast, and the southern half is hilly. Several of the peaks of the Lammermuirs exceed 500 ft., and the more level tract is broken by Traprain Law (724) in the parish of Prestonpans, North Berwick Law (612), and Garleton Hill (590) to the north of the county town.

The Firth of Forth is the southern extremity of the Nova Scotiae, the capital, the former lying on the north-western side of the latter, the strike being S.W. to N.E. The granitic mass of Priestlaw and other felsitic rocks have been intruded into these strata. The lower Old Red Sandstone has not been observed in this county, but the younger sandstones and conglomerates fill up ancient depressions in the Silurian and Ordovician, such as that running northward from Oldhamstocks towards Dunbar and the valley of the Tyne. The faulted outcrop of the sandstones and slates is about 1 m. in breadth, runs westward from near Dunbar to Gifford. Carboniferous rocks form the remainder of the county. The calciferous Sandstone series, shales, thin limestones and sandstones, is extensively worked on the east coast, and producesosite, especially between Garleton Hills and Traprain Law; and the latter and North Berwick Law are volcanic rocks or vents. The Carboniferous Limestone series which succeeds the Calciferous Sandstone consists of a middle group of sandstones, shales and ironstones, with a limestone group above and below. The coal-field is synclinal in structure, Port Seton being about the centre; it contains ten seams of coal, and the area covered shallow water in the Christian era, and much the lower ground, and ridges of gravel and sand flanks the hill and form extensive sheets. Traces of old raised sea-beaches are found at several points along the coast. At North Berwick, Tyninghame and the sandstone cliffs below North Berwick are of the strata found at many places, and hematie was formerly obtained from the Garleton Hills.

Climate and Agriculture.—Though the county is exposed to the full sweep of the east wind during March, April and May, the climate is on the whole mild and equable. The rainfall is far below the average of Great Britain, the mean for the year being 25 in., highest in midsummer and lowest in spring. The average temperature for the year is 47° F., for January 38° F. and for July 59° F. Throughout nearly the whole of the 19th century East Lothian agriculture was held to be the best in Scotland, not so much in consequence of the natural fertility of the soil as because of the enterprise of the cultivators, several of whom, like George Hope of Fenton Barns (181-1876), brought scientific farming almost to perfection. Mechanical appliances were adopted with exceptional alacrity, and indeed some that afterwards came into general use were first employed in Haddington. Drill sowing of turnips dates from 1734. The threshing machine invented by Andrew Meikle (1710-1790), the steam plough in 1862, and the reaping machine soon after its invention, while tile draining was first extensively used in the county. East Lothian is famous for the richness of its grain and green crops, the size of its holdings (average 200 acres) and the good housing of its labourers. The soils vary. Much of the Lammermuirs is necessarily unproductive, though the lower slopes are cultivated, a considerable tract of the land being very good. In the centre of the shire occurs a belt of tenacious yellow clay on a tilly subsoil which is not adapted for agriculture. Along the coast the soil is very fertile, but sea-water has been driven over the raised beach and has produced of rich loam and is very fertile. The land about Dunbar is the most productive, yielding a potato—the "Dunbar red"—which is highly esteemed in the markets. Of the grain crops oats and barley are the principal, and their acreage is almost a constant, but wheat, after a prolonged decline, has experienced a revival. Turnips and potatoes are cultivated extensively, and with marked success, and constitute nearly all the green crops raised. Although pasture-land is below the average, live-stock are reared profitably. About one-sixteenth of the total area is in tillage.

Industries.—Fisheries are conducted from Dunbar, North Berwick, Port Seton and Prestonpans, the catch consisting chiefly of cod, haddock, whiting and shellfish. Fireclay as well as limestone is worked, but there are some stone quarrries, but the manufactures are mainly agricultural implements, pottery, woolens, artificial manures, feeding-stuffs and salt, besides brewing. Coal of a very fair quality is extensively worked at Tranent, Ormiston, Macmerry and near Prestonpans, the coal-field having an area of about 30 sq. m. Limestone is found throughout the greater part of the shire. A vein of hematie of a peculiarly fine character was discovered in 1866 at Garleton Hill, and wrought for some years. Ironstone has been mined at Macmerry.

The North British Company possess the sole running powers in the county, through which is laid their main line to Berwick and the south. Branches are sent off at Drem to North Berwick, at Longniddry to Haddington and also to Gullane, at Smeaton (in Mid-Lothian) to Macmerry, and at Ormiston to Gifford.

Population and Government.—The population was 37,537 in 1801, and 38,665 in 1811. The whole county is spoken in English and Gaelic, and 7 spoke Gaelic only. The chief towns are Dunbar (pop. in 1901, 3,581), Haddington (3903), North Berwick (2890), Prestonpans (2614) and Tranent (2384). The county, which returns one member to Parliament, forms part of the sheriffdom of the Lothians and Peebles, and there is a resident sheriff-substitute at Haddington, who sits also at Dunbar, Tranent.
HADDOCK—HADEN, SIR F. S.

and North Berwick. The shire is under school-board jurisdiction, and besides high schools at Haddington and North Berwick, some of the elementary schools earn grants for higher education. The county council spends a proportion of the "residue" grant in supporting short courses of instruction in technical subjects (chiefly agriculture), in experiments in the feeding of cattle and the growing of crops, and in defraying the travelling expenses of technical students.

History.—Of the Celts, who were probably the earliest inhabitants, traces are found in a few place names and circular camps (in the parishes of Garvald and Whittinghame) and hill forts (in the parish of Bruny). Roman remains of varying importance, of which a description is given in Sir J. Miller, History of Haddington (1844), are by no means rare. In the time of King Malcolm II., the district formed part of the Saxon kingdom of Northumbria until 1018, when it was joined to Scotland by Malcolm II. It was comparatively prosperous till the wars of Bruce and Balliol, but from that period down to the union of the kingdoms it suffered from its nearness to the Border and from civil strife. The last battles fought in the county were those of Dunbar (1500) and Prestonpans (1745).

See J. Miller, History of Haddington (1844); D. Croal, Sketches of East Lothian (Haddington, 1875); John Martine, Reminiscences of the Early Days of Haddington (1883); H. H. James, Writings and Writts of Haddington (Haddington, 1898).

HADDOCK (Gadus aeglefinus), a fish which differs from the cod in having the mental barbel very short, the first anal fin with 22 to 25 rays, instead of 17 to 20, and the lateral line dark instead of whitish; it has a large blackish spot above each pectoral fin—associated in legend with the marks of St. Peter's finger and thumb, the haddock being supposed to be the fish from whose mouth he took the tribute-money. It attains to a weight of 15 lb. and is one of the most valuable food fishes of Europe, both fresh and smoked, the "finnan haddie" of Scotland being famous. It is common round the British and Irish coasts, and generally distributed along the shores of the North Sea, extending across the Atlantic to the coast of North America.

HADDON HALL, one of the most famous ancient mansions in England. It lies on the left bank of the river Wye, 2 m. S.E. of Bakewell in Derbyshire. It is not now used as a residence, but the fabric is maintained in order. The building is of stone and oblong in form, and encloses two quadrangles separated by the great banquetting-hall and adjoining chambers. The greater part is of two storeys, and surmounted by battlements. To the south front of the eastern quadrant is occupied by the splendid ball-room or long gallery. At the south-west corner of the mansion is the chapel; at the north-east the Peveril tower. The periods of building represented are as follows. Norman work appears in the chapel (which also served as a church for the neighbouring villagers), also in certain fundamental parts of the fabric, notably the Peveril tower. There are Early English and later additions to the chapel; the banquetting-hall, with the great kitchen adjacent to it, and part of the Peveril tower are of the 14th century. The eastern range of rooms, including the state rooms, are of the 15th century; the western and north-western parts were built shortly after 1500. The ball-room is of early 17th-century construction, and the terraces and gardens were laid out at this time. A large number of interesting contemporary fittings are preserved, especially in the banquetting-hall and kitchen; and many of the rooms are adorned with tapestries of the 16th and 17th centuries, some of which came from the famous works at Mortlake in Surrey.

A Roman altar was found and is preserved here, but no trace of Roman inhabitants has been discovered. Haddon was a manor which before the Conquest and at the time of the Domesday Survey belonged to the king, but was granted by William the Conqueror to William Peverel, whose son, another William Peverel, forfeited it for treason on the accession of Henry II. Before that time, however, the manor of Haddon had been granted to the family of Avenell, who continued to hold it until one William Avenell died without male issue and his property was divided between his two daughters and heirs, one of whom married Richard Vernon, whose successors acquired the other half of the manor in the reign of Edward III. Sir George Vernon, who died in 1561, was known as the "King of the Peak" on account of his hospitality. His daughter Dorothy married John Manners, second son of the earl of Rutland, who is said to have lived for some time in the woods round Haddon Hall, disguised as a gamekeeper, until he persuaded Dorothy to elope with him. On Sir George's death without male issue Haddon passed to John Manners and Dorothy, who lived in the Hall. Their grandson John Manners succeeded to the title of Earl of Rutland in 1641, and the duke of Rutland is still lord of the manor.

See Victoria County History, Derbyshire; S. Rayson, C. History and Antiquities of Haddon Hall (1836–1837); Haddon Hall, History and Antiquities of Haddon Hall (1867); G. le Blanc Smith, Haddon, the Manor, the Hall, its Lords and Traditions (London, 1906).

HADEN, SIR FRANCIS SEYMOUR (1818–1910), English surgeon and etcher, was born in London on the 16th of September 1818, his father, Charles Thomas Haden, being a well-known doctor and amateur of music. He was educated at University College and University College, London, and also studied at the École des Beaux Arts in Paris, where he took his degree in 1840. He was admitted as a member of the College of Surgeons of London in 1842. Besides his many-sided activities in the scientific world, during a busy and distinguished career as a surgeon, he followed the art of original etching with such vigour that he became not only the foremost British exponent of that art but was the principal cause of its revival in England. By his strenuous efforts and perseverance, aided by the secretarial ability of Sir W. R. Drake, he founded the Royal Society of Painter-Etchers and Engravers. As president he ruled the destinies of that society with a strong hand from its first beginnings in 1880. In 1843–1844, with his friends Duval, Le Cannes and Col. Guibout, he had travelled in Italy and made his first sketches from nature. Haden attended no art school and had no art teachers, but in 1845, 1846, 1847 and 1848 he studied portfolios of prints belonging to an old second-hand dealer named Love, who had a shop in Bunhill Row, the old Quaker quarter of London. These portfolios he would carry home, and arranging the prints in chronological order, he studied the works of the great original engravers, Dürer, Lucas van Leyden and Rembrandt. These studies, besides influencing his original work, led to his important monograph on the etched work of Rembrandt, published in 1846. He then returned to the south front of the eastern quadrant of the manor-house of Haddon, and went on to the south-west corner of the mansion, where he added a large Gothic window which was his "Calais Pier," which is a classical example of what interpretative work can do in black and white. Of his original plates, more than 200 in number, one of the most notable was the large "Bronze Age of the North," an early plate rare and most beautiful, is "Thames Fisherman," "Myttal Hall" is broad in treatment, and a fine rendering of a shady avenue of yew trees leading to an old manor-house in sunlight. "Sub Tegmine" was etched in Greenwich Park in 1839; and "Early Morning—Richmond," full of the poetry and freshness of the hour, was done, the artist has said, actually at sunrise. One of the rarest and most beautiful of his plates is "A By-Road in Tipperary"; "Combe Bottom" is another; and "Shere Mill Pond" (both the small study and the larger plate), "Sunset in
IRELAND," "Penton Hook," "Grim Spain" and "Evening Fishing, Longparish," are also notable examples of his genius. A catalogue of his works was begun by Sir William Drake and completed by Mr. N. Harrington (1880). During later years Haden began to practise the sister art of mezzotint engraving, with a measure of the same success that he had already achieved in pure etching and in dry-point. Some of his mezzotints are: "An Early Riser," a stag scene; "Grayling Fishing" and "A Salmon Pool on the Spey." He also produced some remarkable drawings of trees and park-like country in charcoal.

Other books by Haden not already mentioned are—are "Études à l’eau forte" (Paris, 1863); About Etching (London, 1878–1879); The Art of the Painter-Etcher (London, 1890); The Relative Claims of Etching and Engraving to rank as Fine Arts and to be represented in the Royal Academy (London, 1883); Address to Students of Winchester School of Art (Winchester, 1888); Cremation: A Pamphlet (London, 1873); and The Disposal of the Dead, A plea for Legislation (London, 1888). As the last two indicate, he was an ardent champion of a system of "earth to earth" burial.

Among numerous distinctions he received the Grand Prix, Paris, in 1889 and 1900, and was made a member of the Institut de France, Académie des Beaux-Arts and Société des Artistes Français. He was knighted in 1894, and died on the 1st of June 1910. He married in 1847 a sister of the artist J. A. M. W. Whistler; and his elder son, Francis Seymour Haden (b. 1850), had a distinguished career as a member of the government in Natal from 1877. He was made a C.M.G. in 1890. (C.H.)*

HADENDOAR (from Beja Haday, chief, and endowe, people), a nomad tribe of Africans of "Hamitic" origin. They inhabit that part of the eastern Sudan extending from the Abyssinian frontier northward nearly to Suakin. They belong to the Beja people, of which, with the Bisharin and the Ababa, they are the modern representatives. They are a pastoral people, ruled by a hereditary chief who is directly responsible to the (Anglo-Egyptian) Sudan government. Although the official capital of the Hadendoar country is Mikhath, the town of Filihik on an affluent of the Atbara is really their headquarters. A third of the total population is settled in the Suakin country. Osman Digna, one of the best-known chiefs during the Madhia, was a Hadendoar, and the tribe contributed some of the fiercest of the dervish warriors in the wars of 1883–85. So determined were they in their opposition to the Anglo-Egyptian forces that the name Hadendoar grew to be nearly synonymous with "rebel." But this was the result of Egyptian misgovernment rather than religious enthusiasm; for the Hadendoar are true Beja, and Mahometans only in name, having gained the name of "Fuzzy-wuzzies" among the British troops. They earned an unenviable reputation during the wars by their hideous mutilations of the dead on the battlefields. After the reconquest of the Egyptian Sudan (1896-98) the Hadendoar accepted the new order without demur.

See Anglo-Egyptian Sudan, edited by Count Gleichen (London, 1905); Sir F. K. Wingate, Mahdism and the Egyptian Sudan (London, 1891); G. Sergi, Africa: An anthropology of the Hamitic Race (1897); A. H. Keane, Ethnology of the Egyptian Sudan (1884).

HADERSLEBEN (Dan. Hadersle), a town of Germany, in the Prussian province of Schleswig-Holstein, 31 m. N. from Flensburg. Pop. (1905) 9289. It lies in a pleasant valley on the Hadersleben fjord, which is about 9 m. in length, and communicates with the Little Belt, and at the junction of the main line of railway from Woyens with three vicinal lines. The principal buildings are the beautiful church of St Mary, dating from the 13th century, the theological seminary established in 1870, the gymnasium and the hospital. The industries include iron founding, tanning, and the manufacture of machines, tobacco and gloves. The harbour is only accessible to small vessels.

Hadersleben is first mentioned in 1228, and received municipal rights from Duke Waldemar II. in 1292. It suffered considerably during the wars between Schleswig and Holstein in the 15th century. In November 1864 it passed with Schleswig to Prussia. Two Danish kings, Frederick II. and Frederick III., were born at Hadersleben.

See A. Sach, Der Ursprung der Stadt Hadersleben (Hadersleben, 1892).

HADING, JANE (1859- ), French actress, whose real name was Jeanne Alfrédé Tréfournier, was born on the 25th of November 1859 at Marseilles, where her father was an actor at the Gymnasium. She was trained at the local Conservatoire and was engaged in 1873 for the theatre at Algiers, and afterwards for the Khedivial theatre at Cairo, where she played, in turn, coquette, soubrette and ingénue parts. Expectations had been raised by her voice, and when she returned to Marseilles she sang in operetta, besides acting in Ruy Blas. Her Paris début was in La Chaste Suzanne at the Palais Royal, and she was again heard in opera at the Renaissance. In 1883 she had a great success in opera at the Gymnasium in Le Moititre de forges. In 1884 she married Victor Koning (1842-1894), the manager of that theatre, but divorced him in 1887. In 1888 she toured America with Coquelin, and on her return helped to give success to Lavedan's Prince d'Auric, at the Vaudeville. Her reputation as one of the leading actresses of the day was now established not only in France but in America and England. Her later répertoire included Le Demi-monde, Capus's La Châteauise, Maurice Donnay's Retour de Jérusalem, La Princesse Georges by Dumas fils, and Émile Bergerat's Plais que reine.

HADLEY, a market town, in the Sudbury parliamentary division, county of Suffolk, England; 25 m. N.E. from London, the terminus of a branch of the Great Eastern railway. Pop. of urban district (1901), 3245. It lies pleasantly in a well-wooded country on the small river Brett, a tributary of the Stour. The church of St Mary is of good Perpendicular work, with Early English tower and Decorated spire. The Rectory Tower, a turretted gate-house of brick, dates from c. 1495. The gild-hall is a Tudor building, and there are other examples of this period. There are a town-hall and corn exchange, and an industry in the manufacture of matting and in making. Hadleigh was one of the towns in which the woolen industry was started by Flemings, and survived until the 18th century. Among the rectors of Hadleigh several notable names appear, such as Rowland Taylor, the martyr, who was burned at the stake outside the town in 1555, and Hugh James Rose, during whose tenancy of the rectory an initiatory meeting of the leaders of the Oxford Movement took place here in 1833.

Hadleigh, called by the Saxons Heaple-leag, appears in Domesday Book as Hetlega. About 885 Æthelbade, lady of the Mercians, with the consent of Æthelred her husband, gave Hadleigh to Christ Church, Canterbury. The dean and chapter of Canterbury have held possession of it ever since the Dissolution. In the 17th century Hadleigh was famous for the manufacture of cloth, and in 1618 was sufficiently important to receive incorporation. It was constituted a free borough under the title of the mayor, aldermen and burgesses of Hadleigh. In 1635, in a list of the corporate towns of Suffolk to be assessed for ship money, Hadleigh is named as third in importance. In 1636, owing to a serious visitation of the plague, 200 families were thrown out of work, and in 1661 so much had its importance declined that it was deprived of its charter. An unsuccessful attempt to recover it was made in 1701. There is evidence of the existence of a market here as early as the 13th century. James I., in his charter of incorporation, granted fairs on Monday and Tuesday in Whitsun week, and confirmed an ancient fair at Michaelmas and a market on Monday.

HADLEY, ARTHUR TWING (1856- ), American political economist and educatorist, president of Yale University, was born in New Haven, Connecticut, on the 23rd of April 1856. He was the son of James Hadley, the philologist, from whom, as from his mother—whose brother, Alexander Catlin Twining (1801-1884), was an astronomer and authority on constitutional law—he inherited unusual mathematical ability. He graduated at Yale in 1876 as valedictorian, having taken prizes in English, classics and astronomy; studied political
science at Yale (1876-1877) and at Berlin (1878-1879); was a tutor at Yale in 1879-1883, instructor in political science in 1883-1886, professor of political science in 1886-1891, professor of political economy in 1891-1899, and dean of the Graduate School in 1892-1895; and in 1899 became president of Yale University—the first layman to hold that office. He was commissioner of the Connecticut bureau of labour statistics in 1885-1887. As an economist he first became widely known through his investigation of the railway question and his study of railway rates, which anticipated the popular excitement as to rebates. His Railroad Transportation, its History and Laws (1886) became a standard work, and appeared in Russian (1886) and French (1887); he testified as an expert on transportation before the Senate committee which drew up the Interstate Commerce Law; and wrote on railways and transportation for the Ninth and Tenth Editions (of which he was one of the editors) of the Encyclopaedia Britannica, for Lalor's Cyclopedia of Political Science, Political Economy, and Political History of the United States (3 vols., 1881-1884), for The American Railway (1888), and for The Railroad Gazette in 1884-1891, and for other periodicals. His ideas on the relations of ethics in relation to political economy and business, is expressed in his writings and public addresses. In 1907-1908 he was Theodore Roosevelt professor of American History and Institutions in the university of Berlin.

Among his other publications are: Economics: an Account of the Relations between Private Property and Public Welfare (1865); The Educational and Social Value of the Indian (1909), being the Kennedy Lectures for 1909; Freedom and Responsibility in the Evolution of Democratic Government (1903, in Yale Lectures on the Responsibilities of Citizenship); Bacalauristre Adresses (1897); and Standards of Public Morality (1909).

HADLEY, JAMES (1821-1872), American scholar, was born on the 30th of March 1821 in Fairfield, Herkimer county, New York, where his father was professor of chemistry in Fairfield Medical College. At the age of nine an accident lamened him for life. He graduated from Yale in 1842, having entered the Junior class in 1840; studied in the Theological Department of Yale, and in 1844-1845 was a tutor in Middlebury College. He was tutor at Yale in 1845-1848, assistant professor of Greek in 1848-1851, and professor of Greek, succeeding President Woolsey, from 1851 until his death in New Haven on the 14th of November 1872. As an undergraduate he showed himself a remarkable mathematician, but the influence of Edward Elbridge Salisbury, under whom Hadley and W. D. Whitney studied Sanskrit together, turned his attention toward the study of language. He knew Greek, Latin, Sanskrit, Hebrew, Arabic, Armenian, several Celtic languages and the languages of modern Europe; but he published little, and his scholarship found scant outlet in the college class-room. His most original written work was an essay on Greek accent, published in a German version in Curtius's Studien zur griechischen und lateinischen Grammatik. Hadley's Greek Grammar (1860; revised by Frederic de Forest Allen, 1884) was based on Curtius's Schulegrammatik (1852, 1855, 1857, 1859), and long held its place in American schools. Hadley was a member of the American Committee for the revision of the New Testament, was president of the American Oriental Society (1871-1872), and contributed to Webster's dictionary an essay on the History of the English Language. In 1873 were published his Introduction to Roman Law (edited by T. D. Woolsey) and his Essays, Philological and Critical (edited by W. D. Whitney).

HADLEY, a township of Hampshire county, Massachusetts, U.S.A., on the Connecticut river, about 20 m. N. of Springfield, served by the Boston & Maine railway. Pop. (1900), 1789; (1905, state census), 1895; (1910) 1999. Area, about 20 sq. m. The principal villages are Hadley (or Hadley Center) and North Hadley, both once independent towns as well as villages, but now incorporated into Hadley. Tobacco culture, and the villages are engaged in the manufacture of tobacco and brooms. Hadley was settled in 1659 by members of the churches in Hartford and Wethersfield, Connecticut, who were styled "Strict Congregationalists" and withdrew from these Connecticut congregations because of ecclesiastical and doctrinal laxity there. At first the town was called Norwottuck, but within a year or two it was named after Hadleigh in England, and was incorporated under this name in 1661. Hopkins Academy (1815) developed from Hopkins school, founded here in 1804. The English regicide Edward Whalley and his son-in-law William Goile found a refuge at Hadley from 1664 apparently until their deaths, and there is a tradition that Goile or Whalley in 1665-1667 explored the land now called Hadley to the Connecticut river. In 1713 Hadley, being in almost constant danger of attack by the Indians, was protected by a palisade enclosure and by stockades around the meeting-house. From Hadley, Hatfield was set apart in 1670, South Hadley in 1735, and Amherst in 1750.

HADRUMUT, a district on the south coast of Arabia, bounded W. by Yemen, E. by Oman and N. by the Dahna desert. The modern Arabs restrict the name to the coast between Balhaf and Shihut, and the valley of the Wadi Hadramut in the interior; in its wider and commonly accepted signification it includes also the Mahra and Gara coasts extending eastwards to Mirbat; thus defined, its limits are between 14° and 18° N. and 47° to 55° E., with a total length of 550 m. and a breadth of 150 m. The Hadramut is divided into a number of wadis, which extend to the sea both north and south of the desert, and in places the hills extend to the seashore. The principal ports are Mukalla, Shihir, both considerable towns, and Kusair and Ralda, small fishing villages; inland there are a few villages near the foot of the hills, with a limited area of cultivation irrigated by springs or wells in the hill torrent beds. Behind the littoral plain a range of mountains, or rather a high plateau, falling steeply to the south and more gently to the north, extends continuously from the coast to the desert, a plateau of hard sandstone rock, from which a similar range extends with hardly a break to the border of Oman. Its crest-line is generally some 30 m. from the coast, and the average height between 400 and 500 ft. A number of wadies or ravines cutting deeply into the plateau run northward to the main Wadi Hadramut, a broad valley lying nearly east and west, with a total length from its extreme western heads on the Yemen highlands to its mouth near Shihut of over 500 m. Beyond the valley and steadily encroaching on it lies the great desert extending for 300 m. to the borders of Nejd. The most westerly village in the main valley is Shabwa, in ancient days the capital, but now almost buried by the advancing desert. Lower down the first large villages are Henân and Ajâniâ, near which the wadis 'Amâd, Dûwán and el 'Ain unite, forming the W. Kâsîr. In the W. Dûwán and its branches are the settlements of Dûwán, el Kâbl, Kûsaq, and Ismar. For some 60 m. there is a succession of villages with fields, gardens and date groves; several tributaries join on either side, among which the W. bin Ali and W. Adîn from the south contain numerous villages. They are principally el Kusair, Tarîba, el Gharâf, Tarîm, formerly the chief place, 'Ainat and el Kasîm. Below the last-named place there is little cultivation or settled population. The shrines of Kâbûr Sîlîb and Kâbûr Hud are looked on as specially sacred, and are visited by numbers of pilgrims. The former, which is in the Wadi Ser about 20 m. N.W. of Shihbat, was explored by Theodore Bent in 1894; the tomb itself is of no interest, but in the neighbourhood there are extensive ruins with Hieratic inscriptions on the stones. Kâbûr Hud is in the main valley some distance east of Kasîm; not far from it is Bir Borût, a natural crater, which is fumed with sulphurichfumes from a number of hot springs; on it is the town of Harîf; the latter is an active volcano. Except after heavy rain, there is no running water in the Hadramut valley, the cultivation therefore depends on artificial irrigation from wells. The principal crops are rice, millet, indges, dates and tobacco; this latter, known as Humami tobacco, is of excellent quality.

Hadramut has preserved its name from the earliest times; it occurs in Genesas as Hâzarmavath and Hâdoram, sons of Joktan; and the old Greek geographers mention Adromytta and Chadaramotes in their accounts of the frankincense country. The numerous ruins discovered in the W. Dûwán and Adîm, as well as in the main valley, are evidences of its former prosperity and civilization.

Hadramut, known as Hadrâm (plural Hâdrâm), belong generally to the southern Arabian stock, claiming descent from Ya'rab bin Kahtân. There is, however, a large number of
Seyyids or descendants of the Prophet, and of townsman of northern origin, Besides a considerable class of African or mixed descent. Van den Berg estimates the total population of Hadrmat (excluding the Mahra and Gâta) at 150,000, of which he locates 50,000 in the valley between Shibâm and Tarim, 25,000 in the W. Duwân and its tributaries, and 25,000 in Mukalla, Shahr and the coast villages, leaving 50,000 for the non-agriculturals scattered over the rest of the country, probably an excessive estimate.

The Seyyids, descendants of Hôsain, grandson of Mahomet, form a numerous and highly respected aristocracy. They are divided into families, the chiefs of which are known as Munsibs, who are looked on as the religious leaders of the people, and are even in some cases venerated as saints. Among the leading families are the Sheikh Abu Bakr of Ainât, the el-Aidrus of Shahr and the Sakkâf of Saiyan. They do not bear arms, nor occupy themselves in trade or manual labour or even agriculture; though owning a large portion of the land, they employed slaves or hired labourers to cultivate it. As compared with the other classes, they are well educated, and are strict in their observance of religious duties, and owing to the respect due to their descent, they exercise a strong influence both in temporal and spiritual affairs.

The tribesmen, as in Arabia generally, are the predominant class in the population; all the adults carry arms; some of the tribes have settled towns and villages, others lead a nomadic life, keeping, however, within the territory which is recognized as belonging to them. They have a system of subsections, each headed by a chief or abu (lit. father), while the head of the tribe is called the mukaddam or sultan; the authority of the chief depends largely on his personality: he is the leader in peace and in war, but the tribesmen are not his subjects; he can only rule with their support. The most powerful tribe at present in Hadrmat is the Kaitî, a branch of the Yâfa tribe whose settlements lie farther west. Originally invited by the Seyyids to protect the settled districts from the attacks of marauding tribes, they have established themselves as practically the rulers of the country, and now possess the coast district with the towns of Shahr and Mukalla, as well as Hajar, Hijûân and Shibâm in the interior. The head of the family has accumulated great wealth, and risen to the highest position in the service of the nizam of Hyderabad in India, as Jamadar, or commander of an Arab levy composed of his tribesmen, numbers of whom go abroad to seek their fortune. The Kaitî tribe was formerly the most powerful; they occupy the towns of Saiyan, Tarim and el-Ghuraf in the richest part of the main Hadrmat valley. The chiefs of both the Kaitî and Kaitûre are in political relations with the British government, through the resident at Aden (q.v.).

The town of Duwân is the chief centre of the Hadramut. Though the Duwân is divided into districts, each ruled by a chief, the district of Shibâm, which is situated in the interior of the Hadramout, is the most extensive and important. It is divided into the following subdivisions: 1. Shibâm, a large town situated on the coast; 2. Shibâm, a chief's town located near the coast; 3. Shibâm, a village situated inland; 4. Shibâm, a town on the coast between Shibâm and Dar. These towns are inhabited by the Mursîs, a tribe of desert dwellers, who are engaged in the trade of Hadrmat proper, and extends along the coast from Shibût eastward to the east of Kamar Bay, where the Gâta coast begins and stretches to Mirbat. The sultan of the Mahra, to whom Sokota also belongs, lives at Kishin, a poor village consisting of a few scattered houses about 30 m. west of Râ's Fartak. Shibût is a similar village 20 m. farther west. The mountains rise to a height of 4000 ft. within a short distance of the coast, while the plains are composed of places with trees, among which are the myrrh- and frankincense-bearing shrubs, and the gumin, for which the coast was celebrated in ancient days, are still produced; the best quality is obtained in the Gâta country, on the northern slope of the mountains.

The Mahra country adjoins the Hadrmat proper, and extends along the coast from Shibût eastward to the east of Kamar Bay, where the Gâta coast begins and stretches to Mirbat. The sultan of the Mahra, to whom Sokota also belongs, lives at Kishin, a poor village consisting of a few scattered houses about 30 m. west of Râ's Fartak. Shibût is a similar village 20 m. farther west. The mountains rise to a height of 4000 ft. within a short distance of the coast, while the plains are composed of places with trees, among which are the myrrh- and frankincense-bearing shrubs, and the gumin, for which the coast was celebrated in ancient days, are still produced; the best quality is obtained in the Gâta country, on the northern slope of the mountains.

Shahr and the mountains behind it were visited and surveyed by Mr Bent's party in 1894. There are several thriving villages on the coast, of which el-Hafa is the principal port of export for frankincense; 9000 cwt. is exported annually to Bombay.

Ruins of Sabaeans buildings were found by J. T. Bent in the neighbourhood of Dhafer, and a remarkable cove or small harbour was discovered at Khor Kori, which he identified with the ancient port of Omana.

Bent, Southern Arabia (London, 1865); A. von Wrede, Ritter im Hadrmat (Munich, 1879); H. J. C. Carter, The Hadramut and Shihor Bay As. Soc. (1845), 47–51; Journal R.G.S. (1837). (R. A. W.)

HADRIA (mod. Atri q.v.), perhaps the original terminal point of the Via Caecilia, Italy. It belonged to the Praetutii. It became a colony of Rome in 290 B.C. and remained faithful to Rome. The coins which it issued (probably during the Punic Wars) are remarkable. The crypt of the cathedral of the modern town was originally a large Roman cistern; another forms the foundation of the ducal palace; and in the eastern portion of the town is a complicated system of underground passages for collecting and storing water.

See Notizie degli scavi (1902), 3. (T. As.)

HADRIAN (PUBLIUS AELIUS HADRIANUS), Roman emperor AD. 117–138, was born on the 24th of January AD. 76, at Italica in Hispania Baetica (according to others, at Rome), where his ancestors, originally from Hadria in Picenum, had been settled since the time of the Scipios. On his father's death in 85 or 86 he was placed under the guardianship of two fellow-countrymen, his kinsman Upius Trajanus (afterwards the emperor Trajan), and Caelius Attianus (afterwards prefect of the praetorian guard). He spent the next five years at Rome, and at the age of fifteen returned to his native place and entered upon a brilliant career. He went to Rome by Trajan, and appointed to the offices of decemvir stilitibus judicandis, praefectus ferrarium Latinarum, and semis turmae equestri Romanorum. About 95 he was military tribune in lower Moesia. In 97 he was sent to upper Germany to convey the congratulations of the army to Trajan on his adoption by Nerva; and, in January of the following year, he hastened to announce the death of Nerva to Trajan at Cologne. Trajan, who had been set against Hadrían by reports of his extravagance, took him into favour again, chiefly owing to the goodwill of the empress Plotina, who brought about the marriage of Hadrían with (Vibia) Sabina, Trajan's great-niece. In 101 Hadrían was quaestor, in 103 tribune of the people, in 106 praetor. He served with distinction in both Dacian campaigns; in the second Trajan presented him with a valuable ring which he himself had received from Nerva, a token of regard which seemed to designate Hadrían as his successor. In 107 Hadrían was legatus praetoris of lower Pannonia, in 108 consul suffectus, in 112 archon at Athens, legalis in the Parthian campaign (113–117), in 117 consul designatus for the following year, in 119 consul for the third and last time only for four months. When Trajan, owing to a severe illness, decided to return home from the East, he left Hadrían in command of the army and governor of Syria. On the 9th of August 117, Hadrían, at Antioc, was informed
of his adoption by Trajan, and, on the 11th, of the death of the latter at Selinus in Sicilia. According to Dio Cassius (lxxix. 1) the adoption was entirely fictitious, the work of Plotina and Attianus, by whom Trajan’s death was concealed for a few days in order to facilitate the elevation of Hadrian. Whichever may have been the truth, his succession was confirmed by the army and the senate. He hastened to propitiate the former by a donation of 12,000,000 sesterces, and excused his hasty acceptance of the throne by alleging the impatient zeal of the soldiers and the necessity of an imperator for the welfare of the state.

Hadrian’s first important act was to abandon as untenable the conquests of Trajan beyond the Euphrates (Assyria, Mesopotamia and Armenia), a recurrence to the traditional policy of Augustus. The provinces were unsettled, the barbarians on the borders restless and menacing, and Hadrian wisely judged that the old limits of Augustus afforded the most defensible frontier. Mesopotamia and Assyria were given back to the Parthians, and the Armenians were allowed a king of their own. From Antioch Hadrian set out for Dacia to punish the Roxolani, who, incensed by a reduction of the tribute hitherto paid them, had invaded the Danubian provinces. An arrangement was patched up, and while Hadrian was still in Dacia he received news of a conspiracy against his life. Four citizens of consular rank were accused of being concerned in it, and were put to death by order of the senate before he could interfere. Hurrying back to Rome, Hadrian endeavoured to remove the unfavourable impression produced by the whole affair and to gain the goodwill of senate and people. He threw the responsibility for the executions upon the prefect of the praetorian guard, and swore that he would never punish a senator without the assent of the entire body, to which he expressed the utmost deference and consideration. Large sums of money and games and shows were provided for the people, and, in addition, all the arrears of taxation for the last fifteen years (about £10,000,000) were cancelled and the bonds burnt in the Forum of Trajan. Trajan’s scheme of the almshouses (villae dole) of poor children was carried out upon a larger scale under the superintendence of a special official called praefectus alimentorum.

The record of Hadrian’s journeys1 through all parts of the empire forms the chief authority for the events of his life down to his final settlement in the capital during his last years. They can only be briefly touched upon here. His first great journey probably lasted from 121 to 126. After traversing Gaul he visited the Germanic provinces on the Rhine, and crossed over to Britain (spring, 123), where he built the great rampart from the Tyne to the Solway, which bears his name (see Britannia Roman). He returned through Gaul into Spain, and then proceeded to Mauretania, where he suppressed an insurrection. A war with the Parthians was averted by a personal interview with their king (125). From the Parthian frontier he travelled through Asia Minor and the islands of the Aegean to Athens (autumn, 125), where he introduced various political and commercial changes, was initiated at the Eleusinia, and presided at the celebration of the greater Dionysia. After visiting Central Greece and Peloponnesus, he returned by way of Sicily to Rome (end of 126). The next winter was spent in Africa; he set out on his second great journey (September 128). He travelled by way of Athens, where he completed and dedicated the buildings (see ATHENS) begun during his first visit, chief of which was the Olimpium or temple of Olympian Zeus, on which occasion Hadrian himself assumed the name of Olympius. In the spring of 129 he visited Asia Minor and Syria, where he invited the kings and princes of the East to a meeting (probably at Samosata). Having passed the winter at Antioch, he set out for the south (spring, 130). He ordered Jerusalem to be rebuilt (see JERUSALEM) under the name of Aelia Capitolina, and made his way through Arabia to Egypt, where he restored the tomb of Pompey at Pelusium with great magnificence. After a short stay at Alexandria he took an excursion up the Nile, during which he lost his favourite Antinous. On the 21st of November 130, Hadrian (or at any rate his wife Sabina) heard the music which issued at sunrise from the statue of Memnon at Thebes (see MEMNON). From Egypt Hadrian returned to Sinope (131) where he left his personal attention (this is denied by some historians) to the revolt of the Jews, which had broken out (autumn, 131, or spring, 132) after he had left Syria. The founding of a Roman colony on the site of Jerusalem (Dio Cass. lxxix. 12) and the prohibition of circumcision (Spartianus, HADRIANUS, 14) are said to have been the causes of the war, but authorities differ considerably as to this and as to the measures which followed the revolt (see ART. JEWS; also E. Schubert, Hist. of the Jewish People, Eng. ed., vol. ii. p. 285; S. Krauss in Jewish Ency. s. v. “Hadrian”), which lasted till 135. Leaving the conduct of affairs in the hands of his most capable general, Julius Severus, in the spring of 134 Hadrian returned to Rome. The remaining years of his life were spent partly in the capital, partly in his villa at Tibur. His health now began to fail, and it became necessary for him to choose a successor, as he had no children of his own. Against the advice of his relatives and friends he adopted L. Ceionius Commodus under the name of L. Aelius Caesar, who was in a feeble state of health and died on the 1st of January 138, before he had an opportunity of proving his capabilities. Hadrian’s adoption of Antoninus (see ANTONINUS PIUS) on condition that he should adopt M. Annius Verus (afterwards the emperor Marcus Aurelius) and the son of L. Aelius Caesar, L. Ceionius Commodus (afterwards the emperor Commodus). Hadrian died at Baiae on the 10th of July 138.

He was without doubt one of the most capable emperors who ever occupied the throne, and devoted his great and varied talents to the interests of the state. One of his chief objects was the abolition of distinctions between the provinces and the mother country, finally carried out by Caracalla, while at the same time he did not neglect reforms that were urgently called for in Italy. Provincial governors were kept under strict supervision; extortion was practically unheard of; the jus Latii was bestowed upon several communities; special officials were instituted for the control of the finances; and the emperor’s interest in provincial affairs was shown by his personal assumption of various municipal offices. New towns were founded and old ones restored; new streets were laid out, and aqueducts, temples and magnificent buildings constructed. In Italy itself the admin-
enforced; the master was forbidden to put his slave to death, but was obliged to bring him before a court of justice; if he ill-treated him it was a penal offence. The sale of slaves (male and female) for immoral and gladiatorial purposes was forbidden; the custom of putting all the household to death when their master was murdered was modified. The public baths were kept under strict supervision; the toga was ordered to be worn in public by senators and equites on solemn occasions; extravagant banquets were prohibited; rules were made to prevent the congestion of traffic in the streets. In military matters Hadrian was a strict disciplinarian, but his generosity and readiness to share his hardships endeared him to the soldiers. He effected a material and moral improvement in the conditions of service and mode of life, but in other respects he does not appear to have introduced any important military reforms. During his reign an advance was made in the direction of creating an organized body of servants at the disposal of the emperor by the appointment of equites to important administrative posts, without their having performed the militiae equestres (see Equites). Among these posts were various procuratorships (chief of which was that of the imperial fisc), and the offices ab epistulis, a rationibus and a libellis (secretary, accountant, receiver of petitions). The prefect of the praetorian guard was now the most important person in the state next to the emperor, and subsequently became a supreme judge of appeal. Among the magnificent buildings erected by Hadrian mention may be made of the following of both Latin and Greek authors. The altar and temple of Venus and Roma; his splendid mausoleum, which formed the groundwork of the castle of St Angelo; the pantheon of Agrippa; the Basilica Neptuni; at Tivur the great villa 8 m. in extent, a kind of epi-
tome of the world, with miniatures of the most celebrated places in the provinces. Athens, however, was the favourite site of his architectural labours; here he built the temple of Olympian Zeus, the Panhellenion, the Pantheon, the library, a gymnasium and a temple of Hera.

Hadrian was fond of the society of learned men—poets, scholars, rhetoricians and philosophers—whom he alternately, humoured and ridiculed. In painting, sculpture and music he considered himself the equal of specialists. The architect Apollodoros of Damascus owed his banishment and death to his outspoken criticism of the emperor's plans. The sophist Favorinus was more politic; when reproached for yielding too readily to the emperor in some grammatical discussion, he replied that it was unwise to contradict the master of thirty legions. The Athenaeum (q.v.) owed its foundation to Hadrian. He was a man of considerable intellectual attainments, of prodigious memory, master of both Latin and Greek, and wrote prose and verse with equal facility. His taste, however, was curious; he preferred Cato the elder, Ennius and Caecilius Antipater to Cicero, Virgil and Sallust, the obscure poet Antimachus to Homer and Plato. As a writer he displayed great versatility. He composed an autobiography, published under the name of his freedman Phlegon; wrote speeches, fragments of two of which are preserved in inscriptions (a panegyric on his mother-in-law Matidia, and an address to the soldiers at Lambaesis in Africa). In imitation of Antimachus he wrote a work called Calachannae, probably a kind of miscellany. In the Latin and Greek anthologies contain about a dozen epigrams under his name. The letter of Hadrian to the consul Servianus (in Vopiscus, Vita Saturvini, 8) is no longer considered genuine. Hadrian's celebrated dying address to his soul may here be quoted:

"Animula vagula, blandula,
Hospes comeque corporis,
Quae nunc abibis in loca
Pallida, rigidta, mutula;
Nec ut soles, dabis jocos?
"

The character of Hadrian exhibits a mass of contradictions, well summed up by Spartianus (14. 11). He was grave and gay, affable and dignified, cruel and gentle, mean and generous, eager for fame yet not vain, impulsive and cautious, secretive and open. He hated eminent qualities in others, but gathered round him the most distinguished men of the state; at one time affectionate towards his friends, at another he mistrusted and pitied them to death. In fact, he was only consistent in his inconsistency (semper in omnibus varius). Although he endeavoured to win the popular favour, he was more feared than loved. A man of unnatural passions and grossly superstitious, he was an ardent lover of nature. But, with all his faults, he devoted himself so indefatigably to the well-being of his state, that the period of his reign could be characterized as a "golden age."

The chief ancient authorities for the reign of Hadrian are: the life by Aelius Spartianus in the Scriptores historiae Augustae (see Augustan History and bibliography); the epitome of Dio Cassius (18. 24. 2); the account of Eusebius in the History of the Church (see ch. Lxvi.); H. Schiller, Geschichte der römischen Kaiserzeit, i. 2, p. 602 (1883); J. B. Bury, The Student's Roman Empire (1893), where a concise table of the journeys is given; P. von Rohden, s.v. "Aelius" (No. 64) in Pauly-Wissowa's Realencyklopädie, i. 1894; J. Dürr, Die Reisen des Kaisers Hadrian (1881); F. Gregorovius, The Emperor Hadrian (Eng. tr. by Mary E. Robinson, 1898); A. Haurath, Neulateinische Zeitgeschichte, iii. (1874); W. Schurz, De mutationibus in imperio ordinando ab imp. Hadr. facit, i. (Bonn, 1883); J. Plew, Quellenuntersuchungen zur Geschichte des Kaisers Hadrian (Tübingen, 1894); T. Schultz, "Lebens des Kaisers Hadrian," Quellenblätter (of St. Blasien, VI, 1900); Kaiser Hadrian und der letzte grosse Historiker von Rom (1905); W. HADRIAN'S WALL—HADRUMETUM

The name usually given to the remains of the Roman fortifications which defended the northern frontier of the Roman province of Britain, between the Tyme and the Solway. The site is served by the modern railways and roads. In a ditch in front and a road behind; (2) various forts, blockhouses and towers along the rampart; and (3) an earthwork to the south of it, generally called the Vallum, of uncertain use. The defensive wall was probably first erected by Hadrian about A.D. 122 as a turf wall, and rebuilt in stone by Septimius Severus about A.D. 208. See further Britain: Roman.

HADRUMETUM, a town of ancient Africa on the southern extremity of the sinus Neapolisius (mod. Gulf of Hammamat) on the east coast of Tunisia. The site is partly occupied by the modern town of Hamed el-Merouana. The name Hadrume-
tum varied much in antiquity; the Greeks called it Λαβρυμ, Λαβρύμων, Λαβρύμων, Λαβρυμ: the Romans Aduamatunum, Adrimatum, Hadrumentum, Hadrumetum, &c.; inscriptions and coins gave Hadrumetum. The town was originally a Phoenician colony founded by Tyrians long before Carthage (Sallust, Jug. 19). It became subject to Carthage, but lost none of its prosperity. Often mentioned during the Punic Wars, it was captured by Agathocles in 316, and was the refuge of Hannibal and the remnants of his army after the battle of Zama in 202. During the last century it was ravaged by the Romans; after the fall of Carthage in 146 it received an accession of territory and the title of civitas libera (Appian, Punica, xciv.; C.I.L. i. p. 84). Caesar landed there in 46 b.c. on his way to the victory of Thapsus (De bello Afric. iii.; Suetonius, Div. Jul. i., x.).

In the organization of the African provinces Hadrumentum became a capital of the province of Byzaecena. Its harbour was extremely busy and the surrounding country unusually fertile. Trajan made it a Latin colony under the title of Colonia Concius, and Ulpia Traiana. Augustus Frugi (Hadrumentum; a dedication to the emperor Gordian the Good, found by M. Cagnat at Susa in 1883 gives this titles to the town, and at the same time identifies it with Susa. Quarrles arose between Hadrumentum and its neighbour Thysdrus in connexion with the temple of Minerva situated on the borders of their respective territories (Frontinus, Gromatici, ed. Lachmannus, p. 57; Vespasian...
when pros-consul of Africa had to repress a sedition among its inhabitants (Suetonius, Vesp. iv.; Tissot, Fastes de la prov. d’Afrique, p. 66); it was the birthplace of the emperor Albinus. At this period the metropolis of Byzacena was still after Carthage the most important town in Roman Africa. It was the seat of a bishopric, and its bishop is mentioned at the councils of 258, 348, 393 and even later. Destroyed by the Vandals in 434 it was rebuilt by Justinian and renamed Justinianopolis (Procop. De aedificiis, 7. 3). This African invasion at the end of the 7th century destroyed the Byzantine towns, and the place became the haunt of pirates, protected by the Kasbah (citadel); it was built on the substructions of the Punic, Roman and Byzantine acropolises, and is used by the French for military purposes. The Arabic geographer Bakri gave a description of the chief Roman buildings which were standing in his time (Bakri, Descr. de l’Afrique, tr. by de Slane, p. 83 et seq.). The modern town of Susa, despite its commercial prosperity, occupies only a third of the old site.

In 1863 the French engineer, A. Daux, discovered the jetties and the moles of the commercial harbour, and the line of the military harbour (Cothon); both harbours, which were mainly artificial, are entirely silted up. There remains a fragment of the fortifications of the Punic town, which had a total length of 6410 metres, and remains of the substructions of the Byzantine acropolis, of the circus, the theatre, the water cisterns, and of other buildings, notably the interesting Byzantine basilica which is now used as an Arab café (Kahwat-el-Kubba). In the ruins there have been foundnumeous columns of Punic inscriptions, Roman inscriptions and mosaic, among which is one representing Virgil seated, holding the Aeneid in his hand; another represents the Cretan Babylon with Thesues and the Minotaur (Héron de Villefosse, Revue de l’Afrique française, v., December 1887, pp. 384 and 394; Comptes rendus de l’Acad. des Insocr. et Belles-Lettres, 1892, p. 318; other mosaics, ibid., 1896, p. 578; Revue archéol., 1897). In 1904 Dr Carton and the abbé Leynaud discovered huge Christian catacombs with several miles of subterranean galleries to which access is obtained by a small vaulted chamber. In these catacombs we find numerous sarcophagi and inscriptions painted or engraved of the Roman and Byzantine periods (Comptes rendus de l’Acad. des Insocr. et Belles-Lettres, 1904-1907; Carton and Leynaud, Les Catacombes d’Hadrâmûté, Susa, 1905). We can recognize also the Punic and Pagan-Roman cemeteries (C. R. de l’Acad. des Insocr. et Belles-Lettres, 1887; Bull. archéol. du Comité, 1885, p. 149; 1903, p. 157). The town had no Punic coins, but under the Roman domination there were coins from the time of the Republic. These are of bronze and bear the name of the city in abbreviations. Hard or Harens accompanying the busts of Neptune or the Sun. We find also the names of local duumvirs. Under Augustus the coins have on the obverse the imperial effigy, and on the reverse the names and often the effigies of the pro-consuls who governed the province, P. Quintilius Varus, L. Volusius Saturninus and Q. Fabius Maximus Africanus. After Augustus the mint was finally closed.

HAECKEL, ERNST HEINRICH (1834– ), German biologist, was born at Potsdam on the 16th of February 1834. He studied medicine at Berlin, Wurzburg, Breslau and Vienna, having for his masters such men as John F. Müller, R. Virchow and R. A. Kölliker, and in 1857 graduated at Berlin as M.D. and M.Ch. At the wish of his father he began to practise as a doctor in that city, but his patients were few in number, one reason being that he did not wish them to be many, and after a short time he turned to more congenial pursuits. In 1861, at the instance of Carl Gegenbaur, he became Privatdozent at Jena; in the succeeding year he was chosen extraordinary professor of comparative anatomy and director of the Zoological Institute in the same university; in 1865 he was appointed to a chair of zoology which was specially established for his benefit. This last position he retained for 43 years, in spite of repeated invitations to migrate to more important centres, such as Strassburg or Vienna, and at Jena he spent his life, with the exception of the time he devoted to travelling in various parts of the world, whence in every case he brought back a rich zoological harvest. As a field naturalist Haeckel displayed extraordinary power and industry. Among his monographs may be mentioned those on Radiolaria (1862), Siphonophora (1860), Monera (1870), and Calcareaous Sponges (1872), as well as several Challenger reports, viz. Deep-Sea Molluscs (1881), Siphonophora (1888), Deep-Sea Keratous (1889) and Radiolaria (1887), the last being accompanied by 140 plates and enumerating over four thousand new species. This output of systematic and descriptive work would alone have constituted a good life’s work, but Haeckel in addition wrote copiously on biological theory. It happened that just when he was beginning his scientific career Darwin’s Origin of Species was published (1859), and such was the influence it exercised over him that he became the apostle of Darwinism in Germany. He was, indeed, the first German biologist to give a whole-hearted adherence to the doctrine of organic evolution and to treat it as the cardinal conception of modern biology. It was he who first brought it prominently before the notice of German men of science and in his first book on the Radiolaria, which was completely pervaded with its spirit, and later at the congress of naturalists at Stettin in 1863. Darwin himself has placed on record the conviction that Haeckel’s enthusiastic propagation of the doctrine was the chief factor of its success in Germany. His book on General Morphology (1866), published when he was only thirty-two years old, was called by Huxley a suggestive attempt to work out the practical application of evolution to its final results; and if it does not take rank as a classic, it will at least stand out as a landmark in the history of biological doctrine in the 19th century. Although it contains a statement of most of the views with which Haeckel’s name is associated, it did not attract much attention on its first appearance, and accordingly its author rewrote much of its substance in a more popular style and published it a year or two later as the Natural History of Creation (Naturliche Schöpfungsgeschichte), which was far more successful. In it he divided morphology into two sections—tectology, the science of organic individuality; and promorphology, which aims at establishing a crystallography of organic forms. Among other matters, he laid particular stress on the “fundamental law of the Radiolaria,” which capitalizes phylogeny, that the individual organism in its development is to a great extent an epitome of the form-modifications undergone by the successive ancestors of the species in the course of their historic evolution. His well-known “gastraea” theory is an outcome of this generalization. He divided the whole animal creation into two categories—the Protozoa or unicellular animals, and the Metazoa or multicellular animals, and he pointed out that while the former remain single-celled throughout their existence, the latter are only so at the beginning, the cell colonies subsequently developing from the single primitive egg-cell (oeum) being transformed by cleavage into a globular mass of cells (morula), which first becomes a hollow vesicle and then changes into the gastrula. The simplest multicellular animal he conceived to resemble this gastrula with its two primary layers, ectoderm and endoderm, and the earliest hypothetical form of this kind, from which the higher animals might be supposed to be actually descended, he called the “gastraea.” This theory was first put forward in the memoir on the calcareous sponges, which in its sub-title was described as an attempt at an analytical solution of the problem of the origin of species, and was subsequently elaborated in various Studies on the Gastraea Theory (1873–1884). Haeckel, again, was the first to attempt to draw up a genealogical tree (Stammbaum) exhibiting the relationship between the various orders of animals
HAEMATITE—HAEMATOCELE

with regard to both one another and their common origin. His earliest attempt in the General Morphology was succeeded by many others, and his efforts in this direction may perhaps be held to culminate in the paper he read before the fourth International Zoological Congress, held at Cambridge in 1866, when he traced the descent of the human race in twenty-six stages from organisms like the still existing Monera, simple structureless masses of protoplasm, and the unicellular Protista, through the chimpanszees and the Pithecanthropus erectus, of which a few fossil bones were discovered in Java in 1894, and which he held to be undoubtedly an intermediate form connecting primitive man with the anthropoid apes.

Net content with the study of the doctrine of evolution in its zoological aspects, Haeckel also applied it to some of the oldest problems of philosophy and religion. What he termed the integration of his views on these subjects he published under the title of Die Weltrötel (1869), which in 1901 appeared in English as The Riddle of the Universe. In this book, adopting an uncompromising monistic attitude, he asserted the essential unity of organic and inorganic nature. According to his "carbon-theory," which has been far from achieving general acceptance, the chemo-physical properties of carbon in its complex aluminoid compounds are the sole and the mechanical cause of the specific phenomena of movement which distinguish organic from inorganic substances, and the first development of living protoplasm, as seen in the Monera, arises from such nitrogenous carbon-compounds by a process of spontaneous generation. Psychology he regarded as merely a branch of physiology, and psychical activity as a group of vital phenomena which depend solely on physiological actions and material changes taking place in the protoplasm of the organism in which it is manifested. Every living cell has psychic properties, and the psychic life of multicellular organisms is the sum-total of the psychic functions of the cells of which they are composed. Moreover, just as the highest animals have been evolved from the simplest forms of life, so the highest faculties of the human mind have been evolved from the soul of the brute-beasts, and more remotely from the simple cell-soul of the unicellular Protozoa. As a consequence of these views Haeckel was led to deny the immortality of the soul, the freedom of the will, and the existence of a personal God.

Haeckel's literary output was enormous, and at the time of the celebration of his sixtieth birthday at Jena in 1894 he had produced 42 works with 13,000 pages, besides numerous scientific memoirs. In addition to the works already mentioned, he wrote Freie Wissenschaft und freie Lehre (1877) in reply to a spoof in which Virchow objected to the teaching of the doctrine of evolution in schools, on the ground that it was an unproved hypothesis; Die systematische Phylogenie (1894), which has been pronounced his best book; Anthropogenie (1874, 5th and enlarged edition 1903), dealing with the evolution of man; Über unsere gegenwärtige Kenntnis vom Ursprung des Menschen (1898, translated into English as The Last Link, 1898); Der Kampf um den Entwicklungsgedanken (1905, English version, Last Words on Evolution, 1906); Die Lebenswunder (1904), a supplement to the Riddle of the Universe; books of travel, such as Indische Reisen (1902) and Wanderer, a record of journeys to Ceylon and to Java; Kunstformen der Natur (1904), with plates representing beautiful marine animal forms; and Wanderbilder (1905), reproductions of his oil-paintings and water-colour landscapes.

There are biographies by W. Bölsche (Dresden, 1900, translated into English by Joseph McCabe, with additions, London, 1906) and by Breitenbach (Odenkirchen, 1904). See also Walther May, Ernst Haeckel; Versuch einer Chronik seines Lebens und Werksens (Leipzig, 1900).

HAEMATITE, or HEMATITE, a mineral consisting of ferric oxide (Fe₂O₃), named from the Greek word ἁματίτης, "blood," in allusion to its typical colour, whence it is called also red iron ore. When crystallized, however, haematite often presents a dark colour, even iron-black; but on scratching the surface, the powder of the streak shows the colour of dried blood. Haematite crystallizes in the rhombohedral system, and is isomorphous with corundum (Al₂O₃). The habit of the crystals may be rhombohedral, pyramidal or tabular, rarely prismatic. In fig. 1 the crystal, from Elba, shows a combination of the fundamental rhombohedron (R), an obtuse rhombohedron (r), and the hexagonal bitetrahedron (a). Fig. 2 is a tabular crystal in which the basal pinacoid (v) predominates. Haematite has a distinct cleavage, but may show, in consequence of a lamellar structure, a tendency to parting along certain planes.

Crystallized haematite, such as that from the iron-mines of Elba, presents a steel-grey or iron-black colour, with a brilliant metallic lustre, sometimes beautifully iridescent. The splendent surface has suggested for this mineral such names as specular iron ore, looking-glass ore, and iron glance (for oligastie of French writers). The hardness of the crystallized haematite is about 6, and the specific gravity 5·2. The so-called "iron roses" (Eisenrosen) of Switzerland are rosette-like aggregates of hexagonal tabular crystals, from fissures in the gneissose rocks of the Alps. specular iron ore occurs in the form of brilliant metallic scales on many lavas, as at Vesuvius and Etna, in the Auvergne and the Icel, and notably in the Island of Ascension, where the mineral forms beautiful tabular crystals. It seems to be a sublimation-product formed in volcanoes by the interaction of the vapour of ferric chloride and steam.

Specular haematite forms a constituent of certain schistose rocks, such as the Brazilian itabirite. In the Marquette district of Michigan (Lake Superior) schistose specular ore occurs in important deposits, associated with a jasper rock, in which the ore alternates with bands of red quartzite. Micaeous iron ore consists of delicate steel-grey scales of specular haematite, incrustuous to the touch, used as a lubricant and also as a pigment. It is worked in Devonshire under the name of shining ore. Very thin laminae of haematite, blood-red by transmitted light, occur as microscopic enclosures in certain minerals, such as carnallite and sun-stone, to which they impart colour and lustre.

Much haematite occurs in a compact or massive form, often marmillary, and presenting on fracture a fibrous structure. The reniform masses are known as kidney ore. Such red ore is generally neither so dense nor so hard as the crystals. It often passes into an earthy form, termed soft red ore, and when mixed with more or less clay constitutes red ochre, ruddle or reddle (Ger. Rötel).

The hard haematite is occasionally cut and polished as an ornamental stone, and certain kinds have been made into beads simulating black pearls. It was worked by the Assyrians for their engraved cylinder-seals, and was used by the gnostics for amulets. Some of the native tribes in the Congo basin employ it as a material for axes. The hard fibrous ore of Cumberland is known as pencil ore, and is employed for the burnishers used by bookbinders and others. Santiago de Compostella in Spain furnishes masses of ore consisting of iron pyrites (FeS₂) and mica (Phlogopite) and carbonaceous burrishes of iron (Fe₂C). Haematite is an important ore of iron (p. e.), and is extensively worked in Elba, Spain (Bilbao), Scandinavia, the Lake Superior region and elsewhere. In England valuable deposits occur in the Carboniferous Limestone of west Cumberland (Whitehaven district) and north Lancashire (Ulverston district). The hard ore is siliceous, and fine crystallized specimens occur in association with smoky quartz. The ore is remarkably free from phosphorus, and is consequently valued for the production of pig-iron to be converted into Bessemer steel.

HAEMATOCELE (Gr. αἷμα, blood, and κυκός, tumour), the medical term for a localized collection of blood in the tunica vaginalis or cord. It is usually the result of a sudden blow or severe strain, but may arise from disease. At first it forms a smooth, fluctuating, opaque swelling, but later becomes hard and firm. In chronic cases the walls of the tunica vaginalis...
HAEMOPHILIA—HAEMORRHOIDS

undergo changes. The treatment of a case seen soon after the injury is directed towards keeping the patient at rest, elevating the parts, and applying an evaporating lotion or ice-bag. In chronic cases it may be necessary to lay open the cavity and remove the coagulum.

HAEMOPHILIA, the medical term for a condition of the vascular system, often running in families, the members of which are known as "bleeders," characterized by a disposition towards bleeding, whether with or without the provocation of an injury to the tissue. When this bleeding is spontaneous it comes from the mucous membranes, especially from the nose, but also from the mouth, bowel and bronchial tubes. Slight bruises are apt to be followed by extravasations of blood into the tissues; the swollen joints (knee specially) of a bleeder are probably due, in the first instance, to the escape of blood into the joint cavity or synovial membrane. It is always from the smallest vessels that the blood escapes, and may do so in such quantities as to cause death in a few hours.

HAEMORRHAGE (Gr. αἷμα, blood, and ἁπειρον, to burst), a general term for any escape of blood from a blood-veesel (see Blood). It commonly results from injury, as the tearing or cutting of a blood-veesel, but certain forms result from disease, as in scurvy and purpura. The chief varieties of haemorrhage are arterial, venous and capillary. Bleeding from an artery is of a bright red colour, and escapes from the end of the vessel nearest the heart in jets synchronous with the heart's beat. Bleeding from a vein is of a darker colour; the flow is steady, and the bleeding is from the distal end of the vessel. Capillary bleeding is a general oozing from a raw surface. By extravasation of blood is meant the pouring out of blood into the areolar tissues, which become boggy. This is termed a bruise or ecchymosis. Epistaxis is a term given to bleeding from the nose. Haematemesis is vomiting of blood, the colour of which may be altered by digestion, as is also the case in melena, or passage of blood with the faeces, in which the blood becomes dark and tarry-looking from the action of the intestinal fluids. Haemoptysis denotes an escape of blood from the air-passages, which is usually bright red and frothy from admixture with air. Haematuria means passage of blood with the urine.

Cessation of bleeding may take place from natural or from artificial means. Natural arrest of haemorrhage arises from (1) the coagulation of the blood itself, (2) the diminution of the heart's action as in fainting, (3) changes taking place in the cut vessel causing its retraction and contraction. In the surgical treatment of haemorrhage minor means of arresting bleeding are: cold, which is most valuable in general oozing and extravasations; very hot water, 150° to 160° F., a powerful haemostatic; position, such as elevation of the limb, valuable in bleeding from the extremities; styptics or astringents, applied locally, as perchloride of iron, tannic acid and others, the most valuable being suprarenal extract. In arresting haemorrhage temporarily the chief thing to do is press directly on the bleeding part. The pressure to be effectual need not be severe, but must be accurately applied. If the bleeding point cannot be reached, the pressure should be applied to the main artery between the bleeding point and the heart. In small blood-veesel pressure will be sufficient to arrest haemorrhage permanently. In large vessels it is usual to pass a ligature round the vessel and tie it with a reef-knot. Apply the ligature, if possible, at the bleeding point, tying both ends of the cut vessel. If this cannot be done, the main artery of the limb must be exposed by dissection at the most accessible point between the wound and the heart, and there ligature.

Haemorrhage has been classified as—(1) primary, occurring at the time of the injury; (2) reactionary, or within twenty-four hours of the accident, during the stage of reaction; (3) secondary, occurring at a later period and caused by faulty application of a ligature or septic condition of the wound. In severe haemorrhage, as from the division of a large artery, the patient may collapse before next day. In this case stimulants and strychnine may be given, but they should be avoided until it is certain the bleeding has been properly controlled, as they tend to increase it. Transfusion of blood directly from the vein of a healthy person to the blood-veesels of the patient, and infusion of saline solution into a vein, may be practised (see Shock). In a congenital condition known as haemophilia (q.v.) it is difficult to stop the flow of blood.

The surgical procedure for the treatment of an open wound is—(i) arrest of haemorrhage; (ii) cleansing of the wound and removal of any foreign bodies; (iii) careful apposition of its edges and surfaces—the edges being best brought in contact by sutures of aseptic silk or catgut, the surfaces by carefully applied pressure; (iv) free drainage, if necessary, to prevent accumulation either of blood or serous effusion; (v) avoidance of sepsis; (vi) perfect rest of the part. These methods of treatment require to be modified for wounds in special situations and for those in which there is much contusion and laceration. When a special poison has entered the wound at the time of its infliction or at some subsequent date, it is necessary to provide against septic conditions of the wound itself and blood-poisoning of the general circulation.

HAEMORRHOIDS, or Hemorrhoids (from Gr. αἷμα, blood, and δόρος, to flow), commonly called piles, swellings formed by the dilatation of veins of the lowest part of the bowel, or of those just outside the margin of its aperture. The former, internal piles, are covered by mucous membrane; the latter, external piles, are just beneath the skin. As the veins of the lining of the bowel become dilated they form definite bulgings within the bowel, and, at last increasing in size, escape through the anus when a motion is being passed. Growing still larger, they may come down spontaneously when the individual is standing or walking, and they are apt to be a grave source of pain or annoyance. Eventually they may remain constantly protruded—nevertheless, they are still internal piles because they arise from the interior of the bowel. Though a pile is sometimes solitary, there are usually several of them. They are apt to become inflamed, and the inflammation is associated with heat, pain, discharge and general uneasiness; ulceration and bleeding are also common symptoms, hence the term "bleeding piles."

The external pile is covered by the thin dark-coloured skin of the anal margin. Severe pressure upon the large abdominal veins may retard the upward flow of blood to the heart and so give rise to piles; this is apt to happen in the case of disease of the liver, malignant and other tumours, and pregnancy. General weakness of the constitution or of the blood-veesels and habitual constipation may be predisposing causes of piles. The exciting cause may be vigorous straining at stool or exposure to damp, as from sitting on the wet ground. Piles are often merely a symptom and, in their treatment this fact should be kept in view; if the cause is removed the piles may disappear. But in some cases it may be impossible to remove the cause, as when a widely-spreading cancerous growth of the rectum, or of the interior of the perineum or abdomen, is blocking the upward flow of blood in the veins. Sometimes when a pile has been protruded, as during defaecation, it is tightly grasped by spasmodic contraction of the circular muscular fibres which guard the outlet of the bowel, and it then becomes swollen, engorged and extremely painful; the strangulation may be so severe that the blood in the vessels coagulates and the pile mortifies. This, indeed, is nature's attempt at curing a pile, but it is distressing, and, as a rule, it is not entirely successful.

The palliative treatment of piles consists in obtaining a daily and easy action of the bowels, in rest, cold bathing, astringent injections, lotions and ointments. The radical treatment consists in their removal by operation, but this should not be contemplated until palliative treatment has failed. The operation consists in drawing the pile well down, and strangling the vessels entering and leaving its base, either by a strong ligature tightly applied, by crushing, or by cautery. Before dealing with the pile the anus is vigorously dilated in order that the pile may be dealt with with greater precision, and also that the temporary paralysis of the sphincter muscle, which follows the stretching, may prevent the occurrence of painful and spasmodic contractions subsequently. The ligatures by which the base of the piles are strangulated
slough off with the pile in about ten days, and in about ten days more the individual is, as a rule, well enough to return to his work. If, for one reason or another, no operation is to be undertaken, and the piles are troublesome, relief may be afforded by warm sparging and by sitz-baths, the pile being gently dried afterwards by a piece of soft linen, smeared with vaseline, and carefully returned into the bowel. Under surgical advice, cocaine or morphia may be brought in contact with the tender parts, either in the form of lotion, suppository or ointment. In operating upon internal piles it is undesirable to remove all the external piles around the anus, lest the contraction of the circumferential scar should cause permanent narrowing of the orifice. If, as often happens, blood clots in the vein of an external pile, the small, hard, tender swelling may be treated with anodyne fomentations, or it may be rendered insensitvive by the ether spray and opened by a small incision, the clot being turned out.

**HAEMOSPORIDIA**, in zoology, an order of Ectospora, which although comparatively few in number and very inconspicuous in size and appearance, have of late years probably attracted greater attention and been more generally studied than any other Sporozoa; the reason being that they include the organisms well known as malarial parasites. In spite, however, of much and careful recent research—to a certain extent, rather, as comprising various parasites which remain, in some respects, the group of the Ectospora about which our knowledge is, for the time being, in the most unsatisfactory condition. Such important questions, indeed, as the scope and boundaries of the group, its exact origin and affinities, the rank and interclassification of the forms admittedly included in it, are answered quite differently by different workers. For example, one well-known Sporozoan authority (M. Lühe) has recently united the two groups, Haemosporidia and Haemollandiates, boldly into one, while others (e.g. Novy and McNeil) deny the formation of any group by the Trypanosomes. Again, the inclusion or exclusion of forms like *Piroplasma* and *Halteridium* is also the subject of much discussion. The present writer accepts here the view that the Haemosporidia are derived from Haemollandiates which have developed a gregariniform (Sporozoan) phase at the expense, largely or entirely, of the flagelliform one. The not inconsiderable differences met with among different types are capable of explanation on the ground that certain forms have advanced farther than others along this particular line of evolution. In other words, it is most probable that the Haemosporidia are to be regarded as a result of changes in parasites which remain, intermediate between, on the one side, a Flagellate, and on the other, a typical chlamydospore-forming Ectosporan parasite. While, however, it is easy enough sharply to separate off all Haemosporidia from other Ectospora, it is a very difficult matter to define their limits on the former side. Two principal criteria which a doubtful haemal parasite might very well be required to satisfy in order to be considered as a Haemosporidian rather than a Haemollandiate are (a) the occurrence of schizogony during the "corpuscular" phase in the Vertebrate host, and (b) the formation of many ("sporozoites") from the zygote; so long as these conditions were complied with, the present writer, at all events, would not feel he was countenancing any protozoological heresy in allowing for the possibility of a Flagellate (perhaps trypaniform) phase or features being present at some period or other in the life-cycle.\(^1\) To render this article complete, however, one or two well-known parasites, hitherto referred to this order, must also be mentioned, which, judged by the above (arbitrary) standard, are, it may be, on the Haemollandiate side of the dividing line (e.g. *Halteridium*, according to Schaudinn).

The chief characters which distinguish the Haemosporidia from other Ectospora are the following. They are invariably blood parasites, and for part or all of the trophic period come into intimate relation with the cellular elements in the blood. There is always an alternation of hosts and of generations, an Invertebrate being the definitive host, in which sexual conjugation is undergone and which is to be regarded as the primary one, a Vertebrate being the intermediate or secondary one. The invertebrate (trypaniform, others (e.g. schizogonous) are formed, the ultimate germ or sporozoites always being free in the oocyst, and not enclosed by sporocysts.

To Sir E. Ray Lankester is due the honour of discovering the first Haemosporidians, a discovery which did not take place until after most of the other kinds of Sporozoa were known. In 1871 this author described the parasite of the frog, which he later termed *Drepanidium ranarum*. The next discovery was the great and far-reaching one of Laveran, who in 1883 described all the characteristic phases of the malarial parasite which are met with in human blood. While regarding the organism as the cause of the disease, Laveran did not at once recognize its animal and Sporozoan nature, but considered it rather as a vegetable, and termed it *Oscillaria malariae*. As in the case of the Trypanosomes, we owe to Danilewsky (1883-1889) the first serious attempts to study the comparative anatomy and life-history of these parasites, from a zoological point of view. Danilewsky first named them Haemosporidia, and distinguished between *Haemocystozoa* and *Leucocytozoa*. To the brilliant researches of these and other investigators (e.g. Schaudinn) is due the realization of the essential part played by the mosquito in the life-cycle and transmission of the parasites; and to MacCallum belongs the credit of first observing the true sexual conjugation, in the case of a *Halteridium*. Since then, thanks to the labours of Argutinsky and Schaudinn, our knowledge of the malarial parasites has steadily increased. Until quite recently, however, very little was known about the Haemosporidia of cold-blooded Vertebrates; but in 1903 Siegel and Schaudinn demonstrated that the same rôle is performed in the tick, the larva of which is the same as that of a tick, and since then many new forms have been described.

The Haemosporidia are widely distributed and of very general occurrence among the chief classes of Vertebrates. Among Invertebrates they are apparently limited to blood-sucking insects, ticks and leeches.\(^1\) As already stated, the universal habitat of the parasites in the Vertebrate is the blood; as a result, of course, they are to be met with in the capillaries of practically all the important organs of the body; and it is to be noted that while certain phases (e.g. growing trophozoites, mature gametocytes) are found free in the blood, other stages (e.g. young gametocytes) occur in the internal organs, liver, kidneys, &c., where the circulation is sluggish. The relation of the parasites to the blood-cells varies greatly. Most attack, probably exclusively, the red blood corpuscles (haematids); a few, however, select the leucocytes, and are therefore known as Leucocytozoa. In the case of Mammalian and Avian forms (malarial parasites) Schaudinn and Argutinsky have shown that the trophic and schizogenic phases are not really endogobular but closely attached to the corpuscle, hollowing out a depression or space into which they nestle; the gametocytes, on the other hand, are actually intercellular. Forms parasitic in cold-blooded Vertebrates, on the contrary, are always, so far as is known, endogobular when in relation with the corpuscles; and the same is apparently the case with the Mammalian parasite, *Piroplasma*. Although in no instance so far described is the parasite actually intracellular (as certain Coccidia are), in one or two cases (e.g. *Karyolytus* of lizards and certain species of *Haemogregarina*) it reacts markedly upon the nucleus and soon causes its disintegration. While many Haemosporidia (e.g. *Paratrichomonas*, with the exception of *Halteridium*) remain in connexion with the same corpuscle throughout the whole period of growth and schizogony, the new merozoites first being set free from the broken-down cell, others (the Haemogregarina, which has been described from the walls of the blood-vessels of an Annelid.

---

1 A possible exception is a doubtful species of *Haemogregarina*, which has been described from the walls of the blood-vessels of an Annelid.
gregarines, broadly speaking, and also *Haleticium* leave one corpuscle after a short time, wander about free in the plasma, and then seek out another; and this may be repeated until the parasite is ready for schizogony, which generally occurs in the corpuscle.

As in the Trypanosomes (q.v.), normally—that is to say, when in an accustomed, tolerant host, and under natural conditions—Haemosporidia are non-pathogenic and do not give rise to any ill-effects in the animals harbouring them. When, however, the parasites gain an entry into the blood of man or other unadapted animals, they produce, as is well known, harmful and often very serious effects. There are three recognized types of malarial fever, each caused by a distinct form and characterized by the mode of manifestation. Two, the so-called benign fevers, are intermittent; namely, tertian and quartan fever. Another type of fever, more acute and more generally fatal, is that produced by forms belonging to the genus *Piroplasma*, in cattle, dogs, horses and other domestic animals in different regions of the globe; and recently Wilson and Chowning have stated that the "spotted fever of the Rockies" is a human piroplasmosis caused by *P. lombris*. The disease of cattle is known variously as Texas-fever, Tristeza, Red-water, Southern cattle-fever, &c. In this type of illness the endogenous multiplication of the parasites is very great and rapid, and brings about an enormous diminution in the number of healthy red corpuscles. Their sudden destruction results in the liberation of large quantities of haemoglobin in the plasma, which turns deep-red in colour; and hence haemoglobinuria, which occurs only rarely in malaria, is a constant symptom in piroplasmosis.

The parasite of pernicious malaria, here termed *Laverania malariae*, will serve very well as a type of the general life-cycle (fig. 1). Slight differences shown by the other malarial parasites (*Plasmodium*) will be mentioned in passing, but the main divergences which other Haemosporidians exhibit are best considered separately. With the bite of an infected mosquito, large numbers of merozoites are injected into the blood. They rapidly penetrate into the blood corpuscles, in which they appear as small irregular, more or less amoeboid trophozoites. A vacuole next arises in the cytoplasm, which increases greatly in size, and gives rise to the well-known, much discussed ring-form of the parasite, in which it resembles a signet-ring, the nucleus forming a little thickening to one side. Some authorities (e.g. Argutinsky) have regarded this structure as being really a greatly distended vesicular nucleus, and, to a large extent, indeed, an artifact, resulting from imperfect fixation; but Schaudinn considers it a true vacuole, and explains it on the ground of the rapid nutrition and growth. Later on this vacuole disappears, and the grains of pigment make their appearance. The trophozoite is now large and full-grown, and has become rounded and ready for schizogony. The nucleus of the schizont divides several times (more or less directly, less simple or multiform fission) to form a number of daughter-nuclei, which take up a regular position near the periphery. Around these the cytoplasm becomes segmented, giving rise to the well-known *corps en roseae*. Eventually the merozoites, in the form of little round uninuclear bodies, are liberated from the now broken-down corpuscle, leaving behind a certain amount of residual cytoplasm containing the pigment grains. Besides the difference in the time taken by the complete process of schizogony in the various species (see above), there are distinctions in the composition of the rosettes. Thus, in *Laverania*, the number of merozoites formed is very variable; in *Plasmodium vivax* (the tertian parasite) there are only few (9 to 12) merozoites, but in *P. malariae* (the quartan form) they are more numerous, from 12 to 24. The liberated merozoites proceed to infect fresh blood corpuscles and a new endogenous cycle is started.

After asexual multiplication has gone on for some time, sexual forms become developed. According to Schaudinn, the stimulus which determines the production of gametocytes instead of schizonts is the reaction of the host (at the height of a fever period) upon the parasites. A young trophozoite which is becoming a gametocyte is distinguished from one which gives rise to a schizont by its much slower rate of growth, and the absence of any vacuoles in its cytoplasm. The gametocytes themselves are characterized by their peculiar shape, like that of a sausage, whence they are very generally known as "crecents." Male and female gametocytes are distinguished (roughly) by the arrangement of the pigment-grains; in the former, they are fairly evenly scattered throughout the cytoplasm, but in the megamerozoites the pigment tends to be aggregated centrally, around the nucleus. As they become more numerous and may, in some species, the aspermatozoites take a crescentic form and assume that of an oval, and finally of a sphere. At the same time, they are set free from the remains of the blood corpuscle. The spherical stage is practically the limit of development in the Vertebrate host, although, sometimes, the nucleus of the microgametocyte may proceed to division. The "crecents" of the pernicious parasite afford a very important diagnostic difference from the gametocytes of both species of *Plasmodium*, which have the ordinary, rounded shape of the schizonts. In the case of the latter, points such as their slower growth, their less amoeboid character, and their size furnish important distinctions of detail.

When a gnat or mosquito sucks blood, all phases of the parasite in the peripheral circulation at that point may succeed in passing into the insect. If this occurs all trophic and schizogenic phases are forthwith digested, and the survival of the sexual phases depends entirely upon whether the insect is a gnat or mosquito. Only in the latter case can further development of the gametocytes go on; in other words, only the genus *Anopheles*, and not the genus *Culiseta*, furnishes specific hosts for the malarial parasites. This is a biological fact of considerable importance in the investigation of the geographical distribution of the disease. In the stomach of an *Anopheles*, the gametocytes quickly proceed to gamete-formation. The nucleus of the microgametocyte divides up, and the daughter-nuclei pass to the periphery. The surface of the body grows out into long, whip-like processes, of which there are usually 6 to 8 (probably the typical number is 8); each is very motile, in this respect strongly resembling a flagellum. This phase may also develop in drawn blood, which has, of course, become suddenly cooled by the exposure; and it seems evident that it is the change in temperature, from the warm to the cold-blooded host, which brings about the development of the actual sexual elements. Earlier observers regarded the phase just described as representing another parasite altogether, of a flagellate nature—whence the well-known term, *Polymius-form*; and even more recent workers, such as Labbé who connected it with the malarial parasite,
HAEMOSPORIDIA

failed to appreciate its true significance, and considered it rather as a degeneration-appearance. The micro-gametes soon liberate themselves from the residual cytoplasm of the parent and swim away in search of a megagamete; each is a very slender, wavy filament, composed largely of chromatic substance. The finer details of structure of the microgamete of a malarial parasite cannot be said, however, to be thoroughly known, and it is by no means impossible that its structure is really trypaniform, as, according to Schaudinn's great work, is the case with the merozoites and sporozoites.

The megagametocyte becomes a megagamete directly after a process of maturation, which consists in the expulsion of a certain amount of nuclear substance. The actual conjugation is quite similar to the process in Coccidia, and the resulting zygote perfectly homologous. In the present case, however, the zygote does not at once secrete an oocyst, with a thick resistant wall; on the contrary, it changes its shape, and becomes a markedly crescentiform and active, and is known for this reason as an ookinete. The ookinete passes through the epithelial layer of the stomach, the thinner and more pointed end leading the way, and comes to rest in the connective tissue forming the outer layer of the stomach-wall (fig. 2). Here it becomes rounded and cyst-like, and grows considerably; for only a thin, delicate cyst-membrane is secreted, which does not impede the absorption of nutrient. Meanwhile, the nucleus has divided into several, around each of which the cytoplasm becomes segmented. Each of these segments ('blastophores,' 'zoidophores') is entirely comparable to a sporoblast in the Coccidian oocyst, the chief difference being that it never forms a spore; moreover the segments or sporoblasts in the oocyst of a malarial parasite are irregular in shape and do not become completely separated from one another, but remain connected by thin cytoplasmic strands. Repeated multiplication of the sporoblast-nuclei next takes place, with the result that a great number of little nuclei are found all round the periphery. A corresponding number of fine cytoplasmic processes grow out from the surface, each carrying a nucleus with it, and in this manner a

failed to appreciate its true significance, and considered it rather as a degeneration-appearance. The micro-gametes soon liberate themselves from the residual cytoplasm of the parent and swim away in search of a megagamete; each is a very slender, wavy filament, composed largely of chromatic substance. The finer details of structure of the microgamete of a malarial parasite cannot be said, however, to be thoroughly known, and it is by no means impossible that its structure is really trypaniform, as, according to Schaudinn's great work, is the case with the merozoites and sporozoites.

The megagametocyte becomes a megagamete directly after a process of maturation, which consists in the expulsion of a certain amount of nuclear substance. The actual conjugation is quite similar to the process in Coccidia, and the resulting zygote perfectly homologous. In the present case, however, the zygote does not at once secrete an oocyst, with a thick resistant wall; on the contrary, it changes its shape, and becomes a markedly crescentiform and active, and is known for this reason as an ookinete. The ookinete passes through the epithelial layer of the stomach, the thinner and more pointed end leading the way, and comes to rest in the connective tissue forming the outer layer of the stomach-wall (fig. 2). the young trophozoites markedly resemble *Piroplasma* in their pyriform appearance, and a further point of agreement between the two forms is mentioned below. Lastly there is the Avian genus *Halleridium*, the trophozoites of which are characteristically bean-shaped or reniform. True Haemogregarines also differ in other slight points from *Haemamoebidae.* Thus the young endobalgal trophozoite does not exhibit a ring (vacular) phase, and the cytoplasm never contains, at any period, the characteristic melanin pigment above noted. In some species of *Haemogregarina* the parasite, while intracorpuscular, becomes surrounded by a delicate membrane, the cytozoon, on emerging upon a trophic, "free" period, the cytozoon is ruptured and left behind with the remains of the corpuscle. A very interesting cytological feature is the occurrence, in one or two Haemosporidia, of nuclear dimorphism, i.e. of a larger and smaller chromatic body, probably comparable to the trophic and kinetic nuclei of a Trypanosome, or of the "Leishman-Donovan bodies." Schaudinn was the first to notice this character, in *Piroplasma* spp., and his observation has since been confirmed by others. Moreover, Brumpt has also noticed nuclear dimorphism in the ookinete of a species of *Haemogregarina* in a leech (as the Invertebrate host)—a highly important observation.

As regards the life-history, the schizogonic (schizogonic) cycle is known in many cases. Sometimes schizogony takes the primitive form of simple binary (probably) longitudinal fission; this is the case in *Haemogregarina* (fig. 4), and also in the *Piroplasma* sp., which is referred to. From this result the pairs of individuals ("twins") so often found in the corpuscles. In addition, however, at any rate in *Piroplasma*, it is probable that multiple division (more allied to octo-sporogony) also takes place; such is the habit of Laveran, in *P. equi*, and the occurrence at times of four parasites in a corpuscle, arranged in a cruciform manner, is most likely to be thus explained. Labbé has described schizogony in *Halleridium*

---

**Fig. 3.—Haemogregarina bigemina**, Laveran, from the blood of bennies. (After Laveran, magnified about 150 diameters.)

*a.* The form of the parasite found free in the blood-plasma. *b.* Parasite within a blood-corpuscle, preparing for division; the nucleus has already divided. *c.* The parasite has divided into two rounded corpuscles, from which form the free parasite, as seen in *d.* and *e.* *f.* Nucleus of the blood-corpuscle. *g.* Nucleus of the parasite. The outline of the blood-corpuscle is indicated by a thick black line.

Note 1. This does not agree with one of the principal reasons on account of which authorities consider *Piroplasma* (*Leishmaniac*) distinct from other *Piroplasmata* (see *Trypanosomes*).

**Note 2.** It must not be forgotten that one species of *Halleridium* (*H. trypanomorphum S. nocturnae*) is said to have well-marked trypomiform characteristics, and is considered by some as the precursor of the Trypanosomes (q.v.), and therefore, to avoid repetition, are only alluded to here. Whether *H. donlevisky* also becomes trypomiform in certain phases, and how far it really should be included in the Trypanosomatidae requires further notice. **Note 3.** Chagas's description of a parasite in the leech, *Haemogregarina*, is referred to as a new species, but it is likely that this will be found to be one of the above-mentioned species—*H. equi*?
had worked) that the latter had been misled by Coccioid cysts and spores, which he took for those of Lankesterella. The gametony and sporogony of Haemogregarina stepanovi in the leech agree in essential particulars with the processes already described, and the organism is developed, apart from the sporozoites, which are developed in the salivary glands, where the motile oocystes finally come to rest, are extremely "sphirochaetiform," the full significance of this latter fact being, perhaps, not appreciated.

Christophers recently described some remarkable phases which he regarded as belonging to the cycle of Haemogregarina (genus Lamanillia) (Mammalia) (the Haemogregarines known) in a louse (Haematopinus). In a private communication, however, the author stated that he has probably mistaken phases in the development of an ordinary gregarine parasite in the louse for part of the life-cycle of this Haemogregarine.

An appellative parasite Piroplasma is the one about whose life-history our knowledge is most vague. Besides the typical and generally occurring forms, others have also been observed in the blood, but it is doubtful how far those are to be looked upon as normal; for instance, Bowhill and Le Doux have described, in various species, a phase in which a long, slender pseudopodial-like outgrowth is present, with a swelling at the distal end. It is, moreover, quite uncertain which are the sexual forms, comparable to gametocytes. Doefin regards large pear-shaped forms as to some extent similar (which becomes maturing); and Nocard and Motas have figured amoeboid, irregular forms, with the nucleus fragmented and possessing flagellum-like processes (unidentified). The latter is of course well known to be, in the case of all species, a tick; thus bovine piroplasmosis (P. bigemini) in America is convoyed by Rhipicephalus appendiculatus (Boophilus bovis), canine piroplasmosis (P. canis) in South Africa by Dermacentor reticulatus (D. leachi), and so on. The manner in which the infection is transmitted by the tick varies greatly. In some cases (e.g. P. bigemini and P. canis) only the generation subsequent to that which receives the infection (by feeding on an infected ox) can transmit it back again to another ox; in other words, true hereditary infection of the ova in the mother-tick is found to occur. The actual period in the life of the tick at which it can convey the infection apparently varies. On the other hand, in the case of East African cattle-fever, Theller found that hereditary infection does not occur, the same generation transmitting the parasite (P. ovini) at different periods of life. Little is certainly known regarding the phases of the parasite which are passed through in the tick. Lignières has observed a kind of multiple fission in the stomach, several very minute bodies, consisting mostly of chromatin, being formed, which may serve for endogenous reproduction. Koch has published an account of certain curious forms of P. bigemini, in which the body is produced into many stiff, ray-like processes, giving the appearance of a star; among these the nucleus takes place, and the mature zoite becomes rounded, perhaps transitional to the pear-shaped forms.

The classification and nomenclature of the Haemogregarina are in a very unsettled condition. For an account of the various systems and modifications hitherto adopted, the article of Minchin (see under SOROZOA: Bibliography) should be consulted. It is not clear whether the domains included in the case of "Haemamoebae" and the Haemogregarines is fundamentally similar in type, the chief reason for grouping them as distinct suborders has disappeared. It is most convenient to regard them as separate, but closer allied families, the Piroplasmodae ("Haemamoebae") and the Haemogregarinidae. The Piroplasmoda, on the other hand, constitute another family, which is better placed in a distinct order or sub-order. In addition there is another group, as already noted, two or three genera whose systematic position must be considered as quite uncertain. One is the well-known Halteridium of Labbé, parasitic in various birds; the type-species is H. danilewskyi (Gr. Zoology). The latter is the most developed of the blood-corpuscles (leucocytes), originally described in birds by Danilewsky under the name of Leucocytozoan, a form which has been recently observed in Mammals.

In conclusion, the chief members of the above-mentioned families may be enumerated. Fam. Piroplasmodae ("Haemamoebae")
Genus Haemamoeba, Gr. and Fel. (syn. Haemamoeba, Ross), for L. malariae, Gr. and Fel. (syn. L. s. Plasmodium, s. "Haemamoeba," &c. process s. immaculatum, &c.), the parasite of pernicious malaria. Genus Plasmodium, March, and Cell. (syn. "Haemamoeba") for P. vivax and P. malariae, the tertiary and quaternary parasites, respectively. There is also a form known in apes, P. Koch. Genus Haemoproiteus, Kruse (syn. Proteosoma), for H. danilewskyi (syn. Proteosoma grisei, Plasmodium, &c.), the character of which is best described by Danilewsky under the name of Leucocytozoan, a form which has been recently observed in Mammals. Recently, another form has been described, from reptiles, which Castellani and Willey have termed Haemocystidium simondi.

Remarks. — The distinguishing characters of the malarial parasites have been mentioned above. Some authorities would include Laverania in the genus Plasmodium, as differing only specifically from the other two forms. It has, moreover, been suggested by Sergent that all three are merely different phases of the same parasite, predominating at different seasons; this idea cannot be regarded, however, as in any way proved so far. From what is known of the morphological and mode of manifestation of these forms, the differences between Laverania and the two species of Plasmodium are considerably more pronounced than those between P. vivax and P. malariae; if the latter are to be considered as distinct species, the first-named is probably generally distinct. Lebe, it may be noted, in his recent comprehensive account of the Haematozoa, also takes this view. Lastly, whatever be the correct solution of the above problem, there is certainly not sufficient justification for including the Avian forms, H. danilewskyi, as also only a species of Plasmodium, which is done by some. Its different vertebrate habitat, and also the fact that its Insectarian definitive host is Culex and not Anophelus, differentiate it sharply from Laverania and Plasmodium.

Nucleus of the parasite.
The body of the parasite exceeds the blood-corpuscle in length, when adult, and is bent upon itself, like a U. A very great number of species are known, mostly from reptiles and fishes; among them may be mentioned H. elongatus (figs. 1-3), from Emiregus and Clituras, whose sexual-cycle in a leech has been worked out by Siegel (see above), H. delagei, from Raja, H. bigemina, from bleenines, and H. simondi, from soles. Recently one or two or Mammalian forms have been described: H. equi, from an Indian rat (Gerbillus), and H. jacuti, from the jerboa.

Genus Lankesterella, Labbé (syn. Drepandium, Lankester). The parasite is found in certain groups of small rodents; L. ramaran from Rana is the type-species; another, recently described by Fantham, is L. tritonis, from the newt.

Genus Karyolysis, Labbé. The parasite does not exceed the corpuscle in length; the forms included in this genus, moreover, although not actually intranuclear, have a marked karyolytic and disintegrating action upon the nucleus of the corpuscle. The type-species is the well-known K. laceratum, of lizards; another is K. Haemogregarinae, Eiperini, from Tropidonotus.

his version there in February 1526, with a preface disclaiming connexion with the Anabaptists. His relations with Zwingli were difficult; returning to Basel he published (July 18, 1526) his translation of Malachi, with Oetcolamadius's exposition, and with a preface reflecting on Zwingli. This he followed by a version of Isaiah, 28: 6-22. He next went to Strassburg, and was received by Wolfgang Capito. At Strassburg in the late autumn of 1526 he fell in with Hans Dengk or Denck, who collaborated with him in the production of his opus magnum, the translation of the Hebrew Prophets, *Alle Propheten nach hebräischer Sprach vertueischt*. The preface is dated Worms, 3 April 1527; and there are editions, Worms, 13 April 1527, folio; Augsburg, 22 June 1527, folio; Worms, 7 Sept. 1527, 16v.; and Augsburg, 1528, folio. It was the first Protestant version of the prophets in German, preceding Luther's by five years, and highly spoken of by him. Haetzter and Denck now entered on a propagandist mission from place to place, with some success, but of short duration. Denck died at Basel in November 1527. Haetzter was arrested at Constance in the summer of 1528. After long imprisonment and many examinations he was condemned on the 3rd of February 1529 to die by the sword, and the sentence was executed on the following day. His demeanour on the scaffold impressed impartial witnesses, Hans Zwick and Thomas Blaurer, who speak warmly of his fervour and courage. The Dutch Baptist Martyrology describes him as a man of his own sweet pleasure. The historian Homo is said "he was condemned for the sake of divine truth." His papers included an unpublished treatise against the essential deity of Christ, which was suppressed by Zwingli; the only extant evidence of his anti-trinitarian views being contained in eight quarto lines of German verse preserved in Sebastian Frank's *Chronica*. The discovery of his heterodox Christology (which has led modern Unitarians to regard him as their proto-martyr) was followed by charges of loose living, never heard of in his lifetime, and destitute of evidence or probability.

See Breitinger, "Anecdota quaedam de L. H. "in Museum Helvetie, xxxvi. (1836), 353; Nietzsche, *Antitrinitarianismus* (1850); Dutch Martyrology (Hanserd Knollys Society) (1856); Th. Keim, in Hauck’s *Realencyclopädie*. (1899). (A. Gob.)

HAFIZ. Shams-ud-din Mahommed, better known by his *takhalli* or nom de plume of Hafiz, was one of the most celebrated writers of Persian lyrical poetry. He was born at Shiraz, the capital of Fars, in the early part of the 8th century of the Mahommedan era, that is to say, in the 14th of our own. The exact date of his birth is uncertain, but he attained a ripe old age and died in 701 A.H. (A.D. 1388). This is the date given in the chronogram which is engraved on his tomb, although several Persian biographers give a different year. Very little is actually known about his life, which appears to have been passed in retirement in Shiraz, of which he always speaks in terms of affectionate admiration. He was a subject of the Muzaifar princes, who ruled in Shiraz, Yazd, Kirman and Ispahan, until the dynasty was overthrown by Timur (Tamerlane). Of these princes his especial patrons were Shah Shuja‘ and Shah Mansur. He early devotted himself to the study of poetry and theology, and also became learned in mystic philosophy, which he studied under Shaik Mahmud ‘Attar, chief of an order of dervishes. Hafiz afterwards enrolled himself in the same order and became a professor of Koranic exegesis in a college which he and his patron Haji Kiwan-ud-din, the vizier, specially founded for him. This was probably the reason of his adopting the sobriquet of Hafiz ("one who remembers "), which is technically applied to any person who has learned the Koran by heart. The restraint of an ascetic life seem to have been very little to Hafiz's taste, and his loose conduct and wine-bibbing propensities led to his arrest and imprisonment at the instance of his patron, who was the invader Timur. The latter sent for him and asked angrily, "Art thou who was so bold as to offer my two great cities Samarkand and Bokhara for the black mole on thy mistress's cheek?" alluding to a well-known verse in one of his odes. "Yes, sire," replied Hafiz, "and it is by such acts of generosity that I have brought myself to such a state of destitution that I have now to solicit your bounty." Timur was so pleased at his ready wit that he dismissed the poet with a handsome present. Unfortunately for the truth of this story Timur did not capture Shiraz till A.D. 1533, while the latest date that can be assigned to Hafiz's death is 1391. Of his private life little or nothing is known. One of his poems is said to record the death of his wife, another that of a favourite unmarried son, and several others speak of his love for a girl called Shikh-i Nabat, "Sugar-cane branch," and this is almost all of his personal history that can be gathered from his writings. He was, like most Persians, a Shi‘ite by religion, believing in the transmission of the office of Imam (head of the Moslem Church) in the family of Ali, cousin of the prophet, and rejecting the Hadith (traditional sayings and acts) of Mahomet. Of his *masha"irs* or collections of his verses, the best known is *Akbarey-com al-awlaq* (completed 1511). Of the four great mystics of Persia, besides Hafiz, Husrav and Khayyam, the most popular is Hafiz. His works were greatly admired by his contemporaries, but the text of his poetry published in the early 19th century is corrupt and incomplete. He was, however, well known in his own time, and his fame spread through all classes of Persian society. He was a poet laureate and court poet to the great conqueror Timur, and his fame was equal to his name. He was as well known in the flower of Persia as is Byron in England. His works were translated into many languages and are still read in Persia and India. His poetry is characterized by a rich and refined style, marked by a deep sentiment and a high idealism. He was the first Persian poet to adopt the *kha‘igah* or *quatrain* as the usual form of Persian poetry, and he is said to have written 20,000 of these. Hafiz's poetry is characterized by a profound mysticism, and his theme is the love of God and the exaltation of the spirit. His language is pure and elevated, and his style is distinctive and original. His poetry is deeply influenced by the Sufi mysticism of Persia, and his works are filled with the love of God and the beauty of the world. His poems are full of imagery and symbolism, and his language is rich in allusions to the sacred books of Islam. His poetry is a perfect embodiment of the spirit of the Sufi mysticism, and his works are a perfect example of the Persian love of beauty and the expression of love for God. His poetry is deeply influenced by the Sufi mysticism of Persia, and his works are filled with the love of God and the beauty of the world. His poems are full of imagery and symbolism, and his language is rich in allusions to the sacred books of Islam. His poetry is a perfect embodiment of the spirit of the Sufi mysticism, and his works are a perfect example of the Persian love of beauty and the expression of love for God.
of a fervent soul and a lofty genius delighting in nature and enjoying life; and it is the poet's misfortune that he lived in an age and amongst a people where rigid conventionalism demanded that his free and spontaneous thoughts should be recast in an artificial mould.

Besides the Divan, Hafiz wrote a number of other poems; the Leiden collection contains about seventy ghazals (for the Divan, 42 ku'fis or fragments, 69 ruba'iyat or tetrastichs, 6 ma'nazvand poems in rhyming couplets, 2 kasdids, idyls or panegyrics, and 1 muhallam or poem in five strophes). The other editions are all bound or printed in volumes.

The whole Divan was translated into English prose by W. Wilberforce Clarke in 1831, with introduction and exhaustive commentary and bibliography; a few of the poems have been translated by W. J. H. Nott, J. Hindley, Falconer, etc., to be found scattered through the pages of the Oriental Miscellany and other periodicals, and a fine edition containing a verse rendering of the principal poems by W. B. Blackett in 1849, by S. Robinson (1857), A. Rogers (1889), J. H. M'Carthy (1893), and Gertrude L. Bell (1897).

The principal German versions are by von Hammer Purgstall (1812), which gave the first impulse to Goethe's Westöstlicher Divan; a rhyming and rhythmical translation of a large portion of Hafiz's works by Vincenz von Rosenzweig von Vienna (Vienna, 1858), which contains also the Persian text and notes; Der Divan des Schems-edin Muhammad Hafiz, by G. H. F. Nesselmann (Berlin, 1869), in which the rhyming system of the original is imitated. Besides these, the reader may consult d'Herbodel, Bibliothèque orientale, article "Hafiz"; and Weil, "Lettres de Hafiz." A Specimen of Persian Poetry, or Odes of Hafiz, by John Richardson (London, 1802); Biographische Notices of Persian Poets, by Sir Gore Ouseley ( Oriental Translation Fund, 1846); and an excellent article by Professor V. von Hagen in Monatsschrift für Indische Litteratur (No. 163, July 1854); A. J. VuUers, Vitae poetarum Persicorum (1839, translated from Daulatshah); and S. Robinson, Persian Poetry for English Readers (1883). The best edition of the text is perhaps that edited by Hermann Brockelmann of Leipzig (1834-1838), which is based on an abridgment of the Turkish edition, Sudi, and contains his commentary in Turkish on the first eight ghazals. Also H. Ethe in Grundriss der iranischen Philologie, ii. (Strassburg, 1896); P. Horn, Geschichte der persischen Literatur (Leipzig, 1901).

H. (1) Probably a shortened form of the O. Eng. hagelstone, hagtes, cognate with Ger. Hexe, witch, Dutch hecche), a word used during the 16th and 17th centuries for a female demon or evil spirit, and so particularly applied to such supernatural beings as the harpies and fairies of classical mythology, and also to witches. In modern usage the word is generally used of a hideous old woman whose repulsive exterior is accompanied by malice or wickedness. The name is also used of an edel-like parasitic fish, Myxine glutinosa, allied to the lamprey.

(2) A word common in Scottish and northern English dialects for wood. In the Scottish language, the same word as "hedge" (see HEDGES) and "haw." "Hag" also means "to cut," and is used in Scotland of an extent of woodland marked out for felling, and of a quantity of felled wood. This word is also used in the cutting of a peat of a "moss" or "bog," and hence applied to the small plots of firm ground or heather in a bog; it is common in the form "moss-hags."

HAGENDORN, FRIEDRICH VON (1708-1754), German poet, was born on the 23rd of April 1708 at Hamburg, where his father, a man of scientific and literary taste, was Danish minister. He was educated at the Gymnasium of Hamburg, and later (1726) became a student of law at Jena. Returning to Hamburg in 1729, he obtained the appointment of unpaid private secretary to the Danish ambassador in London, where he lived till 1731. Hagedorn's return to Hamburg was followed by a period of great poverty and hardship, but in 1733 he was appointed secretary to the so-called " English Court " (Englischer Hof) in Hamburg, a trading company founded in the 13th century. He shortly afterwards married, and from this time had sufficient leisure to pursue his literary occupations till his death on the 28th of October 1754. Hagedorn is the first German poet who bears unmistakable traces of the influence of Horace. He exerted a dominant influence on the German lyric until late in the 18th century.

The first collection of Hagedorn's poems was published at Hamb
erg in 1736, and after 1740, he issued a number of editions. Versuch einiger Gedichte (reprinted by A. Sauer, Heilbronn, 1883). In 1738 appeared Versuch in poetischen Fabeln und Erzählungen; in 1742 a collection of his lyric poems, under the title Sammlung von Gedichten, under the title of his day, and an additional collection of his entire works was published at Hamburg after his death in 1757. The best is J. J. Eschenburg's edition (5 vols., Berlin, 1849) of his poems, including his first volume of verse, published as a preliminary volume to an extensive edition in F. Muncker's Anthologie der prosaisch-patriotischen Lyriker (Stuttgart, 1894). See also H. Schuster, F. von Hagedorn und seine Bedeutung für die deutsche Literatur (Leipzig, 1882); W. H. Sauer, Hagen und die Erzählung in Reimsernw (Berlin, 1884).

HAGEN, FRIEDRICH HEINRICH VON DER (1780-1856), German philologist, chiefly distinguished for his researches in Old German literature, was born at Schmiedeberg in Brandenburg on the 10th of February 1780. After studying law at the university of Halle, he obtained a legal appointment in the state service at Berlin, but in 1806 resigned this office in order to devote himself exclusively to letters. In 1810 he was appointed professor extraordinarius of German literature in the university of Berlin; in the following year he was transferred in a similar capacity to Breslau, and in 1821 returned to Berlin as professor ordinarius. He died at Berlin on the 11th of June 1856. Although von der Hagen's critical work is now entirely out of date, the chief merit of awakening an interest in old German poetry belongs to him.

His principal publications are the Nibelungenlied, of which he issued four editions, the first in 1810 and the last in 1849; the Minnesinger (Leipzig, 1838-1853, in 4 vols., in 3 parts); Lieder der ältern Edda (Berlin, 1812); Gotfriid von Strassburg (Berlin, 1823); a collection of Old German tales under the title Gesammelte Abenteuer (Stuttgart, 1850, 3 vols.); and Das Heldenhoch (Leipzig, 1855). He also published Über die ältesten Darstellungen der Fassung (Berlin, 1844); and from 1835 he edited Das neue Jahrbuch der Berlinischen Gesellschaft für deutsche Sprache und Altertumskunde. His correspondence with C. Beyrich and G. F. Benecke was published by K. Dzialtzko (Leipzig, 1893).

HAGEN, a town of Germany, in the Prussian province of Westphalia. Pop. (1905), 77,408. It lies amid well-wooded hills at the confluence of the Ennepe with the Volme, 15 m. N.E. of Elberfeld, on the main line to Brunswick and Berlin, and at the junction of important lines of railway, connecting it with the principal towns of the Westphalian iron district. It has five Evangelical churches, a Roman Catholic church, an Old Catholic church, and a Greek church. The principal institutions are the Gymnasion, a technical school with special classes for machine-building. There are also a museum, a theatre, and a prettily arranged municipal park. Hagen is one of the most flourishing commercial towns in Westphalia, and possesses extensive iron and steel works, large cotton print works, woollen and cotton factories, manufactories of leather, paper, tobacco, iron and steel wares, breweries and distilleries. There are large limestone quarries in the vicinity and also an alabaster quarry.

HAGENAU, a town of Germany, in the imperial province of Alsace-Lorraine, situated in the middle of the Hagenaun Forest, on the river Hagenau, and on the railway from Strassbourg to Weissenburg, 10 m. N.N.E. of the former city. Pop. (1905), 18,500. It has two Evangelical and two ancient Catholic churches (one dating from the 12th, the other from the 13th century, a gymnasium, a public library, a hospital, and a theatre. The principal industries are wool and cotton spinning, and the manufacture of porcelain, earthenware, boots, soap, oil, sparkling wines and beer. There is also considerable trade in hops and vegetables. Hagenau is an important military centre and has a large garrison, including three artillery battalions. Hagenau dates from the beginning of the 12th century, and owes its origin to the erection of a hunting lodge by the dukes of Swabia. The emperor Frederick I surrounded it with walls and gave it town rights in 1154. On the site of the hunting lodge he founded an imperial palace, in which were preserved the jewelled imperial crown, sceptre, imperial globe, and sword of Charlemagne. Subsequently it became the seat of the Landvogt
of Hagenau, the imperial advocatus in Lower Alsace. Richard of Cornwall, king of the Romans, made it an imperial city in 1257. In 1548 it came into the possession of France, and in 1793 Louis XIV. caused the fortifications to be razed. In 1817 it was captured by imperial troops, but in 1817 it passed into the possession of the French, and in 1825 it fell, with the rest of Alsace-Lorraine, into the possession of Germany.

**HAGENBACH—HAGGAI**

HAGENBACH, KARL RUDOLF (1801–1874), German church historian, was born on the 4th of March 1801 at Basel, where his father was a practising physician. His preliminary education was received at a Pestalozzian school, and afterwards at the gymnasium, whence in due course he passed to the newly reorganized local university. He early devoted himself to theological studies and the service of the church, while at the same time cherishing and developing broad humanistic tendencies, expressed in many ways and especially in an enthusiastic admiration for the writings of Herder. The years 1820–1823 were spent first at Bonn, where G. C. F. Lücke (1791–1855) exerted a powerful influence on his thought, and afterwards at Berlin, where Schleiermacher and Neander became his masters. Returning in 1823 to Basel, where W. M. L. de Wette had recently been appointed to a theological chair, he distinguished himself greatly by his trial-dissertation, *Observationes historicorhemonemutiae circa Origenis methodum interpretandae sacrae Scripturarum*; in 1824 he became professor extraordinarius, and in 1829 professor ordinarius of theology. Apart from his academic labours in connexion with the history of dogma and of the church, he lived a life of great and varied usefulness as a theologian, a preacher and a citizen; and at his "jubilee" in 1873, not only the university and town of Basel but also the various churches of Switzerland united to do him honour. He died at Basel on the 7th of June 1874.

Hagenbach was a voluminous author in many departments, but he is specially distinguished as a writer on church history.

Though neither so learned and condensed as the contributions of Feilchenfeld, nor so original and profound as those of Neander, his lectures are clear, attractive and free from narrow sectarian prejudice. In dogmatics, while avowedly a champion of the "mediation theology" (*Vermittlungstheologie*), based upon the fundamental conceptions of Herder and Schleiermacher, he was much less revolutionary than were many others of his school. He sought to maintain the old confessional documents, and to make the objective prevail over the purely subjective manner of viewing theological questions. But he himself was aware that this was not always possible, and that his delineations of Christian dogma often betrayed a vacillating and uncertain hand.

His works include *Tabellarische Übersicht der Dogmengeschichte* (1828); *Encyclopädie u. Methodologie der theolog. Wissenschaften* (1833); Vorlesungen über Wesen u. Geschichte der Reformation u. des Protestantismus (1834–1843); *Lektüre der Dogmengeschichte* (1842; 2d ed., 1867; English transl., 1850); Vorlesungen über die Geschichte der alten Kirche (1833–1845); Vorlesungen über die Kirchengeschichte des Mittelalters (1860–1861); Grundlinien der Homiletik u. Liturgik (1862); *Biographien von Johannes Oeconomii (1482–1564) and Oswald Myconius (1488–1552)* and Geschichte der theolog. Schule Basel (1860); his Predigten (1858–1875), two volumes of poems entitled *Luther u. seine Zeit* (1858), and *Geschichte* (1846). The lectures on church history under the general title *Vorlesungen über die Kirchengeschichte von der ältesten Zeit bis zum 19ten Jahrhundert* were reissued in seven volumes (1868–1872).

See especially the article in Herzog-Hauck, *Realencyklopädie*.

**HAGENBECK—HAGGAI**

HAGENBECK, CARL (1844— ), wild-animal collector and dealer, was born at Hamburg in 1844. In 1845 his father purchased some seals and a Polar bear brought to Hamburg by a whaler, and subsequently acquired many other wild animals. At the age of 14, Carl Hagenbeck was given his first collection, and before long had greatly extended the business, so that in 1873 he had to erect large buildings in Hamburg to house his animals. In 1875 he began to exhibit a collection of the representative animals of many countries, accompanied by troupes of the natives of the respective countries, throughout all the large cities of Europe. The educational value of these exhibitions was officially recognized by the French government, which in 1851 awarded Hagenbeck the diploma of the Academy. Most of the wild animals exhibited in music-halls and other popular places of entertainment throughout the world have come from Hagenbeck's collection at Stellingen, near Hamburg. Hagerstown, a city and the county-seat of Washington county, Maryland, U.S.A., near Antietam Creek, about 86 m. by rail W. N. W. from Baltimore. Pop. (1890), 10,118; (1900), 13,591, of whom 1277 were negroes; (1910, census), 16,507. Hagerstown is served by the Baltimore & Ohio, the Western Maryland, the Norfolk & Western, and the Cumberland Valley railways, and by an interurban electric line. It lies in a fertile valley overlooked by South Mountain to the E. and North Mountain, more distant, to the W. The city is the seat of Kee Mar College (1852; non-sectarian) for women. Hagerstown is a business centre for the surrounding agricultural districts, has good water power, and as a manufacturing centre ranked third in the state in 1905, its factory products being valued in that year at $3,026,901, an increase of 66-3% over their value in 1900. Among the manufactures are flour, shirts, hosery, gloves, bicycles, automobiles, agricultural implements, print paper, fertilizers, sash, doors and blinds, furniture, carriages, spokes and wheels. The municipality owns and operates its electric lighting plant. Hagerstown was laid out as a town in 1763 by Captain Jonathan Hager (who had received a patent (1762) therefor) from Lord Baltimore; the city was incorporated in 1791. It was an important station on the old National (or Cumberland) Road. General R. E. Lee concentrated his forces at Hagerstown before the battle of Gettysburg.

HAG-FISH, GLUTINOUS HAG, or BORER (Myxine), a marine fish which forms with the lampreys one of the lowest orders of vertebrates ( Cyclostomata). Similar in form to a lamprey, it is usually found within the body of dead cod or haddock, on the flesh of which it feeds after having buried itself in the abdomen. When caught, it secretes a thick glutinous slime in such quantity that it is commonly believed to have the power of converting water into glue. It is found in the North Atlantic and other temperate seas of the globe, being taken in some localities in large numbers, e.g. off the east coast of Scotland and the west coast of California (see Cyclostomata).

**HAGGADA,** or 'AGADA (literally "narrative"), includes the more homiletic elements of rabbinic teaching. It is not logically distinguishable from the halakha (q. v.), for the latter or forensic element makes up the haggada the Midrash (q. v.), but, being more popular than the halakha, is often itself styled the Midrash. It may be described as the poetical and ethical element as contrasted with the legal element in the Talmud (q. v.), but the two elements are always closely connected. From one point of view the haggada, amplifying and developing the contents of Hebrew scripture in response to a popular religious need, may be termed a rabbinical commentary on the Old Testament, containing traditional stories and legends, sometimes amusing, sometimes trivial, and often beautiful. The haggada abounds in parables. The haggadic passages of the Talmud were collected in the *Eye of Jacob*, a very popular compilation completed by Jakob ibn Habib in the 16th century.

**HAGGAI,** in the Bible, the tenth in order of the "minor prophets," whose writings are preserved in the Old Testament. The name Haggai (Gr. Αγγελος, whence Aggeus in the English version of the Apocrypha) perhaps means "born on the feast day," "festive." But Wellhausen1 is probably right in taking the word as a contraction for Hagariah ("Yahweh hath girded"), just as Zaccai (Zachaeus) is known to be a contraction of Zachiyah.

1 In Bleek's *Einleitung*, 4th ed., p. 434.
old age. This supposition agrees well with the shortness of the period covered by his book, and with the fact that Zechariah, who began to prophesy in the same autumn and was associated with Haggai's labours (Ezra v. 1), afterwards appears as the leading prophet in Jerusalem (Zech. vii. 1-4). We know nothing further of the personal history of Haggai from the Bible. Later traditions may be read in Carpzov's *Introductio*, pars 3, cap. xvi. Epiphanius (*Vitae prophetarum*) says that he came up from Babylon while still young, prophesied the return, witnessed the building of the temple and received an honoured burial near the priests. Haggai's name is mentioned in the titles of several psalms in the Septuagint (Psalms xxxxvi., cxlv.-cxlviii.) and other versions, but these titles are without value, and moreover vary in MSS. Eusebius did not find them in the Hexaplar Septuagint.

In his first prophecy (i. 1-11) Haggai addresses Zerubbabel and Joshua, rebuking them for leaving the temple unbuilt while they are busy in providing panelled houses for themselves. The prevalent famine and distress are due to Yahweh's indignation at such remissness. Let them build the house, and Yahweh will take pleasure in it and acknowledge the honour paid to Him. The rebuke took effect, and the people began to work at the temple, strengthened by the prophet's assurance that the Lord was with them (i. 12-15). In a second prophecy (ii. 1-10) delivered in the following month, Haggai forbids the people to be distracted by thoughts of their former homes and empty houses, silver and gold are the Lord's. He will soon shake all nations and their choicest gifts will be brought to adorn His house. Its glory shall be greater than that of the former temple, and in this place He will give peace. A third prophecy (ii. 10-19) contains a promise, enforced by a figure drawn from the priestly ritual, that God will remove famine and bless the land from the day of the foundation of the temple onwards. Finally, in ii. 20-23, Zerubbabel is assured of God's special love and protection in the impending catastrophe of kingdoms and nations to which the temple was to be a light. Haggai's prophecies, indeed, may be regarded as the special prophecies of the theocratic importance of the house of David. In the book of Zechariah Zerubbabel has already fallen into the background and the high priest is the leading figure of the Judean community. The stem of David is superseded by the house of Zadok, the kingship has yielded to the priesthood, and the extinction of national hopes gives new importance to that strict organization of the hierarchy for which Ezekiel had prepared the way by his sentence of disfranchisement against the non-Zadokite priests.

The indifference of the Jews to the desolate conditions of their sanctuary opens up a problem of some difficulty. It is strange that neither Haggai nor his contemporary Zechariah mentions or implies any return of exiles from Babylon, and the suggestion has accordingly been made that the return under Cyrus described in Ezra i.-iv. is unhistorical, and that the community addressed by Haggai consisted of the remnant that had been left in Jerusalem and its neighbourhood after the majority had gone into exile or fled to Egypt (Jer. xxiii.). Such a remnant, amongst whom might be members of the priestly and royal families, would gather strength and boldness as the troubles of Babylon increased and her vigilance was relaxed, and might receive from Babylon and other lands both refugees and some account at least of the writings of Ezekiel and the Second Isaiah. Stipulated by such causes and obtaining formal permission from the Persian government, they would arise to a new Israel and enter on a new era of national life and divine revelation.

In spite, however, of the plausibility of this theory, it seems preferable to adhere to the story of Ezra i.-iv. Apart from the weighty objections that the Edomites would have frustrated such a recrudescence of the remnant Jews as has been described, it must be remembered that the main stream of Jewish life and thought had been diverted to Babylon. Thence, when the opportunity came under Cyrus, some 50,000 Jews, the spiritual heirs of the best elements of the old Israel, returned to found the new community. With them were all the resources, and the only people they found at Jerusalem were hostile gentiles and Samaritans. Full of enthusiasm, they set about rebuilding the temple and realizing the glowing promises about the prosperity and dominance of Zion that had fallen from the lips of the Second Isaiah (xlix. 14-26, xlv. 14). Bitter disappointment, however, soon overcame them, the Samaritans were strong enough to thwart and hinder their temple-building, and it seemed as though the divine favour was withdrawn. Apathy took the place of enthusiasm, and sourdied hopes succeeded to high hopes. The like collapse has often been experienced in history when national religious movements, as they thought, to freedom and the immediate erection of a holy commonwealth, have found their unity wrecked and their enthusiasm dissipated by a few inclement seasons on a barren and hostile shore.

From this torpor they were roused by tidings which might well be interpreted as the restoration of divine favour. Away in the East Cyrus had been succeeded in 529 B.C. by Cambyses, who had annexed Egypt and on whose death in 522 a Magian impostor, Gaumata, had seized the throne. The fraud was short-lived, and Darius I. became king and the founder of a new dynasty. The Persian Empire was divided among the Persian provinces and other subject states rose in revolt, and to the Jews it seemed that Persia was tottering and that the Messianic era was nigh. It was therefore natural that Haggai and Zechariah should urge the speedy building of the temple, in order that the great king might be fittingly received.

It is sometimes levied as a reproach against Haggai that he makes no direct reference to moral duties. But it is hardly fair to contrast his practical counsel with the more ethical and spiritual teaching of the earlier Hebrew prophets. One thing was needful—the temple. "Without a sanctuary Yahweh would have seemed a foreigner to Israel. The Jews would have thought that He had returned to Sinai, the holy mountain; and that they were deprived of the temporal blessings which were the gifts of a God who literally dwelt in the midst of his people." Haggai argued that material prosperity was conditioned by zeal in worship; the prevailing distress was an indication of divine anger due to the people's religious apathy. Haggai's reproofs touched the conscience of the Jews, and the book of Zechariah enables us in some measure to follow the course of a religious revival which, starting with the restoration of the temple, did not confine itself to matters of ceremony and ritual worship. On the other hand, Haggai's treatment of his theme, practical and effective as it was for the purpose in hand, moves on a far lower level than the aspirations of the prophet who wrote the closing chapters of Isaiah. To the latter the material temple is no more than a detail in the picture of a work of restoration eminently ideal and spiritual, and he expressly warns his hearers against attaching intrinsic importance to it (Isa. lxvi. 1). To Haggai the temple appears so essential that he teaches that while it lay waste, the exiles who were permitted to return. Zechariah's prophecy is fulfilled (Hag. ii. 14). In this he betrays his affinity with Ezekiel, who taught that it is by the possession of the sanctuary that Israel is sanctified (Ezek. xxxvii. 28). In truth the new movement of religious thought and feeling which started from the fall of the Hebrew state took two distinct lines, of which Ezekiel and the anonymous

2 After the foundation of the temple Zerubbabel disappears from history. His name is mentioned, however, in the apocryphal book of Enoch (cf. Dernbourg, *Haut. de la Palestine*, chap. i.).

3 *G. A. Smith,Minor Prophets*, ii. 235.
authors of Isa. xl.-lv. are the respective representatives. While the latter developed their great picture of Israel the mediatorial nation, the systematic and priestly mind of Ezekiel had shaped a more material conception of the religious vocation of Israel in that picture of the new theocracy where the temple and its ritual occupy the largest place, with a sanctity which is set in express contrast to the older conception of the holiness of the God of Israel. The city of Jerusalem (cf. Ezek. xiii. 7 seq. with Jer. xxxii. 40, Isa. iv. 5), and with a supreme significance for the religious life of the people which is expressed in the figure of the living waters issuing from under the threshold of the house (Ezek. xlvii.), was the conception of Ezekiel which permanently influenced the citizens of the new Jerusalem, and took final shape in the institutions of Ezra. To this consummation, with its necessary accomplishment in the extinction of prophecy, the book of Haggai already points.

AUTHORITIES.—The elaborate and valuable German commentary of A. Köhler (Erlangen, 1860) forms the first part of his work on the 

NACHESCHLITIENEN Propheten. Rellack’s Commentary (Münster, 1869) is the work of a scholarly Roman Catholic. Haggai has generally been treated in works on all the prophets, e.g. by Ewald (2nd ed. 1868; Eng. trans., vol. iii., 1879); or along with the other minor prophets, as by Hitzig (3rd ed., by H. Steiner, Leipzig, 1881), Keil (1866, 3rd ed., 1888, Eng. trans., Edinburgh, 1868), and Pusey in the City of Jerusalem (1880), W. W. Skeat, ed. (1904), J. Wellhausen (3rd ed. 1895); or with the other post-exilic prophets, as by Köhler, Pressel (Gottha, 1879), Dods (1879) and others. The older literature will be found in books of introduction or in commentaries. The learned commentary of G. F. Wright, who has been specially mentioned. On the place of Haggai in the history of Old Testament prophecy, see Duhm, Theologie der Propheten (Bonn, 1908), and waving the First and Third Theories of the Prophet. The A. F. Kirkpatrick, The Doctrine of the Prophets; G. A. Smith, The Book of the Twelve Prophets, vol. 2 (1903); Tony Andrè, Le Prophète Aggée; Ed. Meyer, Entstehung des Judentums (1896).

HAGGARD, HENRY RIDER (1856-1915), English novelist, was born at Bradenham Hall, Norfolk, on the 22nd of June 1856. When he was nineteen he went to South Africa as secretary to Sir Henry Bulwer, governor of Natal. At the time of the first annexation of the Transvaal (1877), he was on the staff of the special commissioner, Sir Theophilus Shepstone; and he subsequently became a master of the high court of the Transvaal. He married in 1879 a Norfolk heiress, Miss Margiston, but returned to the Transvaal in time to witness its surrender to the Boers and the overthrow of the policy of his former chief. He returned to England and read for the bar, but soon took to literary work; he published Ceyxawayo and his White Neighbours (1882), written in defence of Sir T. Shepstone’s policy. This was followed by the novels Dawn (1884), The Witch’s Head (1885), which contains an account of the British defeat at Isandhlwana; and in 1886 King Solomon’s Mines, suggested by the Zimbabwe ruins, which first made him popular. She (1887), another fantastic African story, was also very successful, a sequel, Ayesha, or the Return of She, being published in 1905. The scene of Jess (1887) and of Allan Quatermain (1888) was also laid in Africa. In 1895 he unsuccessfully contested the East Norfolk parliamentary division in the Unionist interest; he showed great interest in rural and agricultural questions, being a practical gardener and farmer on his estate in Norfolk. In his Rural England (2 vols., 1902) he exposed the evils of depopulation in country districts. In 1905 he was commissioned by the colonial office to inquire into the Salvation Army settlements at Fort Romey, S. California, and Fort Amity, Colorado, with a view to the establishment of similar colonies in South Africa. His report on the question was first published as a blue book, and afterwards, in an enlarged form, as The Plough and the Land (1905), with suggestions for a scheme of national land settlement in Great Britain itself.

His other books include Moïse’s Revenge (1888), Mr Meeson’s Will (1888), Colonel Quaritch, V.C. (1888), Cleopatra (1889). Eric Brighteyes (1890), The World’s Desire (1890, a romance of Helen of Troy, written with Mr Andrew Lang, No. 1 of the “Yellow Books”); The Daughter (1894), The People of the Mist (1894), Joan Haste (1895). Heart of the World (1896), Dr Thorne (1898), A Farmer’s Year (1899), The Cuckoo (1900), Lysistrata (1901), Stilla Fregielus (1903), A Gardener’s Year (1905), A Farmer’s Year (1899, revised ed., 1906), The Way of the Spirit (1906).

HAGGIS, a dish consisting of a calf’s, sheep’s or other animal’s heart, liver and lungs, and also sometimes of the smaller intestines, boiled in the stomach of the animal with seasoning of pepper, salt, onions, &c., chopped fine with suet and oatmeal. It is considered peculiarly a Scottish dish, but was common in England till the 18th century. The derivation of the word is obscure. The Fr. hagis, English “hash,” is of later appearance than “haggis.” It is probably connected with a verb “to hag,” meaning to cut in small pieces, and would then be cognate ultimately with “hush.”

HAGIOLOGY (from Gr. ἡγγίων, saint, ἱερός, discourse), that branch of the historical sciences which is concerned with the lives of the saints. If hagiology be considered merely in the sense in which the term has come to be understood in the later stages of its development, i.e. the critical study of hagiographic remains, there would be no such science before the 17th century. But there are several other bases of hagiology which may fairly be said to have been laid at the time when hagiographic documents, which are dispersed, were first brought together into collections. The oldest collection of this kind, the συναγωγὴ τῶν ἄγγελων μαρτυρίων of Eusebius, to which the author refers in several passages in his writings (Hist. Eccl., v. proem z; v. 20, 5), and which has left more than one trace in Christian literature, is unfortunately lost in its entirety. The Martyrs of Palestine, as also the writings of Theodoret, Paladius and others, on the origins of the monastic life, and, similarly, the Dialogues of St Gregory (Pope Gregory I.), belong to the category of sources rather than to that of hagiologic literature. The shorter collections such as the gnomologiai of Gregory of Tours are valuable for the sources used in their compilation. The most important collections are those which comprise the Acts of the Martyrs and the lives of saints, arranged in the order of the calendar. In the Greek Church these are called menologies (from Gr. μέλος, month, ἱερός, discourse), and their existence can be traced back with certainty to the 9th century (Theodore of Studium, Epist. i. 2). One of them, the menology of Metaphrases, compiled in the second half of the 10th century, enjoyed a universal vogue (see SYMMON META-

PHRASES). The corresponding works in the Western Church are the passionaries or legends, varieties of which exist in libraries and have not been studied collectively. They generally draw from a common source, the Roman legend, and the lives of the local saints, i.e. those specially honoured in a church, a province or a country. One of the best known is the Austrian legendary (De magno legendario Austriaco in the Analecta Bollandiana, xvii. 24-264). From the menologies and legends various compilations were made: in the Greek Church, the Synaxaria (see SYNAKARION); in the Western Church, the collection of extraordinary events such as the Speculum historiale of Vincent de Beauvais; the Legenda Auctorum of Dionysius of Corinth; the Sanctorale of Bernard Guy (J. 1331) (see L. Delisle, Notice sur les manuscrits de Bernard Guy, Paris, 1879); the Sanctorium of John of Tynemouth (c. 1360), utilized by John Capgrave, and published in 1516 under the name of Nova legenda Angliae (new edition by C. Horstman, Oxford, 1901); and the Catalogus sanctorum of Petrus de Natalibus (c. 1375), published at Vicenza in 1493, and many times reprinted. The works of B. Mombritis, published at Milan about 1485, is particularly valuable, as it gives a faithful reproduction of the ancient texts according to the manuscripts. One of the most zealous collectors of lives of saints was John Gielemans of Brabant (d. 1487), whose work is of great value (Bollandists, De codicibus hagiographicis Iohannis Gielemens, Brussels, 1895), and with him must be associated Anton Geens, or Gentius, of Groenendaal, who died in 1543 (Analecta Bollandiana, vi. 31-34).

Hagiology entered on a new development with the publication of the Sanctorum priscorum patrum vitae (Venice and Rome, 1531-1560) of Aloysius Lipomanno (Lipomano), bishop of Sorrento. At a result of the co-operation of the humanist scholars a great number of Greek hagiographic texts became for the first time accessible to the West in a Latin translation. The Carthusian, Laurentius Surius, carried on the work of Lipomano, completed it, and arranged the materials strictly in the order
of the calendar (De probatis sanctorum historiis, Cologne, 1570–1575). What prevents the work of Surius from being regarded as an improvement upon Lippomano’s is that Surius thought it necessary to retain the Pauline text of the documents which appeared to him badly written, without troubling himself about the consequent loss of their documentary value.

The actual founder of hagiologic criticism was the Flemish Jesuit, Heribert Rosweyde (d. 1620), who, besides his important works on the martyrologies (see MARTYROLOGY), published the celebrated collection of the Vitae pairum (Antwerp, 1615), a veritable masterpiece for the time at which it appeared. It was he, who conceived the plan of a great collection of lives of saints, compiled from the manuscripts and augmented with notable improvements, and based on the editorials of Surius (see BOLLANDISTS). This last enterprise gave rise to others of a similar character but less extensive in scope.

Dom T.’ Ruinart collected the best Acta of the martyrs in his Acta martyrum sincera (Paris, 1686). The various religious orders collected the Acta of their saints, often increasing the lists beyond measure. The best publication of this kind, the Acta sanctorum præsériis S. Benedicti (Paris, 1666–1701) of d’Achery and Mailllon, does not entirely escape this reproach. Countries, provinces and dioceses also had their special hagiographic collections, occasionally augmented, and a large number of books or collections on the lives of saints, or less hagiographic in character, were written. Of these, the most important collections are those of O. Caletanus, Vitæ sanctorum Siculorum (Palermo, 1657); G. Lobholt, Die Staatsheiligen des deutschen Reichs (Rome, 1723); H. Ghecquéire, Acta sanctorum Belgii (Brussels and Tongerlon, 1783–1794). The principal lives of the German saints are published in the Monumenta Germaniae, and a special section of the Scriptores rerum meritorum Germaniae.—The lives of the English and Ireland mention must be made of T. Mellingham’s Florilegium insulae sanctorum (Paris, 1624); I. Colgan’s Acta sanctorum veteris et novi testamenti seu Hiberniae (Louvain, 1645–1647); John Pinkerton’s Vitæ antiquæ sanctorum... (London, 1798, of a revised and enlarged edition was published by W. M. Murchat at Paisley in 1886, under the title of Lives of the Scottish Saints); W. J. Moore’s Lives of the Cumbrian-British Saints (Llandover, 1885); Acta sanctorum Hiberniae (Edinburgh, 1888); Whitley Stokes’s Lives of Saints from the Book of Lismore (Oxford, 1890); and J. O’Hanlon’s Lives of the Saints from the Book of Lismore. The English and Irish were published, for the 13th century vernacular collections of lives of saints began to increase. This literature is more interesting from the linguistic than from the hagiologic point of view, and comes rather within the domain of the philologist.

The hagiography of the Eastern and the Greek church also has been the subject of important publications. The Greek texts are very much scattered. Of them, however, may be mentioned J. B. Mair’s Acta sanctorum Graeciae (Patrologia Graeca, vol. 114, 115, 116) and Théophilos Ioannou, Μνημεία ἁγιογογία (Venice, 1884). For Syria, there are S. E. Assemani’s Acta sanctorum mariae et matris et laus victorium (Venice, 1746–1750); and Acta sanctorum (Paris, 1825–1847): for Armenia, the lives of martyrs and lives of saints, published in two volumes by the Mecitzarian community of Venice in 1747; for Copite, Hyvernat’s Les actes des saints martyres, ères des Gnostiques (Paris, 1740); and Conti Rossini’s Scriptores Aethiopici, vitæ sanctorum (Paris, 1901, seq.); and for Georgian, Sabinin’s Paradise of the Georgian Church (St. Petersburg, 1882).

In addition to the principal collections must be mentioned the innumerable works in which the hagiographic texts have been subject to detailed critical study.

To realize the present state of hagiology, the Bibliotheca hagiographica, both Latin and Greek, published by the Bollandists, and the Bulletins hagiographique, which appears in each number of the Analecta Bollandiana (see BOLLANDISTS), must be consulted. Thanks to the work of contemporary scholars, a great deal of hagiographic information has in recent years made notable progress. The criticism of the sources, the study of literary styles, and the knowledge of local history now render it easier to discriminate in this literature between what is really historical and what is merely the invention of the genius of the people or of the imagination of pious writers (see H. Delahaye, Les Légendes hagiographiques; 2nd ed., pp. 121–141, Brussels, 1906). ‘Though the lives of saints, says a recent historian, ‘are filled with miracles and incredible stories, they form a rich mine of information concerning the life and customs of the people. Some of them are memorials of the best men of their time, bringing the best sides of the time to light.’ (The Sources and Literature of English History, p. 34, London, 1900). (H. DE.)

HAGIOSCOPE—HAGUE, THE

(hgiosc, holy, and ἴαος, to see), in architecture, an opening through the wall of a church in an oblique direction, to enable the worshippers in the transepts or other parts of the church, from which the altar was not visible, to see the elevation of the Host. As a rule these hagioscopes, or ‘squints’ as they are sometimes called, are found on one or both sides of the chancel arch. In some cases a series of openings has been cut in the walls in an oblique line to enable a person standing in the porch (as in Bridgewater church, Somerset) to see the altar; in this case and in other instances such openings were sometimes provided for an attendant, who had to ring the Sanctus bell when the Host was elevated. Though rarely met with on the continent of Europe, there are occasions where they are found, so as to enable a monk in one of the vestries to follow the service and communicate with the bell-ringers.

HAGONY, a town of the province of Bulacan, Luzon, Philippine Islands, on Manila Bay and the W. branch of the Pasig river, 20 m. N.W. of Manila. Pop. (1903), 21,304. Hagony is situated in a rich agricultural region, producing rice, Indian corn, sugar and a little coffee. Alcohol is made in considerable quantities from the fermented juice of the nipal palm, which grows in the neighbouring swamps, and from the leaves of which the nipal thatch is manufactured. There is good fishing. The women of the town are very skilful in weaving the native fabrics. The language is Tagalog. Hagony was founded in 1581.

HAGUE, THE—Dutch, 's-Hertogenbosch, or, abbreviated, den Haag, Fr. La Hare, and in Late Lat. Haga Comititis, the chief town of the province of South Holland, about 25 m. from the sea, with a junction station 91 m. by rail S.W. by S. of Leiden. Steam tramways connect it with the seaside villages of Scheveningen, Kuykduin and 's Gravendize, as well as with Delft, Wassenaar and Leiden, and it is situated on a branch of the main canal from Rotterdam to Amsterdam. Pop. (1900), 212,211. The Hague is the chief town of the province, the usual residence of the court and diplomatic bodies, and the seat of the government, the states-general, the high council of the Netherlands, the council of state, the chamber of accounts and various other administrative bodies. The characteristics of the town are quite in keeping with its political position; it is as handsome as it is fashionable, and was rightly described by de Amicis in his Olanda as half Dutch, half French. The Hague has grown very largely in modern times, especially on its western side, which is situated on the higher and more sandy soil, the south-eastern half of the town comprising the poorer and business quarters. The main features in a plan of the town are its fine streets and houses and extensive avenues and well-paved squares, which lend to it the air of an attractive seaside resort, combined with the advantages and importance of a large town, and the possession of beautiful and wooded surroundings, give it a distinction all its own.

The medieval-looking group of government buildings situated in the Binnenhof (or ‘inner court’), their backs reflected in the pretty sheet of water called the Vvyp, represent both historically and topographically the centre of the Hague. On the opposite side of the Vvyp lies the parallelogram formed by the five houses and magnificent avenue of trees of the Lange Voorhout, the Kneuterdijk and the Vvyerburg, representing the fashionable kernel of the city. Close by lies the entrance to the Haagsche Bosch, or the wood, on one side of which is situated the deer-park, and a little beyond on the other the zoological gardens (1862). Away from the Lange Voorhout the fine Park Strait stretches to the ‘1813 Plein’ or square, in the centre of which rises the large monument (1866) by Jaquet commemorating the jubilee of the restoration of Dutch independence in 1813. Beyond this is the Alexander Veld, used as a military drill ground, and close by is the entrance to the beautiful road called the Scheveningenweg, which leads through the ‘lighthouse woods’ to Scheveningen. Parallel to the Park Strait is the busy Noord-einde, in which is situated the royal palace. The palace was purchased by the States in 1595, rebuilt by the stadtholder William III., and extended by King William I. in the beginning of the 19th century. In front of the building is an equestrian statue of William I. of Orange by Count Nieuwerkerke (1845), and behind are the gardens and extensive stables. The Binnenhof, which has been already mentioned, was once surrounded by
a moat, and is still entered through ancient gateways. The oldest portion was founded in 1240 by William II., count of Holland, whose son, Florens V., enlarged it and made it his residence. Several centuries later the stadtholders also lived here. The fine old hall of the knights, built by Florens, and now containing the archives of the office house, is the historic chamber in which the states of the Netherlands abjured their allegiance to Phillip II. of Spain, and in front of which the grey-headed statesman Johan van Oldenbarneveldt was executed in 1610. Close by on the one side are the courts of justice, and on the other the first and second chambers of the states-general, containing some richly painted ceilings and the portraits of various stadtholders. Government offices occupy the remainder of the buildings, and in the middle of the court is a fountain surmounted by a statue of William II., count of Holland (1227-1250). In the adjoining Buitenhof, or "outer court," is a statue of King William II. (d. 1849), and the old Gevangen Poort, or prison gate (restored 1875), consisting of a tower and gateway. It was here that the brothers Cornelis and Jan de Witt were killed by the mob in 1672. On the opposite side of the Binnenhof is the busy square called the Plein, where all the tram-lines meet. Round about it are the buildings of the ministry of justice and other government buildings, including one to contain the state archives, the large club-house of the Witte Societie, and the Mauritshuis. The Mauritshuis was built in 1633-1644 by Count John Maurice of Nassau, governor of Brazil, and contains the famous picture gallery of the Hague. The nucleus of this collection was formed by the princes of Orange, notably by the stadtholder William V. (1748-1806). King William I. did much to restore the losses caused by the removal of many of the pictures during the French occupation. Other artistic collections in the Hague are the municipal museum (Gerritsen Museum), containing paintings by both ancient and modern Dutch artists, and some antiquities; the fine collection of pictures in the Steenracht gallery, belonging to Jonkerhe Steenracht; the museum Meeremann-Westreenianum, named after Count Meeremann and Baron Westreenen (d. 1830), containing some interesting MSS. and specimens of early typography and other curiosities; and the Mesdag Museum, containing the collection of the painter H. W. Mesdag (b. 1831) presented by him to the state. The royal library (1798) contains upwards of 500,000 volumes, including some early illuminated MSS., a valuable collection of coins and medals and some fine antique gems. In addition to the royal palace already mentioned, there are the palaces of the crown-dowager, of the prince of Orange (founded about 1720 by Count Unico of Wassenaar-Twiekel) and of the prince of Wied, dating from 1825, and containing some good early Dutch and Flemish masters. There are numerous churches of various denominations in the Hague as well as an English church, a Russian church, a synagogue, and several Roman Catholic churches. The Groote Kerk of St James (15th and 16th centuries) has a fine vaulted interior, and contains some old stained glass, a carved wooden pulpit (1550), a large organ and interesting sepulchral monuments, and some escutcheons of the knights of the Golden Fleece, placed here after the chapter of 1456. The Nieuwe Kerk, or new church (17th century), contains the tombs of the brothers De Witt and of the philosopher Spinoza. Spinoza is further commemorated by a monument in front of the house in which he died in 1677. The picturesque town hall (built in 1565 and restored and enlarged in 1882) contains a historical picture gallery. The principal other buildings are the provincial government offices, the royal school of music, the college of art, the large building (1874) of the society for arts and sciences, the ethnographical institute of the Netherlands Indies with fine library, the theatres, civil and military hospitals, orphanage, lunatic asylum and other charitable institutions, the fine modern railway station (1892), the cavalry and artillery and the infantry barracks, and the cannon foundry. The chief industries of the town are iron casting, copper and lead smelting, cannon founding, the manufacture of furniture and carriages, liqueur distilling, lithographing and printing.

The Hague wood has been described as the city's finest ornament. It is composed chiefly of oaks and alders and magnificent avenues of gigantic beech-trees. Together with the Haarlem wood it is thought to be a remnant of the immense forest which once extended along the coast. At the end of one of the avenues which penetrates into it from the town is the large summer club-house of the Witte Societie, under whose auspices concerts are given here in summer. Further into the wood are some pretty little lakes, and the famous royal villa called the Huis ten Bosch, the summer residence of the stadtholder, Frederick Henry of Orange (d. 1647), and wings were added to it by Prince William IV. in 1748. The chief room is the Orange Saloon, an octagonal hall 50 ft. high, covered with paintings by Dutch and Flemish artists, chiefly of incidents in the life of Prince Frederick. In this room the International Peace Conference had its sittings in the summer of 1890. The collections in the Chinese and Japanese rooms, and the grisailles in the dining-room painted by Jacobus de Wit (1693-1754), are also noteworthy.

The history of the Hague is in some respects singular. In the 11th century it was no more than a hunting-lodge of the counts of Holland, and though Count Floris V. (b. 1254-1260) made it his residence and it thus became the seat of the supreme court of justice of Holland and the centre of the administration, and from the time of William of Orange onward the meeting-place of the states-general, it only received the status of a town, from King Louis Bonaparte, early in the 19th century.

In the latter part of the 17th and the first half of the 18th century the Hague was the centre of European diplomacy. Among the many treaties and conventions signed here may be mentioned the treaty of the Triple Alliance (January 23, 1688) between England, Sweden and the Netherlands; the concert of the Hague (March 31, 1710) between the Emperor, England and Holland, for the maintenance of the neutrality of the Swedish provinces in Germany during the war of the northern powers against Sweden; the Triple Alliance (January 4, 1717) between France, England and Holland for the guarantee of the treaty of Utrecht; the treaty of peace (Feb. 17, 1717) between Spain, Savoy and Austria, by which the first-named acceded to the principles of the Triple Alliance; the treaty of peace between Holland and France (May 16, 1795); the first "Hague Convention," the outcome of the "peace conference" assembled on the initiative of the emperor Nicholas II. of Russia (July 27, 1859), and the series of conventions, the results of the second peace conference (June 15-October 18, 1907). The international court of arbitration or Hague Tribunal was established in 1899 (see Europe: History; Arbitration, International). The Palace of Peace designed to be completed in 1913 as the seat of the tribunal, on the Scheveningen avenue, is by a French architect, L. M. Cordonnier, and A. Ripert, and its construction, which was begun in 1899, is to be completed in 1913.

HAHN, AUGUST (1792-1863), German Protestant theologian, was born on the 27th of March 1792 at Grossosterhausen near Eislen, and studied theology at the university of Leipzig. In 1819 he was nominated professor extraordinarius of theology and pastor of Altstadt in Königsberg, and in 1820 received a superintendency in that city. In 1822 he became professor ordinarius. In 1826 he removed as professor of theology to Leipzig, where, hitherto distinguished only as editor of Barthesan, Marcion (Marcion's Evangelium in seiner ursprünglichen Gestalt, 1823), and Ephraem Syrus, and the joint editor of a Syrische Christenhethke (1824), he came into great prominence as the author of a treatise, De rationalismi qui dictius vera et quae cum naturalismo continetur ratione (1827), and also of an Offene Erklärung an die Evangelische Kirche zunächst in Sachsen u. Preussen (1827), in which, as a member of the school of E. W. Hengstenberg, he endeavoured to convince the rationalists that it was their duty voluntarily and at once to withdraw from the national church. In 1833 Hahn's pamphlet against K. G. Bretschneider (Über die Lage des Christenthums in unserer Zeit, 1833) having attracted the notice of Friedrich Wilhelm III., he was called to Breslau as theological professor and consistorial councillor, and in 1834 became "general superintendent" of
Hahnemann—Haida

819

the province of Silesia. He died at Breslau on the 13th of May 1843. Though uncompromising in his "supra-naturalism," he did not altogether satisfy, in 1810 he published his chief work, Organum homoeopathicum. The first edition of his Lehrbuch des christlichen Glaubens (1828) was freely characterized as lacking in consistency and as detracting from the strength of the old positions in many important points. Many of these defects, however, he is considered to have remedied in his second edition (1857). Among his other works are his edition of the Hebrew Bible (1833), his Bibliothek der Symbole und Glaubensreden der apostolisch-katholischen Kirche (1842; 2nd ed. 1877) and Predigten (1852).

His eldest son, Heinrich August Hahn (1821–1861), after studying medicine at Breslau and Berlin, became successively Privatdozent at Breslau (1849), professor ad interim (1856) at Königsberg on the death of Heinrich Hänvernick, professor extraordinarius (1851) and professor ordinarius (1860) at Greifswald. Amongst his published works were a commentary on the Book of Job (1850), a translation of the Song of Songs (1852), an exposition of Isaiah xl-xlvi (1857) and a commentary on the Book of Ecclesiastes (1860).

See the articles in Herzog-Hauck, Realencyklopädie, and the Allgemeine deutsche Biographie.

Hahnemann, Samuel Christian Friedrich (1755–1843), German physician and founder of "homoeopathy," was born at Meissen in Saxony on the 10th of April 1755. He was educated at the "elector's school" of Meissen, and studied medicine at Leipzig and Vienna, taking the degree of M.D. at Erlangen in 1770. After practising in various places, he settled in Dresden in 1784, and thence removed to Leipzig in 1789. In the following year, while translating W. Cullen's Materia medica into German, he was struck by the fact that the symptoms produced by quinine on the healthy body were similar to those of the disordered states it was used to cure. He had previously felt dissatisfied with the state of the science of medicine, and this observation led him to assert the truth of the "law of similars," similia similibus curantur or curarent—i.e., diseases are cured (or should be treated) by those drugs which produce symptoms similar to those in the healthy. He promulgated his new principle in a paper published in 1796 in C. W. Hufeland's Journal, and four years later, convinced that drugs in much smaller doses than were generally employed effectually exerted their curative powers, he advanced his doctrine of their potentiates. He published a treatise in 1812 entitled Organum der rationalen Heilkunde, containing an exposition of his system, which he called homoeopathy (q.v.), and in the following years appeared the six volumes of his Reine Arzneimittellehre, which detailed the symptoms produced by "proving" a large number of drugs, i.e., by systematically administering them to healthy subjects. In 1821 the hostility of established interests, and especially of the apothecaries, whose services were not required under his system, forced him to leave Leipzig, and at the invitation of the grand-duke of Anhalt-Cöthen he went to live at Cöthen. Fourteen years later he removed to Paris, where he practised with great success until his death on the 2nd of July 1843. Statues were erected to his memory at Leipzig in 1851 and at Cöthen in 1855. He also wrote, in addition to the works already mentioned, Fragmenta de viribus medicamentorum positivis (1805) and Die chronischen Krankheiten (1828–1830).

See the article HOMOEOPATHY: also Albrecht, Hahnemann's Leben und Werke (Leipzig, 1875); Bradford, Hahnemann's Life and Labours (Philadelphia, 1890).

Hahn-Hahn, Ida, Countess von (1805–1895), German author, was born at Tressow, in Mecklenburg-Schwerin, on the 22nd of June 1805, daughter of Graf (Count) Karl Friedrich von Hahn (1782–1857), well known for his enthusiasm for the stage, upon which he squandered a large portion of his fortune. She married in 1826 her wealthy cousin Count Adolf von Hahn-Hahn. With him she had an extremely unhappy life, and in 1829 her husband's irregularities led to a divorce. The countess travelled, produced some volumes of poetry indicating true lyrical feeling, and in 1836 appeared as a novelist with Aus der Geschichte, a title which, proving equally applicable to her subsequent novels, was retained as that of one of which the book originally so entitled was renamed Ida Schönholz. For several years the countess continued to produce novels bearing a certain subjective resemblance to those of George Sand, but less hostile to social institutions, and dealing almost exclusively with aristocratic society. The author's patrician affectations at length drew upon her the merciless ridicule of Fanny Lewald in a parody of her style entitled Diogenes (1847), and this and the revolution of 1848 together seem to have co-operated in inducing her to embrace the Roman Catholic religion in 1850. She justified her step in a polemical work entitled Vom Babylon nach Jerusalem (1851), which elicited a vigorous reply from H. Abeken. In 1852 she retired into a convent at Angers, which she, however, soon left, taking up her residence at Mainz where she found a nursery, in which she lived without joining the order, and continued her literary labours. For many years her novels were the most popular works of fiction in aristocratic circles; many of her later publications, however, passed unnoticed as mere party manifestoes. Her earlier works do not deserve the neglect into which they have fallen. If their sentimentalism is somewhat tiresome, and their plots meagre, they are, nevertheless, produced on genuine feeling and experience; and with passionate eloquence Uhrich and Gräfin Faustine, both published in 1841, mark the culmination of her power; but Sigismund Forster (1843), Cecil (1844), Sibylle (1846) and Maria Regina (1850) also obtained considerable popularity. She died at Mainz on the 12th of January 1886.

Her collected works, Gesammelte Werke, with an introduction by O. von Schachting, were published in two series, 45 volumes in all (Regensburg, 1903–1904). S. H. Ritter, Gräfin Hahn-Hahn (Würzburg, undated); F. Haffner, Gräfin Ida Hahn-Hahn, eine psychologische Studie (Frankfort, 1880); A. Jacoby, Ida Gräfin Hahn-Hahn (Mains, 1894).

Hai (939–1038), a Jewish Talmudical scholar, was born in 939. He was convicted by his father Sherira, gaon of Pumbedita (Pumbedita), whom he afterwards assisted in his work. They were cast into prison for a short time by the caliph Qadir, and subsequently on Sherira's death Hai was appointed gaon in his place (908). This office he held till his death on the 28th of March 1038. He is famous chiefly for his answers to problems of ritual and civil law. He composed important treatises on Talmudic law and the Mishnah; many poems are also attributed to him on doubtful authority. In his responsa he laid stress on custom and tradition provided no infringement of the law was involved, and was able to set forth homoeopathic theories of medicine. He had considerable knowledge not only of religious movements within the Jewish body, but also of Mahomedan theology and controversial method, and frequently consulted theologians of other beliefs.

Hai, a town and khanate of Afghan Turkestan. The valley of Haihak, which is 3100 ft. above sea level, is fertile and richly cultivated. The town, which is famed in Persian legend, consists now of only a couple of streets, containing many Hindu shops and a small garrison. The inhabitants call themselves Jagatais, a Turki race, though now generally mixed with Tajiks and speaking Persian. In the neighbourhood of Haihak are some very typical Buddhist ruins. Haihak derives its importance from its position on the main line of communication between Kabul and Afghan Turkestan.

Haida, a tribe of North American Indians of Skattagatan stock. They still occupy their original home, the Queen Charlotte islands, British Columbia. They are skillful seamen, making long fishing expeditions in cedars with gillnets. They are noted for their carving and basket-work. They formerly made raids on the coast tribes. Slavery was hereditary, the slaves being prisoners of war. The population, some 7000 in the middle of the 19th century, is now reduced to a few hundreds.

HAIDER, WILHELM KARL, RITTER VON (1795-1871), Austrian mineralogist, geologist and physicist, was born at Vienna on the 5th of February 1795. His father, Karl Haidinger, contributed largely to the development of mineralogical science in the latter half of the 18th century. Having studied at the normal school of St Anne, and attended classes at the university, Wilhelm, at the age of seventeen, joined Professor F. Mohs at Gratz, and five years later accompanied the professor to Freiberg on the transfer of his labours to the mining academy of that town.

In 1822 Haidinger visited France and England with Count Brunner, and, journeying northward, took up his abode in Edinburgh. He translated into English, with additions of his own, Mohs's Grundriss der Mineralogie, published at Edinburgh in several volumes under the title Tableau sur Minéralogie (Leipzig, 1825). After a tour in northern Europe, including the Scandinavian mining districts, he undertook the scientific direction of the porcelain works at Elbigen, belonging to his brothers. In 1840 he was appointed counsellor of mines (Bergrat) at Vienna in the place of Professor Mohs, a post which included the charge of the imperial cabinet of minerals. He devoted himself to the re-arrangement and enrichment of the collections, and the museum became the first in Europe. Shortly after (1843) Haidinger commenced a series of lectures on mineralogy, which was given to the world under the title Handbuch der Münz- und Mineralogie (Vienna, 1845; tables, 1846). On the establishment of the imperial geological institute, he was chosen director (1849); and this important position he occupied for seventeen years. He was elected a member of the imperial board of agriculture and mines, and a member of the imperial academy of sciences of Vienna. He organized the society of the Freunde der Naturwissenschaften. As a physicist Haidinger ranked high, and he was one of the most active promoters of scientific progress in Austria. He was the discoverer of the interesting optical appearances which have been named after him, "Haidinger's brushes." Knighted in 1865, the following year he retired to his estate at Dornbach near Vienna, where he died on the 19th of March 1871.

In addition to the works already named, Haidinger published Anfangsgründe der Mineralogie (Leipzig, 1829); Geognostische Übersichtskarte der österreichischen Monarchie (Vienna, 1847; Bemerkungen über die Anordnung der kleinsten Theilchen in Christalliten (Vienna, 1853); Interferenzlinien am Glimmer (Vienna, 1856); Vergleichungen von Augit und Amphibol (Vienna, 1855). He also edited the Naturwissenschaftliche Abhandlungen (Vienna, 1847); the Berichte über die Mittheilungen von Freunden der Naturwissenschaften in Wien (Vienna, 1847-1851); and the Jahrbuch der vienna K. K. Geologische Reichsanstalt (1850), &c. Some of his papers will be found in the Transactions of the Royal Society of Edinburgh (vol. x.) and of the Wernerian Society (1822-1823), Edinburgh Phil. Journal, Brewer's Journal of Science, and Poggendorff's Annalen.

HAIĐUK (also written Heyduk, Heydüz, Heyduke and Heydעור), a term which appears originally to have meant "robber" or "brigand," a sense it retains in Servia and some other parts of the Balkan Peninsula. It is probably derived from the Turkish haidîd, "raider," but its origin is not absolutely certain. Most of the European races with which the Turks came into close contact during the 15th and 16th centuries seem to have adopted it as a loan-word, and it appears in Magyar as hajdú (plural hajdúk), in Serbo-Croatian, Romanian, Polish and Czeck as hajduk, in Bulgarian as haidin and in Greek as χαύρωρνης. By the beginning of the 17th century its use had spread north and west as far as Sweden and Great Britain. In Hungary it was applied to a class of mercenary foot-soldiers of Magyar stock. In 1603 these haidúks were rewarded for their fidelity to the Protestant party (see HUNGARY: History) with titles of nobility and territorial rights over a district situated on the left bank of the river Theiss, known thenceforward as the Haiduk region. This was enlarged in 1876 and converted into the county of Hajdú (Ger. Hajduken). Hajdú is also a common prefix in Hungarian place-names, e.g. Hajdú-Szoboszló, Hajdú-Námás. In Austria-Hungary, Germany, Poland, Sweden and some other countries, haiduk came to mean an attendant in a court of law, or a male servant, dressed in Hungarian semi-military costume. It is also occasionally used as a synonym for "footman" or "lackey."

HAIFA, a town of Palestine at the foot of Mt. Carmel, on the south of the Bay of Acre. It represents the classical Siccaminium, but the present town is entirely modern. It has developed since about 1850 into an important port, and is connected by railway with Damascus. The population is estimated at 12,000 (Moslems 6000, Christians 4000, Jews 5000, Germans 500; the last belong for the greater part to the Unitarian sect of the "Tempelars," who have colonies also at Jaffa and Jerusalem). The exports (grain and oil) were valued at £175,738 in 1900. Much of the trade that formerly went to Acre has been attracted to Haifa. This port is the best natural harbour on the Palestine coast.

HAIL (an Arabic word, from hak, to weave), a piece of cloth, usually of coarse hand-woven wool, worn by Arabs, Moors, and other Mahommedan peoples. It is generally 6 to 6½ yds. long, and about 2 broad. It is either striped or plain, and is worn equally by both sexes, usually as an outer covering; but it is often the only garment of the poorer classes. By women the "hail" is arranged to cover the head and, in the presence of men, is held so as to conceal the face. A thin "hāk" of silk, like a veil, is used by brides at their marriage.

HAILES, DALRYMPLE, LORD (1726-1792), Scottish lawyer and historian, was born at Edinburgh on the 28th of October 1726. His father, Sir James Dalrymple, Bart., of Hailes, in the county of Haddington, auditor-general of the exchequer of Scotland, was a grandson of James, first Viscount Stair; and his mother, Lady Christian Hamilton, was a daughter of Thomas, 6th earl of Haddington. David was the eldest of sixteen children. He was educated at Eton, and studied law at Utrecht, being intended for the Scottish bar, to which he was admitted shortly after his return to Scotland in 1748. As a pleader he attained neither high distinction nor very extensive practice, but he rapidly established a well-deserved reputation for sound knowledge, unwearied application and strict probity; and in 1766 he was elevated to the bench, when he assumed the title of Lord Hailes. Ten years later he was appointed a lord of justice. He died on the 29th of November 1792. He was twice married, and had a daughter by each wife. The baronetcy to which he had succeeded passed to the son of his brother John, provost of Edinburgh. Another brother was Alexander Dalrymple (1737-1788), the first admiral hydrographer, who distinguished himself in the East India Company's service and as a geographer. Lord Hailes's younger daughter married Sir
James Ferguson; and his grandson, Sir Charles Dalrymple, 1st Bart. (er. 1887), M.P. for Bute from 1868 to 1885, afterwards came into Lord Hailes’s estate and took his family name.

Lord Hailes’s most important contribution to literature was the *Annals of Scotland*, of which the first volume, “From the accession of Malcolm III., surnamed Canmore, to the accession of Robert I.,” appeared in 1776, and the second, “From the accession of Robert I., surnamed Bruce, to the accession of the house of Stewart,” in 1779. It is, as Dr Johnson justly described this work at the time of its appearance, a “Dictionary” of carefully sifted facts, which tells all that is wanted and all that is known, but without any laboured splendour of language or affected subtlety of conjecture. The other works of Lord Hailes include *Historical Memoirs concerning the Provincial Councils of the Scottish Clergy* (1766); *An Examination of some of the Arguments for the High Antiquity of Regiam Majestatem* (1766); three volumes entitled *Remains of Christian Antiquity* (Account of the Martyrs of Smyrna and Lyons in the Second Century,” 1776; The Trials of Justin Martyr, Cyprian, &c., 1778; “The History of the Martyrs of Palestine, translated from Eusebius,” 1780); *Disquisitions concerning the Antiquities of the Christian Church* (1783); and editions or translations of portions of Lactantius, Tertullian and Minucius Felix. In 1786 he published *An Inquiry into the Secondary Causes which Mr Gibbon has assigned for the Rapid Growth of Christianity* (Dutch translation, Utrecht, 1793), one of the most respectable of the very many replies which were made to the famous 15th and 16th chapters of the *Decline and Fall of the Roman Empire*.

A “Memoir” of Lord Hailes is prefixed to the 1800 reprint of his *Inquiry into the Secondary Causes*.

**HAILSHAM**, a market-town in the Eastbourne parliamentary division of Sussex, England, 54 m. S.S.E. from London by the London, Brighton & South Coast railway. Pop. (1901), 4107. The church of St Mary is Perpendicular. The picturesque Augustinian priory of Michelmah lies 2 m. W. by the Cuckmere river; it is altered into a dwelling house, but retains a gate-house, crypt and other portions of Early English date. There was also a Premonstratensian house at Oatham, 3 m. S., but the remains are scanty. Hailsham has a considerable agricultural trade, and manufactures of rope and matting are carried on.

**HAINAN**, or, as it is usually called in Chinese, *K’iung-chow-fu*, a large island belonging to the Chinese province of Kwang-tung, and situated between the Chinese Sea and the Gulf of Tong-kong from 20° 8’ to 17° 52’ N., and from 108° 32’ to 111° 15’ E. It measures 160 m. from N.E. to S.W., and the average breadth is about 90 m. The area is estimated at from 1200 to 1400 sq. m., or two-thirds the size of Sicily. From the peninsula of Lei-chow on the north it is separated by the straits of Hainan, which have a breadth of 15 or 20 m.

With a considerable area in the north, and broad tracts on the north-east and north-west sides, the whole island is occupied by jungle-covered mountains, with rich valleys between. The central range bears the name of Li-mou shan or Wu-tchi shan (the Five-Finger Mountain), and attains a height of 6000 or 7000 ft. Its praises are celebrated in a glowing ode by Ch’iu, a native poet. The island appears to be well watered, and some of its rivers are without importance as possible highways of commerce; but the details of its hydrography are very partially ascertained. A navigable channel extends in an irregular curve from the bay of Hoi-how (Hai-K’ow) in the north to Tan-chow on the west coast. Being washed by the western monsoon, the northern parts of the island enjoy much the same sort of temperate climate as the neighbouring provinces of the mainland, but in the southern parts, protected from the monsoon by the mountain ranges, the climate is almost or entirely tropical. Snow falls so rarely that its appearance in 1684 is reported in the native chronicles as a remarkable event. Earthquakes are a much more familiar phenomenon, having occurred, according to the same authority, in 1523, 1526, 1603, 1652, 1677, 1681, 1684, 1702, 1704, 1715, 1744, 1816, 1817 and 1821. Excellent timber of various kinds—cabbage-wood, rose-wood, Liquidambar, &c.—is one of the principal products of the island, and has even been specially transported to Peking for imperial purposes. The coco palm flourishes freely even in the north, and is to be found growing in clumps with the *Pinus sinensis*. Rice, cotton, sugar, indigo, cinnamon, betel-nuts, sweet potatoes, ground-nuts and tobacco are all cultivated in varying quantities. The aboriginal inhabitants collect a kind of tea called ‘tien cha,’ or celestial tea, which looks like the leaves of a wild camellia, and has an earthy taste when infused. Lead, silver, copper and iron occur in the Shi-lu shan or “stone-green-hill”; the silver at least was worked till 1850. Gold and lapis lazuli are found in other parts of the island.

The ordinary cattle of Hainan are apparently a cross between the little yellow cow of south China and the zebu of India. Buffalo are common, and in the neighbourhood of Nanlu at least they are frequently albinos. Horses are numerous but small. Hogs and deer are both common wild animals, and of the latter there are three species, *Cerus Eldi*, *Cerus hippocelaphus* and *Cerus vaginalis*. Among the birds, of which 172 species are described by Mr Swinhoe in his paper in *The Ibis* (1870), there are eagles, notably a new species *Spilornis Rutherfordi*, buzzards, harriers, kites, owls, goatsuckers and woodpeckers. The *Uinpere ceylonensis* is familiar to the natives as the “bird of the Li matrons,” and the *Palaearcous javanica* as the “sugar-cane bird.”

Hainan forms a fu or department of the province of Kwang-tung, though strictly it is only a portion of the island that is under Chinese administration, the remainder being still occupied by unsubjuncted aborigines. The department contains three *chow* and ten *hien* districts. K’iung-chow-hien, in which the capital is situated; Ting-an-hien, the only inland district; Wen-ch’i-hien, in the north-east of the island; Hsin-ch’i-hien, Lo-hui-hien, Ling-shu-hien, Wan-chow, Yai-chow (the southmost of all), Kan-en-hien Ch’ang-hwa-hien, Tan-chow, Lin-kao-hien and Ch’eng-mai-hien. The capital K’iung-chow-fu is situated in the north about 10 li (or 3 m.) from the coast on the river. It is a well-built compact city, and its temples and examination halls are in good preservation. Carved articles in coco-nuts and scented woods are its principal industrial product. In 1630 it was made the seat of a Roman Catholic mission by Benoit de Mathos, a Portuguese Jesuit, and the old cemetery still contains about 113 Christian names. The Port of K’iung-chow-fu at the mouth of the river, which is nearly dry at low water, is called simply Hoi-how, or in the court dialect Hai-K’ow, i.e. seaport. The two towns are united by a good road, along which a large traffic is maintained partly by coolie porters but more frequently by means of wheel-barrows, which serve the purpose of cabs and tarts. The value of the trade of the port has risen from 8670,600 in 1809 to 4719,333 in 1904. In the same year 424 vessels, representing a tonnage of 312,534, visited the port. This trade is almost entirely with the British colony of Hong-kong, with which port it is connected by small coasting steamers, but since 1893 it has had regular steamship communication with Haiphong in Tongking. The population of K’iung-chow, including its shipping port of Hoi-how, is estimated at 53,000. The number of foreign residents in 1900 was about 30, most of them officials or missionaries.

The inhabitants of Hainan may be divided into three classes, the Chinese immigrants, the civilized aborigines or Shu-li and the wild aborigines or Sheng-li. The Chinese were for the most part originally from Kwang-si and the neighbouring provinces, and they speak a peculiar dialect, of which a detailed account by Mr Swinhoe was given in *The Phoenix in the Wilderness of China*, &c. (1870). The Shu-li as described by Mr Taintor are almost of the same stature as the Chinese, but have a more decided copper colour, higher cheek-bones and more angular features, while their eyes are not oblique. Their hair is long, straight and black, and their beards, if they have any, are very scanty. They till the soil and bring rice, fuel, timber, grass-cloth, &c., to the Chinese markets. The Sheng-li or Li Proper, called also La, Le or Laury, are probably connected with the Laos of Siam and the Lolos of China. Though not gratuitously aggressive, they are highly intractable, and have given great trouble to the Chinese authorities. Among themselves they carry on
HAINAU—HAINICHEN

HAINAU, the younger, Reginald II., the countship of Hainaut, which remained in the male line of his descendants, all named
Reginal, until the death of Reginal V. in 1366. His heiress, Richildis, married en secondes noces Baldwin VI. of Flanders, and, by him, became the ancestress of the Baldwin (VI. of Hainaut) who in 1204 was raised by the Crusaders to the empire of the Holy Roman Empire. The Baldwin of Hainaut's elder daughter Jeanne brought the countship of Hainaut to her first husband Ferdinand of Portugal (d. 1233) and Thomas of Savoy (d. 1250). On her death in 1244, however, it passed to her sister Margaret, on whose death in 1270 it was inherited by her grandson, John of Avesnes, count of Holland (d. 1304). The countship of Hainaut remained united with that of Holland during the 14th and 15th centuries. It was under the counts William I. ("the Good") (1304–1337), whose daughter Philippa married Edward III. of England, and William II. (1337–1345) that the communes of Hainaut attained great political importance. Margaret, who succeeded her brother William II. in 1345, by her marriage with the emperor Louis IV. brought Hainaut with the rest of her dominions to the house of Wittelsbach. Finally, early in the 15th century, the countess Jacqueline was dispossessed by Philip the Good of Burgundy, and Hainaut henceforward shared the fate of the rest of the Netherlands.

AUTHORITIES.—The Chronicon Hanoniense or Chronicles Hannonisae of Gesclert of Mons (d. 1223–1225), chancellor of Count Baldwin V., covering the period 1215–1218, and the published version of his manuscripts, Monum. Germ. (Hanover, 1840, &c.). The Chronicon Hanoniense, ascribed to Baldwin, count of Avesnes (d. 1285), and written between 1275 and 1285 (xiv. 284), is the work of the famous antiquary Jacobus de Monum. Germ. Hannonisae, &c., at Antwerp (1601 and 1603) and Brussels (1722). The Annals of Jacques de Guise (b. 1334; d. 1399) were published by de Fortia d'Urban under the title, Histoire de Hainaut par Jacques de Guise, in 19 vols. (Paris, 1826), 4°; Delacour, "Bibliographie de l'his. du Hainaut," in the Annales du cercle archéologique de Mons, vol. v. (Mons, 1864); T. Bernier, Dioec. historica, &c., de Hainauti (Mons, 1891). See also Ulisse Chevalier, Répertoire des sources &c.

HAINBURG, or HAIMBERG, a town of Austria, in Lower Austria, 38 m. E.S.E. of Vienna by rail. Pop. (1900), 5134.

It is situated on the Danube, only 23 m. from the Hungarian frontier, and since the fire of 1827 Hainburg has been much improved, being now a handsomely built town. It has one of the largest tobacco manufactories in Austria, employing about 2000 hands, and a large needle factory. It occupies part of the site of the old Celtic town Carnuntum (q.v.). It is still surrounded by ancient walls, and from a gate guarded by two old towers. There are numerous Roman remains, among which may be mentioned the altar and tower at the town-house, on the latter of which is a statue, said to be of Attila. A Roman aqueduct is still used to bring water to the town. On the neighbouring Hainberg is an old castle, built of Roman remains, which appears in German tradition under the name of Heimbburg; it was wrested from the Hungarians in 1042 by the emperor Henry III. At the foot of the same hill is a castle of the 12th century, where Ottakar of Bohemia was married to Margaret of Austria in 1252; earlier it was the residence of the dukes of Babenberg. Outside the town, on an island in the Danube, is the ruined castle of Röthelstein or Rothenstein, held by the Knights Templars. Hainburg was besieged by the Hungarians in 1477, was captured by Matthias Corvinus in 1482, and was sacked and its inhabitants massacred by the Turks in 1683.

HAINICHEN, a town of Germany, in the kingdom of Saxony, on the Kleine Striegis, 15 m. N.E. of Chemnitz, on the railway to Rosswein. Pop. (1905), 7752. It has two Evangelical churches, a park, and commercial and technical schools. Hainichen is a place of considerable industry. Its chief manufactures are of flannels, baize, and similar fabrics; indeed it may be called the centre of this industry in Germany. The special whiteness and excellence of the flannel made in Hainichen are due to the peculiar nature of the water used in the manufacture. There are also large dye-works and bleaching establishments. Hainichen is the birthplace of Gellert, to whose memory a bronze statue was erected in the market-place in 1865. The Gellert Institution for the poor was erected in 1815.
HAI-PHONG—HAIR

HAI-PHONG, a seaport of Tongking, French Indo-China, on the 
Cua-Cam, a branch of the Song-koi (Red river) delta. The 
population numbers between 21,000 and 22,000, of whom 12,000 
are Annamese, 7,000 Chinese (attracted by the rice trade of the 
port) and 1,200 Europeans. It is situated about 20 m. from 
the Gulf of Tongking and 58 m. E. by S. of Hanoi, with which it 
communicates by river and canal and by railway. It is 
the second commercial port of French Indo-China, is a naval station, 
and has government and private ship-building yards. The 
harbour is accessible at all times to vessels drawing 19 to 30 ft., 
but is obstructed by a bar. Hai-phong is the seat of a resident 
who performs the functions of mayor, and the residency is the 
chief building of the town. A civil tribunal, a tribunal of com-
merce and a branch of the Bank of Indo-China are also among its 
institutions. It is the headquarters of the river steamboat 
service (Messageries fluviales) of Tongking, which plies as far 
as Lao-kay on the Song-koi, to the other chief towns of Tongking 
and northern Annam, and also to Hong-kong. Cotton-spinning 
and the manufacture of cement are carried on.

HAIR (a word common to Teutonic languages), the general 
term for the characteristic outgrowth of the epidermis forming 
the coat of mammals. The word is also applied by analogy to 
the filamentous outgrowths from the body of insects, &c., plants, 
and metaphorically to anything of like appearance.

For anatomy, &c. of animal hair see SKIN AND EXOSKELETON; 
FIBRES and allied articles; FUN, and LEATHER.

Anthropology.—The human hair has an important place 
among the physical characteristics of race. While its general structure 
and quantity vary comparatively little, its length in individuals 
and relatively in the two sexes, its form, its colour, its general 
consistency and the appearance under the microscope of its 
transverse section show persistent differences in the various races.
It is the persistence of these differences and specially in regard 
to its colour and texture, which has given to hair its ethnological 
importance. So obvious a racial differentiation had naturally long 
ago attracted the attention of anthropologists. But it was 
not until the 19th century that microscopic examination showed 
the profound difference in structure between the hair character-
istic of the great divisions of mankind. It was in 1863 that Dr 
Pruner-Bey read a paper before the Paris Anthropological 
Society entitled "On the Human Hair as a Race Character, 
examined by aid of the Microscope." This address established 
the importance of hair as a racial criterion. He demonstrated 
that the structure of the hair is threefold:

1. Short and crisp, generally termed "woolly," elliptical 
or kidney-shaped in section, with no distinguishable medulla or 

pitch. Its colour is almost always jet black, and it is character-
istic of all the black races except the Australians and aborigines 
of India. This type of hair has two varieties. When the hairs 
are relatively long and the spiral of the curls large, the head has 
the appearance of being completely covered, as with some of 
the Melanesian races and most of the negroes. Haeckel has 
called this "ericoenous" or "woolly" proper. In some negro 
peoples, however, such as the Hottentots and Bushmen, the hair 
grows in very short curls with narrow spirals and forms little 
tufts separated by spaces which appear bare. The head looks as 
if it were dotted over with pepper-seed, and thus this hair has 
gained the name of "peppercorn-growth." Haeckel has called it 
"lophoconous" or "crested." Most negroes have this type of 
hair in childhood and, even when fully grown, signs of it around 
the temples. The space between each tuft is not bald, as was at 
one time usually assumed. The hair grows uniformly over the 
head, as in all races.

2. Straight, lank, long and coarse, round or nearly so in section, 
with the medulla or pitch easily distinguishable, and almost 
without exception black. This is the hair of the yellow races, 
the Chinese, Mongols and Indians of the Americas.

3. Wavy and curly, or smooth and silky, oval in section, with 
medullary tube but no pitch. This is the hair of Europeans, 
and is mainly fair, though black, brown, red or towy varieties 
are found.

There is a fourth type of hair describable as "frizzy." It is 
easily distinguishable from the Asiatic and European types, but 
not from the negroid wool. It is always thick and black, and 
is characteristic of the Australians, Nubians, and certain of the 
Mulattos. Generally hair curls in proportion to its flatness. 
The rounder it is the stiffer and lanker. These extremes are 
respectively represented by the Papuans and the Japanese. 
Of all hair the woolly type is found to be the most persistent, 
as in the case of the Brazilian Caucazos, negro and native hybrids. 
Quatrefages quotes the case of a triple hybrid, "half negro, 
quarter Cherokee, quarter English," who had short crisp furry-
looking hair.

Wavy types of hair vary most in colour: almost the deepest 
hue of black being found side by side with the most flaxen and 
towy. Colour varies less in the lank type, and scarcely at all 
in the woolly. The only important exception to the uniform 
blackness of the negroid wool is to be found among the Wochus, 
a tribe of African pigmies whose hair is described by Wilhelm 
Junket (Travels in Africa, iii. p. 82) as "of a dark, rusty brown 
hue." Fair hair in all its shades is frequent among the popula-
tions of northern Europe, but much rarer in the south. According 
Dr John Beddow there are sixteen blacks out of every hundred 
Scotch, thirteen out of every hundred English, and two only out 
of a hundred Italians. The percentage of brown hair is 75% 
among Spaniards, 39 among French and 16 only in Scandinavia. 
Among the straight-haired races fair hair is far rarer; it is, 
however, found among the western Finns. Among those races 
with frizzy hair, red is almost as common as among those with 
woavy hair. Red hair, however, is an individual anomaly associ-
ated ordinarily with freckles. There are no red-haired races.

A certain correlation appears to exist between the nature of 
hair and its absolute or relative length in the two sexes. Thus 
straight hair is the longest (Chinese, Red Indians), while woolly 
is shortest. Wavy hair holds an intermediate position. In the 
two extremes the difference of length in man and woman is 
scarcely noticeable. In some lank-haired races, men's tresses 
are as long as women's, e.g. the Chinese pigtail, and the hair of 
Redskins which grows to the length sometimes of upwards of 
9 ft. In the frizzy-haired peoples, men and women have equally 
short growths. Bushwomen, the female Hottentots and negroes 
have hair no longer than men's. It is only in the wavy, and now 
and again in the frizzy types, that the difference in the sexes 
is marked. Among European men the length rarely exceeds 12 to 
16 in., while with women the mean length is between 25 and 
30 in. and in some cases has been known to reach 6 ft. or more.

The growth of hair on the body corresponds in general with 
that on the head. The hairiest races are the Australians and 
Tasmanians, whose heads are veritable mops in the thickness 
and unkept luxuriance of the locks. Next to them are the 
Todas, and other hill-tribesmen of India, and the Hairy Ainu 
of Japan. Traces, too, of the markedly hairy race, now extinct, 
supposed to be the ancestor of Toda and Ainu alike, are not 
found here and there in Europe, especially among the Russian 
peasantry. The least hairy peoples are the yellow races, the 
men often scarcely having rudimentary beards, e.g. Indians 
of America and the Mongols. Negr oid peoples may be said to 
be intermediate, but usually incline to hairlessness. The 
woavy-haired populations hold also an intermediate position, 
but somewhat incline to hairiness. Among negroes especially 
no rule can be formulated. Bare types such as the Bushmen and 
western negroes are found contiguous to hairy types such as 
the inhabitants of Ashante. Neither is there any rule as to baldness. 
From the anthropologic standpoint it would seem that it is 
otherwise less frequent among negroes than among whites between 
the ages of thirty-three and forty-five years, and thirty times less 
between twenty-one and thirty-two years. Among Mulattos it is 
more frequent than among negroes but less than among whites. It 
is rarer among Redskins than among negroes. The lanugo or 
downy hairs, with which the human foetus is covered for some 
time before birth and which is mostly shed in the womb, and the 
minute hairs which cover nearly every part of the adult human 
body, may be regarded as rudimentary remains of a complete 
hairy covering in the ancestors of mankind. The Pilocene, or
at all events Miocene precursor of man, was a furred creature. The discovery of Egyptian mummies six thousand years old or more has proved that this physical criterion remains unchanged, and that it is to-day what it was so many scores of centuries back. Perhaps, then, the primary divisions of mankind were distinguished by hair the same in texture and colour as that which characterizes to-day the great ethnical groups. The wavy type bridges the gulf between the lank and woolly types, all in turn derived from the hair-growers of the first race. In the Old Testament it is little noticed, as pointed out by P. Topinard, that though the regions occupied by the negro races are the habitat of the anthropoid apes, the hair of the latter is real hair, not wool. Further in the eastern section of the dark domain, while the Papuan is still black and dolichocephalic, his presumed progenitor, the orang-utan, is brachycephalic with decidedly red hair. Thus the white races are seen to come nearest the higher apes in this respect, yellow next, and black farthest removed.

No test has proved, on repeated examination, to be a safer one of racial purity than the quality of hair, and Pruner-Bey goes so far as to suggest that "a single hair presenting the average form characteristic of the race might serve to define it." At any rate a hair of an individual bears the stamp of his origin.

Commerce.—Hair enters into a considerable variety of manufactures. It is, for instance, the principal ingredient of haircloth and many other kinds of felt. It is employed for toilet and clothes-brushes, while inferior qualities are worked up into the commonest kinds of brushes used by painters and for many mechanical purposes. For artists' use and for decorative purposes, brushes or pencils of hair from the sable, camel, badger, polecat, &c., are prepared. The hair of various animals which is too short for spinning into yarn is utilized for the manufacture of felts. The hair of the rabbit, hare, beaver and of several of the other rodents is largely employed, especially in France, in making the finer qualities of felt hats. Cow hair, obtained from tanneries, is used in the preparation of roofing felts, and felt for covering boilers or steam-pipes, and for other similar purposes. It is also largely used by plasterers for binding the mortar of the walls and roofs of houses; and it is to some extent being woven up into coarse friezes, horse-cloths, railway rugs and Inferior blankets. The tail hair of oxen is also of value for stuffing cushions and other upholstery work, for which purpose, as well as for making the official wigs of law officers, barristers, &c., and the tail and body hair of the yak or dzo (Bos grunniens) is used very extensively. The tail hair of the horse is in great demand for various purposes. The long tail hair is especially valuable for weaving into hair-cloth, hair and the short tail hair being, on the other hand, principally prepared for the making of brushes. The hatters of the world are covered with the cloth manufactured from the long hair. The horse hair used in Great Britain is principally obtained from South America, Brazil and Russia, and its sorting, cleaning and working up into the various manufactures dependent on the material are industries of some importance. In addition to the purposes already alluded to, horse hair is woven into crinoline for ladies' bonnets, plaited into fishing lines, woven into bags for oil and grocery pressers, and into straining cloths for brewers, &c., and for numerous other minor uses. The manufactures which arise in connexion with human hair are more peculiar than important, although occasionally fashion may create a large demand for human hair. The fluctuations of such fashions determine the value of hair; but at all times long tresses are of considerable value. Grey, light, pale and auburn hair are distinguished as second-quality, and command much higher prices than the common shades. The light-coloured hair is chiefly obtained in Germany and Austria, and the south of France is the principal source of the darker shades. In the south of France the cultivation and sale of heads of hair by peasant girls is a common practice; and hawkers attend fairs for the special purpose of engaging in this traffic. Hair 5 and even 6 ft. long is sometimes obtained. Scarcely any of the "raw material" is obtained in the United Kingdom except that of the noble "ladies" of the Indian with a count of one in five or six. It may be acquired by means of peroxide of hydrogen is extensively practised, with the view of obtaining a supply of golden locks, or of preparing white hair. With the exception of grey and white hair, hair of any purity or extent is acquired by a system of procuring it in the Smithsonian Institution at Washington, in the country, and among the negroes. It is not of small size, and constitutes the backbone of Haiti; the southern curving first S.W., then N.W., and reaching the sea near St. Marc. In addition to these there are a number of secondary crests, difficult to trace to the backbone of the system, the largest being in the north, where there was probably no communication between the north. The St. Marc embayment is filled with a mass of myriads of brachiopods, which are doubtless the remains of an old continent, probably a large part of the lower Paleozoic era, and was then the region of a sea of low level, connected with the ocean by a strait, which is now filled up by the withdrawal of the water by the festivities. Such an occurrence is the cause of the great abundance of the shells of the sea, especially in the north. The absence of the shells of the sea in the south is explained by the fact that the sea-level has been raised and the water has been supplied by the rivers. The St. Marc embayment is filled with a mass of myriads of brachiopods, which are doubtless the remains of a great continent, probably a large part of the lower Paleozoic era, and was then the region of a sea of low level, connected with the ocean by a strait, which is now filled up by the withdrawal of the water by the festivities. Such an occurrence is the cause of the great abundance of the shells of the sea, especially in the north. The absence of the shells of the sea in the south is explained by the fact that the sea-level has been raised and the water has been supplied by the rivers.
elevation on the island, which rises as a spur N.W. of the city of Saint-Domingo. In the Sierra del Cibao, the highest summit is the Pico del Yaque (9700 ft.). The southern range runs from the Bay of Neyba due W. to Cape Tiburon. Its highest points are La Selle (6000 ft.) and Pico Placa (8000 ft.). It is the largest of the Haitian plains. It stretches eastwards from the river Ozama for 95 m. and has an average width of 16 m. It is perfectly level, abundantly watered, and admirably adapted for the large rivers of the Ozama, the Cibao, the Yaque del Norte, and the Royal Plain, as it was called by Columbus, which lies between the Cibao and Monti Cristi ranges. It stretches from Samana Bay to Manzanillo Bay, a distance of 450 m. of watertable, and for a depth of 400 ft., which rise the rivers which drain it. The northern part of this plain, however, is usually known as the Valley of Santiago. Most of the large valleys are in a state of nature, in process of formation, and unoccupied.

There are four large rivers. The Yauca, rising in the Pico del Yaque, falls after a tortuous north-westly course through the valley of Santiago, to Manzanillo Bay; its mouth is obstructed by reefs and islets. The Neyba, or South Yaque, also rises in the Pico del Yaque and flows S. into the Bay of Neyba. In the mountains within a few miles from the sources of these rivers, rise the Yuna and the Artibonite. The Yuna drains the Vega Real, flows into Samana Bay, and is navigable by light-draught vessels for some distance from its mouth. The Artibonite flows through the valley of its name into the Gulf of Gonave. Of the smaller rivers the Ozama and the Cibao, which drain the central and western parts of Haiti, is by far the most important. The greatest lake is that of Enriquillo or Xaragua, at a height of 300 ft. above sea-level. It is 27 m. long by 8 m. broad, consisting of two water-bodies, one of which was formed from a salt-water lake, and the other from a reservoir of rain water. Between the two, the common negroes call it Etang Salé. After heavy rains it occasionally forms a continuous sheet of water with another lake called Azuey, or Etang Saumatre, which is 16 m. long by 4 m. broad, and in which the unintermitted rains of the total height of Haiti and is larger than the Lake of Geneva. Farther S. is the Icoton de Limon, 5 m. long by 2 m. broad, a fresh-water lake with no visible outlet. Smaller lakes are the Aiguille. There are no active volcanoes, but earthquakes are not infrequent.

Geology.—The geology of Haiti is still very imperfectly known, and large tracts of the island have never been examined by a geologist. It is possible that the sites that have been observed in the central and eastern parts of the island may be of Pre-Cretaceous age, but the oldest rocks in which fossils have yet been found belong to the Cretaceous System, and the geological sequence is very similar to that of the neighboring British Island. In the north, however, the series begins with sandstones and conglomerates, containing pebbles of syenite, granite, diorite, &c.; and these are overlaid by marls, clays and limestones containing Hippurites. Then follows a series of sandstones, clays and limestones with occasional seams of lignite, evidently of shallow-water origin. These are referred to R. T. Hill to the Eocene, and they are succeeded by chalky beds which were laid down in a deeper sea and which probably correspond with the Montpelier beds of Jamaica (Oligocene). Finally, there are limestones and marls composed largely of corals and molluscs, which are probably of Tertiary and Post-Tertiary age. The island has been more thoroughly examined, the correlation of the various Tertiary and Post-Tertiary deposits must remain doubtful. Some of the beds which Hill has placed in the Eocene have been relegated to the Cretaceous, and to the Miocene, or to the Post-Miocene. Hauptenhauer describes extensive eruptions of basalt of Post-Pliocene age.

Fauna and Flora.—The fauna is not extensive. The agouti is the largest wild mammal. Birds are few, excepting water-fowl and parrots. Snakes abound, though few are venomous. Lizards are numerous, and insects swarm in the low parts, with tarantulas, scorpions and centipedes. Caymans are found in the lakes and rivers, and the waters teem with fish and other sea food. Wild cattle, hogs and dogs, descendants of those brought from Europe, roam large on the plains and in the forests. The wild hogs furnish much sport to the natives, who hunt them with dogs trained for the purpose.

In richness and variety of vegetable products Haiti is not excelled by any other country in the world. All tropical plants and trees grow naturally. The climate of the plains is very nearly equable, and therefore climates may be successfully cultivated in the highlands. Among indigenous products are cotton, rice, maize, tobacco, cocoa, ginger, native indigo (indigo marmor or savauge), arrowroot, manioc or casava, pimento, banana, plantain, rice apple, artichoke, yam and sweet potato. Among the important plants and fruits are sugar-cane, coffee, indigo (called indigo franc, to distinguish it from the native), melon, cabbage, lucerne, guineas grass and the breadfruit, mangosteen, papaya, pawpaw, jack fruit, figs, guava, and longan. Most of the imported fruits have degenerated from want of care, but the mango, now spread over nearly the whole island, has become a sort of native fruit, and of which the large-fruited and smooth-skinned varieties become common, but is not so much esteemed. Haiti is also rich in woods, especially in cabinet and dye woods; among the former are mahogany, manchineel, satinwood, rosewood, cinnamon wood (Cinnamomum verum), Canadian mahogany (Swietenia macrophylla), and the latter are Brazil wood, logwood, fustic and saussas. On the mountains are extensive forests of pine and a species of oak; and in various parts occur the locust, ironwood, cypress or Bermuda cedar, palmetto and many kinds of palms.

Climate.—Owing to the great diversity of its relief Haiti presents a wider range of climate than any other part of the Antilles. The export climate is usually mild, averaging about 72°, but the wet and dry seasons are clearly divided. At Port-au-Prince the rainy season lasts from April to October, but varies in other parts of the island. The winter temperature is high in the mountain districts, but moderate in the lowlands. The mountain districts are commonly bathed in dense mists and heavy dews, while other districts are almost rainless. Owing to its sheltered position the heat at Port-au-Prince is greater than elsewhere. In summer the temperature ranges between 80° and 95° F. and in winter between 70° and 85°. Even in the highlands the mercury never falls below 45° F. Hurricanes are not so frequent as in the Windward Isles, but violent gales often occur. The prevailing winds during the year are from NE.

The Republic of Haiti.—Haiti is divided into two parts, the negro republic of Haiti owning the western third of the island, while the remainder belongs to Santo Domingo (q.v.) or the Dominican Republic. Between these two governments there exists the strongest political antipathy.

Although but a small state, with an area of only 7,204 sq. m., the republic of Haiti is, in many respects, one of the most interesting communities in the world, as it is the earliest and most successful example of a state peopled, and governed on a color line. The negro is the one success story of the Western Hemisphere, being assisted by two chambers, the members of which are elected and hold office under a constitution of 1898. This constitution, thoroughly republican in form, is French in origin, as are also the laws, language, traditions and customs of Haiti. In practice, however, the government resolves itself into a military despotism, the power being concentrated in the hands of the president.

The Haitians seem to possess everything that a progressive and civilized nation can desire, but corruption is spread through every portion and branch of the government. Justice is venal, and the police brutal and inefficient. Since 1865 the Roman Catholic Church has been the state religion, but all classes of society seem to be permeated with a thinly disguised adherence to the horrid rites of Voodoo (q.v.), although this has been strenuously denied. The country is divided into 5 départements, 23 arrondissements and 67 communes. Each département and arrondissement is governed by a general in the army. The army numbers about 7000 men, and the navy consists of a few small vessels. Elementary education is free, and there are some 400 primary schools; secondary education is mainly in the hands of the church. The Sisters of Charity and the Christian Brothers have schools. The University of Haiti is at Port-au-Prince, and there is a law school. The children of the wealthier classes are usually sent to France for their education. The unit of money is the gourde, the nominal value of which is the same as the American dollar, but it is subject to great fluctuations. The revenue is almost entirely derived from customs, paid both on imports and exports. There being a lack of capital and enterprise, the excessive customs duties produce a very depressed condition of trade. Imports are consequently confined to bare necessities, the cheapest sorts of dry and fancy goods, matches, salt beef and pork, codfish, lard, butter and similar provisions. The exports are coffee, coco, logwood, cotton, gum, honey, tobacco and sugar. The island is one of the most fertile in the world, and if it had an enlightened and stable government, an energetic people, and a little capital, its agricultural possibilities would seem to be endless. Communications are bad; the roads constructed during the French occupation have degenerated into mere bridle tracks. There is a coast service of steamers, maintained since 1863, and 26 ports are regularly visited every ten days. Foreign communication is excellent, more foreign steamships visiting this island than any other in the West Indies. A railway from Port-au-Prince runs through the Plain of Cul de Sac for 28 m. to Manneville on the Etang Saumatre, another runs from Cap Haitien to La Grande Rivière, 75 m. distant.

The people are almost entirely pure-blooded negroes; the mulattoes, who form about 10% of the population, being a rapidly diminishing and much-hated class. The negroes are a kindly, hospitable people, but ignorant and lazy. They have
a passion for dancing weird African dances to the accompaniment of the tom-tom. Marriage is neither frequent nor legally prescribed, since children of looser unions are regarded by the state as legitimate. In the interior polygamy is frequent. The people generally speak a curious but not unattractive patois of French origin, known as Créole. French is the official language, and by a few of the educated natives it is written and spoken in its purity. On the whole it must be owned that, after a century of independence and self-government, the Haitian people have made no progress, if they have not actually shown signs of retrogression. The chief towns are Port-au-Prince (pop. 75,000), Cap Haitien (20,000), Les Cayes (25,000), Gonâve (18,000), and Port de Paix (10,000). Jeremie was the birthplace of the elder Dumas. The ruins of the wonderful palace of Sans-Souci and of the fortress of La Ferrière, built by King Henri Christophe (1807-1825), can be seen near Milot, a town 9 m. inland from Cap Haitien. Praisance (25,000), Gros Morne (22,000) and La Croix des Bouquets (20,000) are the largest towns in the interior. The entire population of the republic is about 1,500,000.

History.—The history of Haiti begins with its discovery by Columbus, who landed from Cuba at Môle St Nicholas on the 6th of December 1492. The natives called the country Haiti (mountainous country), and quisquisa (vast country). Columbus named it Española (Little Spain), which was latinized into Hispaniola. At the time of its discovery, the island was inhabited by about 2,000,000 Indians, who are described by the Spaniards as feeble in intellect and physically defective. They were, however, soon exterminated, and their place was supplied (as early as 1512) by slaves imported from Africa, the descendants of whom now possess the land. Six years after its discovery Columbus had explored the interior of the island, founded the present capital, and had established flourishing settlements at Isabella, Santiago, La Vega, Porto Plata and Bonao. Mines had been opened up, and advances made in agriculture. Sugar was introduced in 1506, and in a few years became the staple product. About 1630, a mixed company of French and English, driven by the Spaniards from St Kitts, settled on the island of Tortuga, where they became formidable under the name of Buccaneers. They soon obtained a footing on the mainland of Haiti, and by the treaty of Ryswick, 1697, the part they occupied was ceded to France. This new colony, named Saint Dominique, subsequently attained a high degree of prosperity, and was in a flourishing state when the French Revolution broke out in 1789. The population was then composed of whites, free coloured people (mostly mulattos) and negro slaves. The mulattos demanded civil rights, up to that time enjoyed only by the whites; and in 1791 the National Convention conferred on them all the privileges of French citizens. The whites at once adopted the most violent measures, and petitioned the home government to reverse the decree, which was accordingly revoked. In August 1791, the plantation slaves broke out into insurrection, and the mulattos threw in their lot with them. A period of turmoil followed, lasting for several years, during which both parties were responsible for acts of the most revolting cruelty. Commissioners were sent out from France with full powers to settle the dispute, but although in 1793 they proclaimed the abolition of slavery, they could effect nothing. To add further to the troubles of the colony, it was invaded by a British force, which, in spite of the climate and the disposition of the colonists, succeeded in maintaining itself until driven out in 1708 by Toussaint l'Ouverture. By treaty with Spain, in 1795, France had acquired the title to the entire island.

By 1801, Toussaint l'Ouverture, an accomplished negro of remarkable military genius, had succeeded in restoring order. He then published, subject to the approval of France, a form of constitutional government, under which he was to be governor for life. This step, however, roused the suspicions of Bonaparte, then first consul, who determined to reduce the colony and restore slavery. He sent out his brother-in-law, General Leclerc, with 25,000 troops; but the colonists offered a determined and ferocious resistance. At length, wearied of the struggle, Leclerc proposed terms, and Toussaint, induced by the most solemn guarantees on the part of the French, laid down his arms. He was seized and sent to France, where he died in prison in 1803. The blacks, infuriated by this act of treachery, renewed the struggle, under Jean Jacques Dessalines (1758-1806), with a barbarity unequalled in previous contests. The French, further embarrassed by the appearance of a British fleet, were only too glad to evacuate the island in November 1803.

The opening of the following year saw the declaration of independence, and the restoration of the aboriginal name of Haiti. Dessalines, made governor for life, inaugurated his rule with a bloodthirsty massacre of all the whites. In October 1804, he proclaimed himself emperor and was crowned with great pomp; but in 1806 his subjects, growing tired of his tyranny, assassinated him. His position was now contended for by several chiefs, one of whom, Henri Christophe (1767-1820), established himself in the north, while Alexandre Sabes Pétion (1770-1818) took possession of the southern part. The Spaniards re-established themselves in the eastern part of the island, retaining the French name, modified to Santo Domingo. Civil war now raged between the adherents of Christophe and Pétion, but in 1810 hostilities were suspended. Christophe declared himself king of Haiti under the title of Henry I.; but his cruelty caused an insurrection, and in 1820 he committed suicide. Pétion was succeeded in 1818 by General Jean Pierre Boyer (1776-1850), who, after Christophe's death, made himself master of all the French part of the island. In 1821 the eastern end of the island proclaimed its independence of Spain, and Boyer, taking advantage of dissensions there, invaded it, and in 1822 the dominion of the whole island fell into his hands. Boyer held the presidency of the new government, which was called the republic of Haiti, until 1843, when he was driven from the island by a revolution. In 1844 the people at the eastern end of the island again asserted their independence. The republic of Santo Domingo was established, and from that time the two political divisions have been maintained. Meanwhile in Haiti revolution followed revolution, and president succeeded president, in rapid succession. Order, however, was established in 1849, when Soulouque, who had previously obtained the presidency, proclaimed himself emperor, under the title of Faustin I. After a reign of nine years he was deposed and exiled, the republic being restored under the mutato president Fabre Geffrard. His firm and enlightened rule rendered him so unpopular that in 1867 he was forced to flee to Jamaica. He was succeeded by Sylvestre Sahrave, who, after a presidency of two years, was shot. Nissage-Saget (1870), Dominique (1874), and Boisrond-Canal (1876) followed, each to be driven out by exile by revolution. The next president, Salomon, maintained himself in office for ten years, but he too was driven from the country and died in exile. Civil war raged in 1889-1899 between Generals Légitime and Hippolyte, and the latter succeeded in obtaining the vacant presidency. He ruled with the most absolute authority till his death in 1896. General Tiresias Simon Sam followed and ruled till his flight to Paris in 1902. The usual civil war ensued, and after nine months of turmoil, order was restored by the election of Nord Alexis in December 1902.

Alexis' administration was unsuccessful, and was marked by many disturbances, culminating in his expulsion. In 1904 there was an attack by native sedlity on the French and German representatives, and punishment was exacted by these powers. In December 1904 ex-president Sam, his wife and members of his ministry were sentenced to long terms of imprisonment for fraudulently issuing bonds. In December 1907 a conspiracy against the government was reported and the ringleaders were sentenced to death. But in January 1908 the revolution spread, and Gonâve and St Marc and other places were reported to be in the hands of the insurgents. Prompt measures were taken, the rising was checked, and Alexis announced the pardon of the revolutionaries. In March, however, this pacific policy was reversed by a new ministry; some suspects were summarily executed, and the attitude of the government was only modified when the powers sent war-ships to Port-au-Prince. In September
the criminal court at the capital sentenced to death, by default, a large number of persons implicated in the risings earlier in the year, and in November rebellion broke out again. General Antoine Simon raised his standard at Angra do Heroismo, where he was joined by the renegade descendants of the noble Azorean houses, who deserted to him in great numbers. On the end of December Port-au-Prince was occupied without bloodshed by the revolutionaries, and Alexis took to flight, escaping with some difficulty, and finding refuge on a French ship. General Simon then assumed the presidency. At the end of April 1805 Alexis died in Jamaica, in circumstances of some obscurity; it had just been discovered that a plot was on foot to depose Simon, and further trouble was threatened.

HAJIPUR, a town of British India, in the Muzaffarpur district of Bengal, on the Gandak, just above its confluence with the Ganges opposite Patna. Pop. (1901), 21,308. Hajipur figures conspicuously in the history of the disputes between the Afghan and his rebellious Afghan governors of Bengal, being twice besieged and captured by the imperial troops, in 1572 and 1574. Within the limits of the old fort is a small stone mosque, very plain, but of peculiar architecture, and attributed to Haji Illyas, its traditional founder (c. 1530). Its command of water traffic in three directions makes the town a place of considerable commercial importance. Hajipur has a station on the main line of the Bengal and North-western railway.

HAJJI or Haji, the Arabic word, meaning literally a "setting out on" or "greater pilgrimage of" Mahomedans to Mecca, which takes place from the 8th to the 10th of the twelfth month of the Mahomedan year; the lesser pilgrimage, called umrah or hajr, is made at the mosque at Mecca at any time other than that of the hajji proper, and is also a meritorious act. The term hajji or hajri is given to those who have performed the greater pilgrimage. The word hajji is sometimes loosely used of any Mahomedan pilgrimage to a sacred place or shrine, and is also applied to the pilgrimages of Christians of the East to the Holy Sepulchre at Jerusalem (see MECCA; MAHOMEDAN RELIGION).

HAJI KLALPA [in full Muṣṭaṭṣa ibn ʿAbdallāh Kātib Chelebi Hājī Klalpā (ca. 1590-1658), Arabic and Turkish author, was born at Constantinople. He became secretary to the commissariat department of the Turkish army in Anatolia, was with the army in Bagdad in 1625, was present at the siege of Erzerum, and returned to Constantinople in 1628. In the following year he was again in Bagdad and Hamadan, and in 1633 at Aleppo, whence he made the pilgrimage to Mecca (hence his title Hājī). The following year he was in Erivān and then returned to Constantinople. Here he obtained a post in the head office of the commissariat department, which afforded him time for study and in the course of time some of the greatest teachers in the world of learning and the sciences. He published a number of works dealing with science generally, the titles of Arabic, Persian and Turkish books written up to his time are arranged in alphabetical order. With the titles are given, where possible, short notes on the author, his date, and sometimes the intro-ductory words of his work. It was edited by G. W. Fügler with Latin translation and a useful appendix (7 vols., Leipzig, 1835-1858). The text alone of this edition has been reproduced at Constantinople (1893).

Hajji Khāfī also wrote in Turkish a chronicle and a work on the history of general history (translated into Italian by G. R. Carl, Venice, 1697); a history of the Turkish empire from 1594 to 1655 (Constantinople, 1780); a history of the naval wars of the Turks (Constantinople, 1672); and the travels of Turboeck and the Sçin, translated by H. W. J. Galle (London, 1821); a general geography published at Constantinople, 1732 (Latin trans. by M. Norberg, London and Gotha, 1818; German trans. of part by J. von Hammer, Vienna, 1812; French trans. of part by J. N. V. C. M. R. de la Salle, translated by H. J. Galle, London, 1821). For his life see the preface to Fügler's edition; list of his works in C. Brockelmann's Gesch. d. arabischen Literatur (Berlin, 1902), vol. ii., pp. 428-429. (G. T. W.)

HAKE, EDWARD (fl. 1579), English satirist, was educated under John Hopkins, the part-author of the metrical version of the Psalms. He resided in Gray's Inn and Barnard's Inn. In the address "To the Gentle Reader" prefixed to his Neues out of Puelles Churchyard... Otherswise entituled Syr Nummus (2nd ed., 1579) he mentions the "first three yeeres which I spent in the Innes of Chancery, being now about a dozen of yeeres passed." In 1585 and 1586 he was mayor of New Windsor, and in 1588 he represented the borough in parliament. His last work was published in 1604. He was protected by the earl of Leicester, whose policy it was to support the Puritan party, and who no doubt found a valuable ally in so vigorous a satirist of error in clerical places as was Hake. Neues out of Puelles Churchyard... (translated by H. W. J. Galle) was re-issued in 1579 with the title quoted above. The book takes the form of a dialogue between Bertulph and Paul, who meet in the aisles of the cathedral, and is divided into eight "satyrns," dealing with the corruption of the higher clergy and of judges, the greed of attorneys, the tricks of physicians and apothecaries, the sumptuary laws, extravagant living, Sunday sports, the abuse of St Paul's cathedral as a meeting-place for business and conversation, usury, &c. It is written in rhymed fourteen-syllable metre, which is often more comic than the author intended. In the prefatory matter, a note, the "carping and scornful Scolopion," in which he attacks his enemies with small courtesy and much alliteration. One is described as a "carping carelessankercher churlse." He also wrote a translation from Thomas à Kempis, The Imitation, or Following of Christ (1567, 1568); A Touchstone for this Time (1574), a scurrilous attack on the Roman Catholic Church, followed by A true Exposicion of the Book of Walter Raleigh, by H. J. Galle (1575), enlarged in 1578 to A Joyfull Con- tinuance of the Commemoration, &c. and of Gold's Kingdom, and this Continuance (1604), a collection of pieces in prose and verse in which the author inveighs against the power of gold. A bibliography of these and of Hake's other works was compiled by Mr Charles Edmonds for his edition in 1872 of the Neues (Isham Reprints, No. 2, 1872).

HAKE, THOMAS GORDON (1800-1892), English poet, was born at Leeds, of an old Devonshire family, on the 10th of March 1800. His mother was a Gordon of the Huntly branch. He studied medicine at St George's hospital and at Edinburgh and Glasgow, but had given up practice for many years before his death, and had devoted himself to a literary life. In 1839 he published a prose epic Tales, republished in Ainsworth's magazine as Valdarna, which attracted the attention of D. G. Rossetti. In after years he became an intimate member of the circle of friends and followers gathered round Rossetti, who so far departed from his usual custom as to review Hake's poems in the Academy and in the Fortnightly Review. In 1871 he published Meditations; 1872, Parables and Tales; 1883, The Serpent Play; 1890, New Day Sonnets; and in 1892 his Memoirs of Eighty Years. Dr Hake's works had much subtlety and felicity of expression, and were warmly appreciated in a somewhat restricted literary circle. In his last published verse, the sonnets, he shows an advance in facility on the occasional harshness of his earlier work. He was given a Civil List literary pension in 1893, and died on the 11th of January 1895.
HAKE (Merluccius vulgaris), a fish which differs from the cod in having only two dorsal fins and one anal. It is very common on the coasts of Europe and eastern North America, but its flesh is much less esteemed than that of the true Gadi. Specimens 4 ft. in length are not scarce. There are local variations in the use of "hake" as a name; in America the "silver hake" (Merluccius bilinearis), sometimes called "whiting," and "Pacific hake" (Merluccius productus) are also food-fishes of inferior quality.

HAKAS ("Guests," or "Strangers"), a people of S.W. China, chiefly found in Kwang-Tung, Fu-Kien and Formosa. Their origin is doubtful, but there is some ground for believing that they are a branch of the Tung-chow Chinese. Their chiefest settlement is in the white earth, a flat plain in the neighborhood of the city of Shantung, in the province of Kiang-Si. They are tall, slender, dark-skinned people, and are the least of the Chinese. Their language is a true dialect of the Chinese language, but is not understood by the Chinese. Their chief occupation is fishing, and they are said to be the greatest fishermen in China.

HAKLUYT (c. 1553-1616), British geographer, was born of good family in or near London about 1553. The Hakluyts were of Welsh extraction, not Dutch as has been supposed. They appear to have settled in Herefordshire as early as the 13th century. The family seat was Eaton, 2 m. S.E. of Lecomber. Hugo Haklute was returned M.P. for that borough in 1564. Richard went to school at Westminster, where he was a queen's scholar; while there his future bent was determined by a visit to his cousin and namesake, Richard Hakluyt of the Middle Temple. His cousin's discourse, illustrated by "certain books of cosmogaphy, an universal mappe, and the Bible," made young Haklute resolve to "prosecute that knowledge and kind of literature." Entering Christ Church, Oxford, in 1570, "his exercises of duty first performed," he fell to his intended course of reading, and by degrees perused all the other prints then available. His intercourse with his fellow students was not trifling. He took his B.A. in 1573/4. It is probable that, shortly after taking his M.A. (1577), he began at Oxford the first public lectures in geography that "shewed both the old imperfectly composed and the new lately reformed mappes, globes, spheres, and other instruments of this art." That this was not in London is certain, as we know that the first lecture of the kind was delivered in the metropolis on the 4th of November 1588 by Thomas Hood.

Hakluyt's first published work was his Divers Voyages touching the Discoverie of America (London, 1582, 4to). This brought him to the notice of Lord Howard of Effingham, and so to that of Sir Edward Stafford, Lord Howard's brother-in-law; accordingly at the age of thirty, being acquainted with "the chiefest captains at sea, the greatest merchants, and the best mariners of our nation," he was selected as chaplain to accompany Stafford, now English ambassador at the French court, to Paris (1583). In accordance with the instructions of Secretary Walsingham, he occupied himself chiefly in collecting information of the Spanish and French movements, and "making diligent inquiry of such things as might yield any light unto our westerndiscoveries." Among the materials which Hakluyt's Paris are embodied in his important work entitled A particular discourse concerning Westerno discoveries written in the yer 1584, by Richard Hakluyt of Oxforde, at the requeste and direction of the right worshipfull Mr Walter Raphye before the comyng home of his two barks. This long-lost MS. was at last printed in 1587. Its object was to recommend the enterprise of planting the English race in the unsettled parts of North America. Hakluyt's other works consist mainly of translations and compilations, relieved by his dedications and prefaces, which last, with a few letters, are the only matter we possess of which a biography can be formed. Hakluyt revised English translations laid before Queen Elizabeth a copy of the Discourse "along with one in Latin upon Aristotle's Politics," and obtained, two days before his return to Paris, the grant of the next vacant prebend at Bristol, to which he was admitted in 1586 and held with his other preferments till his death.

While in Paris Hakluyt interested himself in the publication of the MS. journal of Laundonnere, the Histoire notable de la Florida, edited by Bassanier (Paris, 1586, 8vo). This was translated by Hakluyt and published in London in 1589 under the title of A notable historie containing feare voyages made by centayne French captaynus into Florida (London, 1589, 4to.). The same year De orbe novo Petri Martyris Angleriis decades octo illustratae labor et industria Richardi Hakluytii the light at Paris. This work contains the exceedingly rare copperplate map dedicated to Hakluyt and signed F. G. (supposed to be Francis Gualle); it is the first on which the name of "Virginia" appears.

In 1588 Hakluyt finally returned to England with Lady Stafford, after a residence in France of nearly five years. In 1589 he published the first edition of his chief work, The Principal navigations, voyages, traffiques and discoveries of the English nation (fol., London, 1 vol.). In the preface to this we have the announcement of the intended publication of the first terrestrial globe made in England by Molyneux. In 1590-1600 appeared the final, reconstructed and greatly enlarged edition of The Principal Navigations, Voyages, Traffiques and Discoveries of the English Nation (fol., 3 vols.). Some few copies contain an exceedingly rare map, the first of the Mercator projection made in England according to the true principles laid down by Edward Wright. Hakluyt's great collection, though but little read, has been truly called the "prose epic of the modern English nation." It is an invaluable treasure of material for the history of geographical discovery and colonization, which has secured for its editor a lasting reputation. In 1601 Hakluyt edited a translation from the Portuguese of Antonio Galvano, The Discoveries of the World (4to., London). In the same year his name occurs as an adviser to the East India Company, supplying them with maps, and informing them as to markets. Meantime in 1590 (April 20th) he had been instituted to the rectory of Withering-cum-Brockford, Suffolk. In 1603, on the 4th of May, he secured the prospective living of James Town, the intended capital of the intended colony of Virginia. This benefice he supplied, when the colony was at last established in 1607, by a curate, one Robert Hunt. In 1666 he appears as one
of the chief promoters of the petition to the king for patents to colonize Virginia. He was also a leading adventurer in the London or South Virginia Company. His last publication was a translation of Fernando de Soto's discoveries in Florida, entitled Virginia richly valued by the description of Florida her next neighbour (London, 1609, 4to). This work was intended to encourage further exploration of the region. Hakluyt's suggestion has been said, "England is more indebted for its American possession than to any man of that age." We may notice that it was at Hakluyt's suggestion that Robert Parke translated Mendoza's History of China (London, 1588-1589) and John Pory made his version of Leo Africanus (A Geographical History of Africa, London, 1600). Hakluyt died in 1616 (November 23rd) and was buried in Westminster Abbey (November 26th); by an error in the abbey register his burial is recorded under the year 1626. Out of his various emoluments and preferences (of which the last was Gedney rectory, Lincolnshire, in 1672) he amassed a small fortune, which was squandered by a son. A number of his MSS., sufficient to form a fourth volume of his collections of 1598-1600, fell into the hands of Samuel Purchas, who inserted them in an abridged form in his Pilgrimes (1625-1626, fol.). Others are preserved at Oxford (Bib. Bod. MS. Sold. B. 8), which consist chiefly of notes gathered from contemporary authors.

Besides the MSS., or editions noticed in the text (Divers Voyages (1582); Particular Discourse (1584); Laudonnière's Florida (1587); Petrus Martyr's Discoveries in America (1493); Hakluyt's Voyages (1600); Galvano's Discoveries (1601); De Soto's Florida record, the Virginia richly valued (1609, &c.), we may notice the Hakluyt Society London edition of the Divers Voyages (1850), the English translation of the Principal Discourses by Charles Dore (Cambridge, 1870, with an introduction by Leonard Woods); also, among modern issues of the Principal Navigations, those of 1809 (5 vols., with much additional matter), and of 1902-1905 (Glasgow, 12 vols.). The new title-page issued for the first volume of the final edition of the Principal Navigations, in 1599, merely cancelled the former 1598 title with its reference to the Cadiz expedition of 1596; but from this has arisen the mistaken supposition that a new edition was then (1599) published. Hakluyt's Galvano was edited for the Hakluyt Society by Admiral C. R. D. Bechune in 1862. This Society, which was founded in 1846 for printing rare and unpublished voyages and travels, includes the Glasgow edition of the Principal Navigations in its extra series, as well as C. R. Beazley's edition of Carpeius, Rabugnis, and other medieval texts from Hakluyt (Cambridge, 1903, 3 vols.). Reckoning in these and an issue of Purchas's Pilgrimes by the Glasgow publisher of the Hakluyt of 1903-1905, the society has now published or "gathered" more than two hundred "Narratives" to Hakluyt. It also prepared a Select Edition of the Principal Navigations, by E. J. Payne (Oxford, 1880; 1893; new edition by C. R. Beazley, 1907). For Hakluyt's life the dedications of the 1589 and 1598 editions of Divers Voyages, and the prefatory comment of Winter Jones's introduction to the Hakluyt Society edition of the Divers Voyages; Fuller's Worthies of England, "Herefordshire"; Oxford Univ. Reg. (Oxford Hist. Soc.), ii., iii. 39; Historical MSS. Commission, Report (1883); and lastly the biographical Towneley MSS., referring to payments (prizes?) awarded to Hakluyt when Oxford, May 12th and June 4th, 1575. (C. H. C.; C. R. B.)

HAKODATE—HALBERSTADT

Tokyo. Hakodate was opened to American commerce in 1854. In the civil war of 1868 the town was taken by the rebel fleet, but it was recovered by the mikado in 1869.

HAL, a town of Brabant, Belgium, about 9 m. S.W. of Brussels, situated on the river Sene and the Charleroi canal. Pop. (1904) 13,540. The place is interesting chiefly on account of its fine church of Notre Dame, formerly dedicated to St. Martin. This church, a good example of pure Gothic, was begun in 1341 and finished in 1400. Its principal ornament is the alabaster altar, by J. More, completed in 1533. The bronze font dates from 1446. Among the monuments is one in black marble to the dauphin Joachim, son of Louis XL, who died in 1460. In the treasury of the church are many costly objects presented by illustrious personages, among others by the emperor Charles V., King Henry VIII. of England, Charles the Bold of Burgundy, and several princes. The church is chiefly celebrated, however, for its miraculous image of the Virgin. Legend says that during a siege the bullets fired into the town were caught by her in the folds of her dress. Some of these are still shown in a chest that stands in a side chapel. In consequence of this belief a great pilgrimage, attended by thousands from all parts of Belgium, is paid annually to this church. The hotel de ville dates from 1676 and has been restored with more than ordinary good taste.

HALA, or HALLA (formerly known as Murtazabad), a town of British India in Hoyazarab district, Sindh, Pop. (1901) 4,265. It has long been famous for its glazed pottery, and tiles made from a fine clay obtained from the Indus, mixed with powdered flints. The town has also a manufacture of sussis or striped trouser-cloths.

HALAES, an ancient town on the north coast of Sicily, about 14 m. E. of Cefaloedion [Cefalu], to the east of the modern Castel di Tusa, founded in 403 B.C. by Archonides, tyrant of Herbita, whose name it sometimes bore: we find, e.g., Hallos Archonida on a coin of the time of Augustus (Corp. inscr. Lat., Berlin, 1885, p. 766). It was the first town to surrender to the Romans in the First Punic War, and was granted freedom and immunity from tithes. It became a place of some importance in Roman days, especially as a port, and entirely outstripped its mother city. Halaea is the only place in Sicily where an inscription dedicated to a Roman governor of the republican period (perhaps in 93 B.C.) has come to light. (T. A.).

HALAKHA, or HALACHA (literally "rule of conduct"), the rabbinical development of the Mosaic law; with the haggada it makes up the Talmud and Midrash (q.v.). As the haggada is the poetic, so the halakha is the legal element of the Talmud (q.v.). It is the result of the faction between the Sadducees, who disputed the traditions, and the Pharisees, who strove to prove their derivation from scripture. Among the chief attempts to codify the halakha were the Great Rules (Halakhoth Gedoloth) of Simon Kayyara (9th century), based on the letters written by the Gaonim, the heads of the Babylonian schools, to Jewish inquirers in many lands, the work of Jacob Alfassi (1013-1015), the Strong Hand of Maimonides (1180), and the Table Prepared (Shulhan Aruch) of Joseph Qaro (1563), which from its practical scope and its clarity as a work of general reference became the universal authority throughout Jewish communities. (J. G. A. H.)

HALBERSTADT, a town of Germany, in the Prussian province of Saxony, 56 m. by rail N.W. of Halle, and 29 S.W. of Magdeburg. It lies in a fertile country to the north of the Harz Mountains, on the Holzemme, at the junction of railways to Halle, Goslar and Thale. Pop. (1905) 45,534. The town has a medieval appearance, many old houses decorated with beautiful wood-carving still surviving. The Gothic cathedral (now Protestant), dating from the 13th and 14th centuries, is remarkable for the majestic impression made by the great height of the interior, with its slender columns and lofty, narrow aisles. The treasure preserved in the former chapter-house, is rich in reliquaries, vestments and other objects of medieval church art. The beautiful spires, which had become unsafe, were rebuilt in 1890-1895. Among the other churches the only one of special interest is the Liebfrauenkirche (Church of Our Lady).
a basilica, with four towers, in the later Romanesque style, dating from the 12th and 13th centuries and restored in 1845, containing Old mural frescoed and carved figures. Remarkable among the other old buildings are the town-hall, of the 14th century and restored in the 17th century, with a crypt, and the Petershof, formerly the episcopal palace, but now utilized as law courts and a prison. The principal educational establishment is the gymnasium, with a library of 40,000 volumes. Close to the cathedral lies the house of the poet Gleim (q.v.), since 1899 the property of the municipality and converted into a museum. It contains a collection of the portraits of the friends of the poet-scholar and some valuable manuscripts. The principal manufactures of the town are cigars and paper, glazed chemical products, beer and machinery. About a mile and a half distant are the Spiegelberge, from which a fine view of the surrounding country is obtained, and the Klusberge, with prehistoric cave-dwellings cut out in the sandstone rocks.

The history of Halberstadt begins with the transfer to it, by Bishop Holdegrim I., in 820 of the see founded by Charlemagne at Seligenstadt. At the end of the 10th century the bishops were granted by the emperors the right to exercise temporal jurisdiction over their see, which became one of the most considerable of the ecclesiastical principalities of the Empire. As such it survived the introduction of the Reformation in 1542; but in 1556, on the death of Sigismund of Brandenburg (also archbishop of Magdeburg from 1552 to 1560), the last Catholic bishop, the chapter, from motives of expediency, elected Francois de Brandis, a Protestant. In 1589 he became duke of Brunswick, and two years later he abolished the Catholic rites in Halberstadt. The see was governed by an archbishop, who was formally cal. the prince-bishop, and from the early history of Westphalia to a secular principality for the elector of Brandenburg. By the treaty of Tilsit in 1807 it was annexed to the kingdom of Westphalia, but came again to Prussia on the dissolution of Poland.

The town received a charter from Bishop Arnulf in 998. In 1113 it was burnt by the emperor Henry V., and in 1179 by Henry the Lion. During the Thirty Years' War it was occupied alternately by the Imperialists and the Swedes, the latter of whom handed it over to Brandenburg.

See Lucanus, Der Dom zu Halberstadt (1887), Wegweiser durch Halberstadt und seine Liebfrauenkirche zu Halberstadt (1872); Scheffer, Inschriften und Legenden halberstädtischer Bauten (1864); Schmidt, Urbekundenbuch der Stadt Halberstadt (Halle, 1878); and Zschiesche, Halberstadt, sonst und jetzt (1882).

HALBERT, HALBERD or HALBARD, a weapon consisting of an axe-blade balanced by a pick and having an elongated pike-head at the end of the shaft, which was usually about 5 or 6 ft. in length. The utility of such a weapon in the wars of the later middle ages lay in this, that it gave the foot soldier the means of dealing with an armoured man on horseback. The pike could do no more than keep the horseman at a distance. This ensured security for the foot soldier but did not enable him to strike a mortal blow, for which firstly a long-handled and secondly a powerful weapon, capable of striking a heavy cleaving blow, was required. Several different forms of weapon responding to these requirements are described and illustrated below; it will be noticed that the thrusting pike is almost always combined with the cutting-bill hook or axe-head, so that the individual billman or halberdier should not be at a disadvantage if caught alone by a mounted opponent, or if his first descending blow missed its object. It will be noticed further that, concurrently with the disuse of complete armour and the development of firearms, the pike or thrusting element gradually displaces the axe or cleaving element in these weapons, till at last we arrive at the court halberts and partizans of the late 16th and early 17th centuries and the so-called "halbert" of the infantry officer and sergeant in the 18th, which can scarcely be classed even as partizans.

Figs. 1-6 represent types of these long cutting, cut and thrust weapons of the middle ages, details being omitted for the sake of clearness. The most primitive is the vouge (fig. 1), which is simply a heavy cleaver on a pole, with a point added. The next form, the gisarme or guisarme (fig. 2), appears in infinite variety but is always distinguished from vougies, &c. by the hook, which was used to pull down mounted men, and generally resembles the agricultural bill-hook of to-day. The glaive (fig. 3 is late German) is a broad, heavy, slightly curved sword-blade on a stave; it is often combined with the hooked gisarme as a gisarme-gisarme (fig. 4, Burgundian, about 1450). A gisarme-gisarme is shown in fig. 5 (Swiss, 14th century). The weapon best known to Englishmen is the bill, which was originally a sort of scythe-blade, sharp on the concave side (whereas the glaive has the cutting edge on the convex side), but in its best-known form it should be called a bill-gisarme (fig. 6). The partizan, ranseur and halberd proper developed naturally from the earlier types. The feature common to all, as has been said, is the combination of spear and axe. In the halberts the axe predominates, as the examples (fig. 10, Swiss, early 15th century; fig. 11, Swiss, middle 16th century; and fig. 12, German court halbert of the same period as fig. 11) show. In the partizan the pike is the more important, the axe-heads being reduced to little more than an ornamental feature. A South German specimen (fig. 9, 1615) shows how this was compensated by the broadening of the spear-head, the edges of which in such weapons were sharpened. Fig. 8, a service weapon of simple form, merely has projections on either side, and from this developed the ranseur (fig. 7), a partizan with a very long and narrow point, like the blade of a rapier, and with fork-like projections intended to act as "sword-breakers," instead of the atrophied axe-heads of the partizan proper.

The halbert played almost as conspicuous a part in the military history of Middle Europe during the 15th and early 16th centuries as the pike. But, even in a form distinguishable from the voville and the glaive, it dates from the early part of the 14th century, and for many generations thereafter it was a useful and effective weapon of the Swiss. Fauchet, in his Origines des d'guis, printed in 1600, states that Louis XI. of France ordered certain new weapons of war called hallebardes to be made at Angers and other places in 1475. The Swiss had a mixed armament of pikes and halberts at the battle of Morat in 1476. In the 15th and 16th centuries the halberts became larger, and the blades were formed in many varieties of shape, often engraved, inlaid, or pierced in open work, and exquisitely finished as works of art. This weapon was in use in England from the reign of Henry VII. to the reign of George III., when it was still carried (though in shape it had certainly lost its original characteristics, and had become half partizan and half pike) by sergeants in the guards and other infantry regiments. It is still retained as the symbol of authority borne before the magistrates on public occasions in some of the burghs of Scotland. The Lochaber axe may be called a species of halbert furnished with a hook on the end of the staff at the back of the blade. The godendrag (Fr. godendard) is the Flemish name of the halbert in its original form. The derivation of the word is as follows. The O. Fr. hallebarde, of which the English "halberd," "halbert," is an adaptation, was itself adapted from the M.H.G. helmebarde, mod. Hellebarde; the second part is the O.H.G. berta or borta, broad-axe, probably the same word as Barti, beard, and so called from its shape; the first part is either helm, handle, cf. "helm," tiller of a ship, the word meaning "hafted axe," or else helm, helmet, an axe for smiting the helmet. A common derivation was to take the word as representing a Ger. halb-barde, half-axe; the early German form shows this to be an erroneous guess.
HALDANE, JAMES ALEXANDER (1768-1851), Scottish divine, the younger son of Captain James Haldane of Airthrey House, Stirlingshire, was born at Dundee on the 14th of July 1768. Educated first at Dundee and afterwards at the high school and university of Edinburgh, at the age of seventeen he joined the "Duke of York's Militia," in which he served as a midshipman. After four voyages to India he was nominated to the command of the "Melville Castle" in the summer of 1793; but having during a long and unexpected detention of his ship begun a careful study of the Bible, and also come under the evangelical influence of David Bogue of Gosport, one of the founders of the London Missionary Society, he abruptly resolved to quit the naval profession for a religious life, and returned to Scotland before his ship had sailed. About the year 1796 he became acquainted with the celebrated evangelical Charles F. Burdon, and made several tours through Scotland, endeavouring by tract-distribution and other means to awaken others to some of that interest in religious subjects which he himself so strongly felt. In May 1797 he preached his first sermon, at Gilmerton near Edinburgh, with encouraging success. In the same year he established a non-sectarian organization for tract distribution and lay preaching called the "Society for the Propagation of the Gospel at Home." During the next few years he made repeated missionary journeys of preaching wherever he could obtain hearers, and generally in the open air. Not originally disloyal to the Church of Scotland, he was gradually driven by the hostility of the Assembly and the exigencies of his position into separation. In 1799 he was ordained as pastor of a Large Independent Congregation in Edinburgh. This was the first congregational church known by that name in Scotland. In 1801 a permanent building replaced the circus in which the congregation had at first met. To this church he continued to minister gratuitously for more than fifty years. In 1808 he made public avowal of his conversion to Baptist views. As advancing years compelled him to withdraw from the more exhausting labours of itineracy and open-air preaching, he sought more and more to influence the discussion of current religious and theological questions by means of the press. He died on the 8th of February 1851.

His son, Daniel Rutherford Haldane (1824-1887), by his second wife, a daughter of Professor Daniel Rutherford, was a prominent Scottish physician, who became president of the Edinburgh College of Physicians.

Among J. A. Haldane's numerous contributions to current theological discussions were: The Duty of Christian Perserverance to Regard to Points of Church Order (1811); Strictures on a Publication upon Primitive Christianity by Mr John Walker (1819); Refutation of the Argument from the Man's Atonement (1842); The Doctrine of the Atonement (1845); Exposition of the Epistle to the Galatians (1848).

HALDANE, RICHARD BURDON (1836- ), British statesman and philosopher, was the third son of Robert Haldane of Cl aimsden, Perthshire, a writer to the signet, and nephew of J. S. Burdon-Sanderson. He was a grand-nephew of the Scottish divines J. A. and Robert Haldane. He was educated at Edinburgh University and the universities of Edinburgh and Gottingen, where he studied philosophy under Lotze. He took first-class honours in philosophy at Edinburgh, and was Gray scholar and Ferguson scholar. A philosophy of the four Scottish Universities (1876). He was called to the bar in 1879, and early as 1890 became a queen's counsel. In 1885 he entered parliament as liberal member for Haddingtonshire, for which he was re-elected continuously up to and including 1910. He was included in 1905 in Sir H. Campbell-Bannerman's cabinet as secretary for war, and was the author of the important scheme for the reorganization of the British army, by which the militia and the volunteer forces were replaced by a single territorial force. Though always known as one of the ablest men of the Liberal party and conspicuous during the Boer War of 1899-1902 as a Liberal Imperialist, the choice of Mr Haldane for the task of thinking out a new army organization on business lines had struck many people as an extraordinary one. Being a chancery lawyer, he was more particularly a philosopher whose convictions were based on his knowledge of Hegelian metaphysics. But with German philosophy he had also the German sense of thoroughness and system, and his scheme, while it was much criticized, was recognized as the best that could be done with a voluntary army. Mr Haldane's chief literary publications were: Life of Adam Smith (1887); Education and Empire (1902); The Pathway to Reality (1903). He also translated, jointly with J. Kemp, Schopenhauer's "Die Welt als Wille und Vorstellung (The World as Will and Idea," 3 vols. 1883-1886.

HALDANE, ROBERT (1764–1842), Scottish divine, elder brother of J. A. Haldane (g.), was born in London on the 28th of February 1764. After attending classes in the Dundee grammar school and in the high school and university of Edinburgh in 1780, he joined H.M.S. "Monarch," of which his uncle Lord Duncan was at that time in command, and in the following year was transferred to the "Foudroyant," on board of which, during the night engagement with the "Pegase," he greatly distinguished himself. Haldane was afterwards present at the relief of Gibraltar, but at the peace of 1783 he finally left the navy, and soon afterwards settled on his estate of Airthrey near Stirling. He put himself under the tuition of David Bogue of Gosport and carried away deep impressions from his academy. The earlier phases of the French Revolution excited his deepest sympathy, a sympathy which induced him to avenge his own disapproval of the war with France. As his over-sanguine visions of a new order of things to be ushered in by political change disappeared, he began to direct his thoughts to religious subjects. Resolving to devote himself and his means wholly to the advancement of religion, in February 1790 he proposed that, made in 1796, to organize a vast mission to Bengal, of which he was to provide the entire expense; with this view the greater part of his estate was sold, but the East India Company refused to sanction the scheme, which therefore had to be abandoned. In December 1797 he joined his brother and some others in the formation of the "Society for the Propagation of the Gospel at Home," in building chapels or "tabernacles" for congregations, in supporting missionaries, and in maintaining institutions for the education of young men to carry on the work of evangelization. He is said to have spent more than £70,000 in the course of the following twelve years (1798–1810), in the establishment of a plan for evangelizing Africa by bringing over native children to be trained as Christian teachers to their own countries. In 1816 he visited the continent, and first at Geneva and afterwards in Montauban (1817) he lectured and interviewed large numbers of theological students with remarkable effect; among them were Malan, Monod and Merle d'Aubigné. Returning to Scotland in 1819, he lived partly on his estate of Auchengray and partly in Edinburgh, and like his brother took an active part, chiefly through the press, in many of the religious controversies of the time. He died on the 12th of December 1842.

In 1816 he published a work on the Evidence and Authority of Divine Revelation, and in 1819 the substance of his theological prelections in a Commentaire sur l'Éphème aux Romains. Among his later writings, besides numerous pamphlets on what was known as the "Apocrypha controversy," are a treatise On the Inspiration of Scripture (1828), which has passed through many editions, and a later Exposition of the Epistle to the Romans (1835), which has been frequently reprinted, and has been translated into French and German.

HALDANE, SAMUEL STEHMAN (1812–1880), American naturalist and philologist, was born on the 12th of August 1812 at Locust Grove, Pa. He was educated at Dickinson College, and in 1831 was appointed professor of the natural sciences in the university of Pennsylvania. In 1855 he went to Delaware College, where he filled the same position, but in 1869 he returned to the university of Pennsylvania as professor of
comparative philology and remained there till his death, which occurred at Chickles, Pa., on the 10th of September 1880. His writings include *Freshwater Univalve Mollusca of the United States* (1840); *Zoological Contributions* (1842-1843); *Analytic Orthography* (1840); *Tours of a Chess Knight* (1846); *Pennsylvania Dutch, a Dialect of South German with an Infusion of English* (1872); *Outlines of Eymology* (1877); and *Word-Building* (1881).

**Haldimand, Sir Frederick** (1718–1791), British general and administrator, was born at Yverdon, Neuchâtel, Switzerland, on the 11th of August 1718, of Huguenot descent. After serving in the armies of Sardinia, Russia and Holland, he entered British service in 1754, and subsequently naturalized as an English citizen. During the Seven Years' War he served in America, was wounded at Ticonderoga (1758) and was present at the taking of Montreal (1760). With filling up credit several administrative positions in Canada, Florida and New York, in 1778 he succeeded Sir Guy Carleton (afterwards Lord Dorchester) as governor-general of Canada. His measures against French sympathizers with the Americans have incurred extravagant strictures from French-Canadian historians, but he really showed moderation as well as energy. In 1785 he returned to London. He died at his birthplace on the 5th of June 1791.

His life has been well written by Jean McIlwraith in the "Makers of Canada" (Toronto, 1904). His Correspondence and Diaries fill 262 volumes in the Canadian Archives, and are catalogued in the Annual Reports (1884-1889).

**Hale, Edward Everett** (1832-1909), American author, was born in Boston on the 3rd of April 1822, son of Nathan Hale (1784-1863), proprietor and editor of the Boston *Daily Advertiser*, nephew of Edward Everett, the orator and statesman, and grandson of Nathan Hale, the martyr spy. He graduated from Harvard in 1849; was pastor of the church of the Unitarian Church, Worcester, Massachusetts, in 1846-1856, and of the South Congregational (Unitarian) church, Boston, in 1856-1890; and in 1903 became chaplain of the United States Senate. He died at Roxbury (Boston), Massachusetts, on the 10th of June 1909. His forceful personality, organizing genius, and liberal practical theology, together with his deep interest in the anti-slavery movement (especially in Kansas), popular education (especially Chautauqua work), and the working-man's home, were active in raising the tone of American life for half a century. He was a constant and voluminous contributor to the newspapers and magazines. He was an assistant editor of the Boston *Daily Advertiser*, and edited the *Christian Examiner, Old and New* (which he assisted in founding in 1869; in 1875 it was merged in the * Scribner's Magazine,* *Lend a Hand* (founded by him in 1886 and merged in the *Charities Review* in 1897), and the *Lend a Hand Record*; and he was the author or editor of more than sixty books—fiction, travel, sermons, biography, and history.

He first came into notice as a writer in 1839, when he contributed the short story "My Double and How He Undid Me" to the *Atlantic Monthly*. He soon published in the same periodical other stories, the best known of which was "The Man Without a Country" (1863), which did much to strengthen the American cause in the North, and in which, as in some of his other non-romantic tales, he employed a minute realism which has led his readers to suppose the narrative a record of fact. The two stories mentioned, and such others as "The Rag-Man and the Rag-Woman" and "The Skeleton in the Closet," gave him a prominent position among the short-story writers of America. The story "Ten Times One is Two" (1870), with its hero Harry Wadsworth, and its motto, first enunciated in 1866 in his Lowell Institute lectures, "Look up and not down, look forward and back, look out and not in, and lend a hand," led to the formation among young people of the "Lend-a-Hand Clubs," "Look-up Legions" and "Harry Wadsworth Clubs." Out of the romantic Waldensian story *In His Name* (1873) there similarly grew several other organizations for religious work, such as "King's Daughters," and "King's Sons.

Among his other books are Kansas and Nebraska (1854); *The Ingham Papers* (1869); *His Level Best, and Other Stories* (1870); *Sybaris and Other Homes* (1871); *Philip Nolan's Friends* (1876), his best-known novel, and a sequel to *The Man Without a Country; The Kingdom of God* (1880); *Christmas at Narragansett* (1885); *East of the Peninsula* (1886); *West of the Peninsula* (1887); *For Ever* (1892); *Yesternight* (1894); and *Waldenwood* (1895). He edited the *Englishman of England* (1853), and contributed to Winsor's *Memorial History of the United States* and to *Narrative and Critical History of America* (1886-1886). With his son, Edward Everett Hale, Jr., he published *Franklin in France* (1885). He died at Cambridge, Mass., on the 17th of January 1893. His charming books of his later years were *A New England Boyhood* (1893), *James Russell Lowell and His Friends* (1899), and *Memories of the Harvard Yard* (1902).

A uniform and revised edition of his principal writings, in ten volumes, appeared in 1899-1901.

**Hale, Horatio** (1817-1890), American ethnologist, was born in Newport, New Hampshire, on the 3rd of May 1817. He was the son of David Hale, a lawyer, and of Sarah Josepha Hale (1790-1879), a popular poet, who, besides editing Godey's *Lady's Magazine* for many years and publishing some ephemeral books, is supposed to have written the verses "Mary had a little lamb," and to have been the first to suggest the national observance of Thanksgiving Day. The son graduated in 1837 at Harvard, and during 1838-1842 was philologist to the United States Exploring Expedition, which under Captain Charles Wilkes sailed around the world. Of the reports of that expedition Hale prepared the sixth volume, *Ethnography and Philology* (1846), which is said to have "laid the foundations of the ethnography of Polynesia." He was admitted to the Chicago bar in 1855, and in the following year removed to Clinton, Ontario, Canada, where he practised his profession, and where on the 28th of December 1866 he died. He made many valuable contributions to the science of ethnology, attracting attention particularly by his theory of the origin of the diversities of human languages and dialects—a theory suggested by his study of "child-languages," or the languages invented by little children. He also emphasized the importance of languages as tests of mental capacity and as "criteria for the classification of human groups."

He was, moreover, the first to discover that the Tutelos of Virginia belonged to the Siouan family, and to identify the Cherokee as a member of the Iroquian family of speech. Besides writing numerous magazine articles, he read a number of valuable papers before learned societies. These include: *Indien Migrations as Evidenced by Language* (1882); *The Origin of Languages and the Antiquity of Speaking Man* (1886); *The Development of Language* (1888); and *Language as a Test of Mental Capacity: Being an Attempt to Demonstrate the True Basis of Anthropology* (1891). He also edited for Britton's "Library of Aboriginal Literature," the *Iroquois Book of Rites* (1883).

**Hale, John Parker** (1866-1873), American statesman, was born at Rochester, New Hampshire, on the 31st of March 1866. He graduated at Harvard College in 1883. He was elected to the New Hampshire bar in 1830, was a member of the state House of Representatives in 1832, and from 1834 to 1841 was United States district attorney for New Hampshire. In 1843-1845 he was a Democratic member of the national House of Representatives, and, though his earnest co-operation with John Quincy Adams in securing the repeal of the "gag rule" directed against the presentation to Congress of anti-slavery petitions estranged him from the leaders of his party, he was re-nominated without opposition. In January 1845, however, he refused in a public statement to obey a resolution (28th of December 1844) of the state legislature directing him and his New Hampshire associates in Congress to support the cause of the annexation of Texas, a Democratic measure which Hale regarded as being distinctively in the interest of slavery. The Democratic State convention was at once re-assembled, Hale was denounced, and his nomination withdrawn. In the election which followed Hale ran independently, and, although the Democratic candidates were elected in the other three congressional districts of the state, his vote was large enough to prevent any choice (for which a majority was necessary) in his own. Hale then made the face of apparently hopeless odds to win over his state to the anti-slavery cause. The remarkable canvass which he conducted
HALE, SIR M.—HALE, NATHAN

is known in the history of New Hampshire as the “HALE Storm of 1845.” The election resulted in the choice of a legislature controlled by the Whigs and the independent Democrats, he himself being chosen as a member of the state House of Representatives, of which he in 1846 was speaker. He is remembered, however, chiefly for his long service in the United States Senate, of which he was a member from 1847 to 1853 and again from 1855 to 1864. At first he was the only out-and-out anti-slavery senator,—he alone prevented the vote of thanks to General Taylor and General Scott for their Mexican war victories from being made unanimous in the Senate (February 1848) — but in 1849 Salmon P. Chase and William H. Seward, and in 1851 Charles Sumner joined him, and the anti-slavery cause became for the first time a force to be reckoned with in that body. In October 1849 he had been nominated for president by the Liberty party, but he withdrew in favour of Martin Van Buren, the Free Soil candidate, in 1848. In 1851 he was senior counsel for the rescuers of the slave Shadrach in Boston. In 1852 he was the Free Soil candidate for the presidency, but received only 156,149 votes. In 1850 he secured the abolition of flogging in the U.S. navy, and through his efforts in 1862 the spirit ration in the navy was abolished. He was one of the organizers of the Republican party, and during the Civil War was an eloquent supporter of the Union and chairman of the Senate naval committee. In 1865 he was United States Senator from Spain. He died at Dover, New Hampshire, on the 10th of December 1873. A statue of Hale, presented by his son-in-law William Eaton Chandler (b. 1835), U.S. senator from New Hampshire in 1887–1901, was erected in front of the Capitol in Concord, New Hampshire, in 1892.

HALE, SIR MATTHEW (1609–1670), lord chief justice of England, was born on the 1st of November 1609 at Alderley in Gloucestershire, where his father, a retired barrister, had a small farm. His paternal grandfather was a rich clothier of Wotton-under-Edge; on his mother’s side he was connected with the noble family of the Poyntzses of Acton. Left an orphan when five years old, he was placed by his guardian under the care of the Puritan vicar of Wotton-under-Edge, with whom he remained till he attained his sixteenth year, when he entered Magdalen Hall, Oxford. At Oxford, Hale studied for several terms with a view to holy orders, but suddenly there came a change. The diligent student, first attracted by a company of strolling players, threw aside his studies, and plunged carelessly into gay and other anti-clerical妥 ways. He soon despised the coarse life he had professed and resolved to trail a pike as a soldier under the prince of Orange in the Low Countries. Before going abroad, however, Hale found himself obliged to proceed to London in order to give instructions for his defence in a legal action which threatened to deprive him of his patrimony. His leading counsel was the celebrated Sergeant Glanville (1580–1661), who, perceiving in the acuteness and sagacity of his youthful client a peculiar fitness for the legal profession, succeeded, with much difficulty, in inducing him to renounce his military for a legal career, and on the 5th of November 1629 Hale became a member of the honourable society of Lincoln’s Inn.

He immediately resumed his habits of intense application. The rules which he laid down for himself, and which are still extant in his handwriting, prescribe sixteen hours a day of close application, and prove, not only the great mental power, but also the extraordinary physical strength he must have possessed, and for which indeed, during his residence at the university, he had been remarkable. During the period allotted to his preliminary studies, he read over and over again all the yearbooks, reports, and law treatises in print, and at the Tower of London and other ancient repositories committed carefully studied the records from the foundation of the English monarchy down to his own time. But Hale did not confine himself to law. He dedicated no small portion of his time to the study of pure mathematics, to investigations in physics and chemistry, and even to anatomy and architecture; and there can be no doubt that this varied learning enhanced considerably the value of many of his judicial decisions.

Hale was called to the bar in 1637, and almost at once found himself in full practice. Though neither a fluent speaker nor bold pleader, in a very few years he was at the head of his profession. He entered public life at perhaps the most critical period of English history. Two parties were contending in the state, and their obstinacy could not fail to produce a most direful consequence. But amidst the confusion Hale steered a middle course, rising in reputation, and an object of solicitation from both parties. Taking Pomponius Atticus as his political model, he was persuaded that a man, a lawyer and a judge could best serve his country and benefit his countrymen by holding aloof from partisanship and its violent prejudices, which are so apt to distort and confuse the judgment. But he is best vindicated from the charges of selfishness and cowardice by the thoughts and meditations contained in his private diaries and papers, where the purity and honour of his motives are clearly seen. It has been said, but without certainty, that Hale was engaged as counsel for the earl of Strafford; he certainly acted for Archbishop Laud, Lord Maguire, Christopher Love, the duke of Hamilton and others. It is also said that he was ready to plead on the side of Charles I. had that monarch submitted to the court. The parliament having gained the ascendency, Hale signed the Solemn League and Covenant, and was a member of the first assembly of divines at Westminster in 1644; but although he would undoubtedly have preferred a Presbyterian form of church government, he had no serious objection to the system of modified Episcopacy proposed by Usher. Consistently with his desire to remain neutral, Hale took the engagement to the Commonwealth as he had done to the king, and in 1653, already serjeant, he became a judge in the court of common pleas. Two years afterwards he sat in Cromwell’s parliament as one of the members for Gloucestershire. After the death of the protector, however, he declined to act as a judge under Richard Cromwell, although he represented Oxford in Richard’s parliament. At the Restoration in 1660 Hale was very gladly received by Charles II., and in the same year was appointed chief baron of the exchequer, and accepted, with extreme reluctance, the honour of knighthood. After holding the office of chief baron for eleven years he was raised to the higher dignity of lord chief justice, which he held till February 1676, when his failing health compelled him to resign. He retired to his native Alderley, where he died on the 25th of December of the same year. He was twice married and survived all his ten children save two Nephews, and in 1670 wrote his Life of Sir Charles Cotterell, or History of the King, the House of the Crown, and the History of the Common Law of England in respect of the Practice of the Law, &c. (1715). Among his numerous religious writings the Contemplations, Moral and Divine, occupy the first place. Others are The Primitive Origination of Man (1677); Of the Nature of True Religion, &c. (1684); A Brief Abstract of the Christian Religion (1688). One of his most popular works is the collection of Letters of Advice to his Children and Grandchildren. He also wrote an Essay touching the Generation or Nongravitation of Fluid Bodies (1673); Difficulties Nugas, or Observations touching the Torricellian Experiment, &c. (1675); and a translation of the Life of Pomponius Atticus, by J. B. Williams (1660). He wrote two Nephews (1676). And he was one of the five who wrote the Lives of the Judges. He left his valuable collection of MSS. and records to the library of Lincoln’s Inn. His life has been written by G. Burnet (1682); by J. B. Williams (1835); by H. Roscoe, in his Lives of Eminent Lawyers, in 1838; by Lord Campbell, in his Lives of the Chief Justices, in 1849; and by E. Foss in his Lives of the Judges (1848–1870).

HALE, NATHAN (1756–1776), American hero of the War of Independence, was born at Coventry, Conn., and educated...
Hale, W. G.—Hales, Stephen

at Yale, then becoming a school teacher. He joined a Connecticut regiment after the breaking out of the war, and served in the siege of Boston, being commissioned a captain at the opening of 1776. When Heath's brigade departed for New York he went with them, and the tradition is that he was one of a small and daring band who captured an English provost sloop from under the very guns of a man-of-war. But on the 21st of September, having volunteered to enter the British lines to obtain information concerning the enemy, he was captured in his disguise of a Dutch school-teacher and on the 22nd was hanged. The penalty was in accordance with military law, but young Hale's act was a brave one, and he has always been glorified as a martyr. Tradition attributes to him the saying that he only regretted that he had but one life to lose for his country; and it is said that his request for a Bible and the services of a minister was refused by his captors. There is a fine statue of Hale by Macmonnies in New York.

See H. P. Johnston, Nathan Hale (1901).

Hale, William Gardner (1838-1876), American classical scholar, was born on the 9th of February 1849 in Savannah, Georgia. He graduated at Harvard University in 1870, and took a post-graduate course in philosophy there in 1874-1876; studied classical philology at Leipzig and Göttingen in 1876-1877; was tutor in Latin at Harvard from 1877 to 1880, and professor of Latin in Cornell University from 1880 to 1892, when he became professor of Latin and head of the Latin department of the University of Chicago. From 1894 to 1899 he was chairman and in 1893-1896 first director of the American School of Classical Studies at Rome. He is best known as an original teacher on questions of syntax. In The Cum-Constructions: Their History and Functions, which appeared in Cornell University Studies in Classical Philology (1888-1889; and in German version by Neizert in 1891), he attacked Hoffmann's distinction between absolute and relative temporal clauses as published in Lateinische Zeitpartikeln (1874); Hoffmann replied in 1891, and the best summary of the controversy is in Wetzel's Der Streit zwischen Hoffmann und Hale (1892). Hale wrote also The Sequence of Tenses in Latin (1887-1888), The Anticipatory Subjunctive in Greek and Latin (1894), and a Latin Grammar (1903), to which the parts on sound, inflection and wordformation were contributed by Carl Darling Buck.

Halebid, a village in Mysore state, southern India; pop. (1901), 1524. The name means "old capital," being the site of Dorasamudra, the capital of the Hoyasala dynasty founded early in the 11th century. In 1310 and again in 1326 it was taken and plundered by the first Mahommedan invader of southern India. Two temples, still standing, though never completely and greatly ruined, are regarded as the finest examples of the elaborately carved Chalukyan style of architecture.

Hale, John (1554-1656), English politician, was the son of Thomas Hales of Hales Place, Helden, Kent. He wrote his Highway to Nobility about 1543, and was the founder of a free school at Coventry for which he wrote Introductiones ad gramaticam. In political life Hales, who was member of parliament for Preston, was specially concerned with opposing the enclosures of land, being the most active of the commissioners appointed in 1548 to redress this evil; but he failed to carry several remedial measures through parliament. When the protector, the duke of Somerset, was deprived of his authority in 1550, Hales left England and lived for some time at Strassburg and Frankfort, returning to his own country on the accession of Elizabeth. However he soon lost the royal favour by writing a pamphlet, A Declaration of the Succession of the Crowne Imperiall of Inglande, which declared that the recent marriage between Lady Catherine Grey and Edward Seymour, earl of Hertford, was legitimate, and asserted that, failing direct heirs to Elizabeth, the English crown should come to Lady Catherine as the descendant of Mary, daughter of Henry VII. The author was imprisoned, but was quickly released, and died on the 30th of December 1551. The Discourse of the Common Wealth, described as "one of the most informing documents of the age," and written about 1549, has been attributed to Hales. This has been edited by E. Lamond (Cambridge, 1853).

Hales is often confused with another John Hales, who was clerk of the hanaper under Henry VIII. and his three immediate successors.

Hales, John (1584-1656), English scholar, frequently referred to as "the ever memorable," was born at Bath on the 19th of April 1584, and was educated at Corpus Christi College, Oxford. He was elected a fellow of Merton in 1605, and in 1612 he was appointed public lecturer on Greek. In 1613 he was made a fellow of Eton. Five years later he went to Holland, as chaplain to the English ambassador, Sir Dudley Carleton, who despatched him to Dort to report upon the proceedings of the synod then sitting. In 1619 he returned to Eton and spent his time among his books and in the company of literary men, among whom he was highly respected for his common sense, his erudition and his genial charity. Andrew Marvell called him "one of the clearest heads and best-prepared breasts in Christen-Charles II. in 1670. In June 1669 he was elected as a member of the Benet (now Corpus Christi) College, Cambridge, with the view of taking holy orders, and in February 1703 was admitted to a fellowship. He received the degree of master of arts in 1703 and of bachelor of divinity in 1711. One of his most intimate friends was William Stukeley (1687-1763) with whom he studied anatomy, chemistry, &c. In 1708-1709 Hales was presented to the perpetual curacy of Teddington in Middlesex, where he remained all his life, notwithstanding that he was subsequently appointed rector of Porlock in Somerset, and later of Parlingdon and the Mahommedan conquests and the treatment of the country of and by the English are described in the Royal Society, which awarded him the Copley medal in 1739. In 1732 he was named one of a committee for establishing a colony in Georgia, and the next year he received the degree of doctor of divinity from Oxford. He was appointed almoner to the princess-dowager of Wales in 1759. On the death of Sir Hans Sloane in 1753, Hales was chosen foreign associate of the French Academy of Sciences. He died at Teddington on the 4th of January 1761.

Hales is best known for his Statical Essays. The first volume, Vegetable Staticks (1717), contains an account of numerous experiments in plant-physiology—the loss of water in plants by evaporation, the rate of growth of shoots and leaves, variations in root-force at different times of the day, &c. Considering it very probable that plants draw "through their leaves some part of their nourishment from the air," he undertook experiments to show in "how great a proportion air is wrought into the composition of animal, vegetable and mineral substances"; though this "analysis of the air" did not lead him to any very clear ideas about the composition of the atmosphere, in the course of his inquiries he collected gases over water in vessels disparate from those in which they were generated, and thus used what was to all intents and purposes a "pneumatic trough." The second volume (1733) on Haemostatics, containing experiments...
on the “force of the blood” in various animals, its rate of flow, the capacity of the different vessels, &c., entitled him to be regarded as one of the originators of experimental physiology. But he did not confine his attention to abstract inquiries. The quest of a solvent for calculus in the bladder and kidneys was pursued by him as by others at the period, and he devised a form of forceps which, on the testimony of John Ranby (1703–1773), surgeon-surgeon to George II., extracted stones with “great ease and readiness.” His observations of the evil effect of vitiated air caused him to devise a “ventilator” (a modified organ-bellows) by which fresh air could be conveyed into gaols, hospitals, ships’-holds, &c.; this apparatus was successful in reducing the mortality in the Savoy prison, and it was introduced into France by the aid of H. L. Duhamel du Monceau. Among other things Hales invented a “sea-gauge” for sounding, and processes for distilling fresh from sea water, for preserving corn from weevils by fumigation with brimstone, and for salting animals whole by passing brine into their arteries. His Admonition to the Drinkers of Gin, Brandy, &c., published anonymously in 1734, has been several times reprinted.

HALESOWN, a market town in the Oldbury parliamentary division of Worcestershire, England, on a branch line of the Great Western and Midland railways, 64 m. W.S.W. of Birmingham. Pop. (1901), 4,037. It lies in a pleasant country among the eastern foothills of the Lickey Hills. There are extensive iron and steel manufactures. The church of SS Mary and John the Baptist, in which are the tombs of the Earls of Oxford and a branch of the Shenton family. It was consecrated in 1763 in the churchyard, has a memorial in the church. His delight in landscape-gardening is exemplified in the neighbouring estate of the Leasowes, which was his property. There is a grammar school founded in 1652, and in the neighbourhood is the Methodist foundation of Bourne College (1883). Close to the town, on the river Stour, which rises in the vicinity, are slight ruins of a Premonstratensian abbey of Early English date. Within the parish and 2 m. N.W. of Halesowen is Cradley, with iron and steel works, fire-clay works and a large nail and chain industry.

HALEVI, JUDAH BEN SAMUEL (c. 1085–1140), the greatest Hebrew poet of the middle ages, was born in Toledo c. 1085, and died in Palestine after 1140. In his youth he wrote Hebrew love poems of exquisite fancy, and several of his Wedding Odes are included in the liturgy of the Synagogue. The mystical connexion between maritual affection and the love of God had, in the view of older exegesis, already expressed itself in the scriptural Song of Songs and Judah Halevi used this book as his model. In this aspect of his work he found inspiration also in Arabic predecessors. The second period of his life, the Franciscan period, and the work of William Shenstone, buried in 1763 in the churchyard, has a memorial in the church. His delight in landscape-gardening is exemplified in the neighbouring estate of the Leasowes, which was his property. There is a grammar school founded in 1652, and in the neighbourhood is the Methodist foundation of Bourne College (1883). Close to the town, on the river Stour, which rises in the vicinity, are slight ruins of a Premonstratensian abbey of Early English date. Within the parish and 2 m. N.W. of Halesowen is Cradley, with iron and steel works, fire-clay works and a large nail and chain industry.

HALEVY, JACQUES FRANÇOIS FROMENTAL ÉLIE (1799–1862), French composer, was born on the 27th of May 1799, at Paris, of a Jewish family. He studied at the Paris Conservatoire under Berton and Cherubini, and in 1819 gained the grand prix de Rome with his cantata Hermine. In accordance with the wish which he devoted himself to the study of Italian music, and wrote an opera and various minor works. In 1827 his opera L’Arlesiana was played at the Colonne, the libretto, by Dumas, is, apparently without much success. Other works of minor importance, and now forgotten, followed, amongst which Manon Lescaut, a ballet, produced in 1830, deserves mention. In 1834 the Opéra-Comique produced L’Eclaire, the score of which had been begun by Hérold and had been completed by Halevy. In 1835 Halevy composed the tragic opera La Juive and the comic opera L’Éclaireur, and on these works his fame is mainly founded. The famous air of Eléazar and the anathema of the cardinal in La Juive soon became popular all over France. L’Éclaireur is a curiosity of musical literature. It is in two acts. The first, a long, and the second a short, opera, with a chorus, and displays the composer’s mastery over the most refined effects of instrumentation and vocalization in a favourable light. After these two works he wrote numerous operas of various genres, amongst which only La Reine de Chypre, a spectacular piece analyzed by Wagner in one of his Paris letters (1841), and La Tempête, in three acts, written for Her Majesty’s theatre, London (1850), need be mentioned. In addition to his productive work Halevy also rendered valuable services as a teacher. He was professor at the Conservatoire from 1827 till his death—some of the most successful amongst the younger composers. In France and Germany his name is linked with that of Bizet, the author of Carmen, being amongst his pupils. He was maestro al cembalo at the Théâtre Italien from 1820 to 1829; then director of singing at the Opera House in Paris until 1845, and in 1836 he succeeded Reicha at the Institut de France. Halevy also tried his hand at literature. In 1857 he became permanent secretary to the Académie des Beaux Arts, and there exists an agreeable volume of Souvenirs et portraits from his pen. He died at Nice, on the 17th of March 1862.
began a connexion which was to last over twenty years, and which proved most fruitful both for the reputation of the two authors and the prosperity of the minor Paris theatres. Their joint works may be divided into three classes: the opérantes, the farces, the comedies. The opérantes afforded excellent opportunities to a gifted musician for the display of his peculiar humour. They were broad and lively libels against the society of the time, but savoured strongly of the vices and follies they were supposed to satirize. Among the most celebrated works of the joint authors were La Belle Hélène (1864), Barbe Bleue (1866), La Grande Duchesse de Gerolstein (1867), and La Péరichole (1868). After 1870 the vogue of Parody rapidly declined. The decadence became still more apparent when Offenbach was no longer the sole architect of his musical irony, and when they had to deal with interpreters almost distained of singing powers. They wrote farces of the old type, consisting of complicated intrigues, with which they cleverly interwove the representation of contemporary whims and social oddities. They generally failed when they attempted comedies of a more serious character and tried to introduce a higher sort of emotion. A solitary exception must be made in the case of Frou-Frou (1869), which, owing perhaps to the admirable talent of Aimée Dumas, remains their unique gem. L'Abbe Halévy and Halévy will be found at their best in light sketches of Parisian life, Les Sonnettes, Le Roi Candide, Madame attend Monsieur, Voto che Toto. In that intimate association between the two men who had met so opportunely on the perron des variétés, it was often asked who was the leading partner. The question was not answered until the connexion was finally severed and they stood before the public, each to answer for his own work. It was then apparent that they had many gifts in common. Both had wit, humour, observation of character. Meilhac had a ready imagination, a rich and whimsical fancy; Halévy had taste, refinement and pathos of a certain kind. Not less clever than his brilliant comrade, he was more human. Of this he gave evidence in two delightful books, Monsieur et Madame Cardinal (1873) and Les Petites Cardinal, in which the lowest orders of the Parisian middle class are faithfully described. The pompous, pedantic, venomous Monsieur Cardinal will long survive as the true image of sententious and self-glorifying immorality. M. Halévy's peculiar qualities are even more visible in the simple and striking scenes of the Invasion, published soon after the conclusion of the Franco-German War, in Criquette (1883) and L'Abbé Constantin all are kind and good, and the change was eagerly welcomed by the public. Some enthusiasts still maintain that the Abbé will rank permanently in literature by the side of the equally chimerical Vicar of Wakefield. At any rate, it opened for M. Ludovic Halévy the doors of the French Academy, to which he was elected in 1884.

Halévy remained an assiduous frequenter of the Academy, the Conservatoire, the Comédie Française, and the Society of Dramatic Authors, but, when he died in Paris on the 8th of May 1908, he had produced practically nothing new for many years. His last romance, Kari Kari, appeared in 1892.

The Théâtre of MM. Meilhac and Halévy was published in 8 vols. (1900-1902).

HALFPENNY, WILLIAM, English 18th-century architectural designer—he described himself as “architect and carpenter.” He was also known as Michael Haore; but whether his real name was William Halpeny or Michael Haore is uncertain. His books, of which there are two, compendiums of Gothic and Swiss and Swiss and Gothic architecture, and especially with country houses in those Gothic and Chinese fashions which were so greatly in vogue in the middle of the 18th century. His most important publications, from the point of view of their effect upon taste, were New Designs for Chinese Temples, in four parts (1750-1752); Rural Architecture in the Gothic Taste (1752); Chinese and Gothic Architecture Properly Ornamented (1752); and Rural Architecture in the Chinese Taste (1750-1752). These four books were produced in collaboration with John Halpeny, who is said to have been his son. New Designs for Chinese Temples is a volume of some significance in the history of decoration; since, having been published some years before the books of Thomas Chippendale and Sir Thomas Chambers, it disproves the statement so often made that those designers introduced the Chinese taste into this country. Halpeny states distinctly that “the Chinese manner” had been “already introduced here with success.” The work of the Halpenyas was by no means all contemptible. It is sometimes distinctly graceful, but is marked by little originality.

HALFTIMBER WORK, an architectural term given to those buildings in which the framework is of timber with vertical studs and cross pieces filled between with brickwork, rubble masonry or plaster. The term is also occasionally used to define the timber filling or to the alternation of wood posts and the filling in, but the latter definition is that which is generally understood. The half-timber throughout England is of the most picturesque description, and the earliest examples date from towards the close of the 15th century. In the earliest example, Newgate House, York (c. 1450), the timber framing is raised over the ground floor. The finest specimen is perhaps that of Morton Old Hall, Cheshire (1570), where there is only a stone foundation about 12 in. high, and the same applies to Bramall Hall, near Manchester, portions of which are very early. Among other examples are Speke Hall, Lancashire; Park Hall, Shropshire (1533-1538); Hall i’th’ Wood, Lancashire (1591); St Peter’s Hospital, Bristol (1607); the Ludlow Feather’s Inn (1610); many of the streets at Chester and Shrewsbury; the Sparrowe’s Home, Ipswich; and Staple Inn, Holborn, from which in recent years the plaster coat which was put on many years ago has been removed, displaying the ancient woodwork. A similar fate has overtaken a very large number of half-timber buildings to keep out the driving winds; thus in Lewes nearly all the half-timbered buildings have either been filled in, or the combination of timber and plaster are the most characteristic features of the country.

HALFWAY COVENANT, an expedient adopted in the Congregational churches of New England between 1657 and 1662. Under its terms baptized persons of moral life and orthodox belief might receive the privilege of baptism for their children and other church benefits, without the full enrolment in membership which admitted them to the communion of the Lord’s Supper.

See CONGREGATIONALISM: American.
HALHED—HALICARNASSUS

HALHED, Nathaniel Brassey (1753–1830), English Orientalist and philologist, was born at Westminster on the 25th of May 1753. He was educated at Harrow, where he began his intimacy with Richard Brinsley Sheridan (see Sheridan Family) continued after he entered Christ Church, Oxford, where, also, he made the acquaintance of Sir William Jones, the famous Orientalist, who induced him to study Arabic. Accepting a readership in the service of the East India Company, Halhed went out to India in 1780, on the suggestion of Warren Hastings, by whose orders it had been compiled, translated the Gentoo code from a Persian version of the original Sanskrit. This translation was published in 1776 under the title A Code of Gentoo Laws. In 1778 he published a Bengali grammar, to print which he set up, at Hugli, the first press in India. It is claimed for him that he was the first writer to call attention to the philological connexion of Sanskrit with Persian, Arabic, Greek and Latin. In 1783 he returned to England, and from 1790–1795 was M.P. for Lymington, Hants. For some time he was a member of Richard Brothers (q.v.), and his unwise speech in parliament in defence of Brothers made it impossible for him to remain in the House, from which he resigned in 1795. He subsequently obtained a home appointment under the East India Company. He died in London on the 18th of February 1830.

His collection of Oriental manuscripts was purchased by the British Museum, and there is an unfinished translation by him of the Mahabharata, which is in the Library of the Asiatic Society of Bengal.

HALIBURTON, Thomas Chandler (1796–1863), British writer, long a judge of Nova Scotia, was born at Windsor, Nova Scotia, in 1796, and received his education there, at King's College. He was called to the bar in 1820, and became a member of the House of Assembly. He distinguished himself as a barrister, and in 1828 was promoted to the bench as a chief-justice of the common pleas. In 1829 he published An Historical and Statistical Account of Nova Scotia. But it is as a brilliant humourist and satirist that he is remembered, in connexion with his fictitious character “Sam Slick.” In 1833 he contributed anonymously to a local paper a series of letters profoundly depicting the peculiarities of the genuine Yankee. These sketches, which abounded in clever picturings of national and individual character, drawn with great satirical humour, were collected in 1837, and published under the title of The Clockmaker, or Sayings and Doings of Samuel Slick of Slickville. A second series followed in 1838, and a third in 1840. The Attaché, or Sam Slick in England (1843–1844), was the result of a visit there in 1841. His other works include: The Old Judge, or Life 30 ft. and 60 ft. (1843); Letters of the Great Western (1839); Rule and Mischief of the English in America (1851); Traits of American Humour (1852); and Nature and Human Nature (1855).

Meanwhile he continued to secure popular esteem in his judicial capacity. In 1840 he was promoted to be a judge of the supreme court; but within two years he resigned his seat on the bench, removed to England, and in 1859 entered parliament as the representative of Launceston, in the Conservative interest. But the tenure of his seat for Launceston was brought to an end by the dissolution of the parliament in 1865, and he did not again offer himself to the constituency. He died on the 27th of August of the same year, at Gordon House, Isleworth, Middlesex.

A memoir of Haliburton, by F. Blake Crofton, appeared in 1889.

HALIBUT, or Holibut (Hippoglossus vulgaris), the largest of all flat-fishes, growing to a length of 10 ft. or more, specimens of 5 ft. in length and of 100 lb. in weight being frequently exposed for sale in the markets. Indeed, specimens under 2 ft. in length are very rarely caught, and singularly enough, no instance is known of a very young specimen having been obtained. Small ones are commonly called “chicken halibut.” The halibut is much more frequent in the higher latitudes of the temperate zone than in its southern portion; it is a circumpolar species, being found on the northern coasts of America, Europe, and Asia, extending in the Pacific southwards to California. On the British coasts it keeps at some distance from the shore, and is generally caught in from 50 to 150 fathoms. Its flesh is generally considered coarse, but it is white and firm, and when properly served is excellent for the table. The name is derived from “holy” (M.E. haly), and recalls its use for food on holy days.

HALICARNASSUS (mod. Budrum), an ancient Greek city on the S.W. coast of Asia, Asia Minor, on a picturesque and advantageous site on the Ceramic Gulf or Gulf of Cos. It originally occupied only the small island of Zephyria close to the shore, now occupied by the great castle of St Peter, built by the Knights of Rhodes in 1404; but in course of time this island was united to the mainland and the city extended so as to incorporate Salmakis, an older town of the Leleges and Carian. About the foundation of Halicarnassus various traditions were current; but they agree in the main point as to its being a Dorian colony, and the figures on its coins, such as the head of Medusa, Athena and Poseidon, or the trident, support the statement that the mother cities were Troaden and Argos. The inhabitants appear to have accepted as their legendary founder Anthes, mentioned by Strabo, and were proud of the title of Antheadae. At an early period Halicarnassus was a member of the Doric Hexapolis, which included Cos, Cnidus, Lindus, Camirus and Ialysus; but one of the citizens, Agasicles, having taken home the prize tripod which he had won in the Triopian games instead of dedicating it according to custom to the Triopian Apollo, the city was cut off from the league. In the early 5th century Halicarnassus was under the sway of Artemisia, who made herself famous at the battle of Salamis, and Of Pisistratus, he then being the successor, little is known; but Lygdamis, who it attained to power, is notorious for having put to death the poet Panyasis and caused Herodotus, the greatest of Halicarnassians, to leave his native city (c. 457 B.C.). In the 5th cent. B.C. Halicarnassus and other Dorian cities of Asia were to some extent absorbed by the Delian League, but the peace of Antalcidas in 387 made them subservient to Persia; and it was under Mausolus, a Persian satrap who assumed independent authority, that Halicarnassus attained its highest prosperity. Struck by the natural strength and beauty of its position, Mausolus removed to Halicarnassus from Mitylæ, increasing the population of the city by the inhabitants of six towns of the Leleges. He was succeeded by Artemisia, whose military ability was shown in the stratagem by which she captured the Rhodian vessels attacking her city, and whose magnificence and taste have been perpetuated by the “Mausoleum,” the monument she erected to her husband’s memory (see MAUSOLUS). One of her successors, Pixodarus, tried to ally himself with the rising power of Macedon, and is said to have gained the momentary consent of the young Alexander to wed his daughter. The marriage, however, was forbidden by Philip, and the city, deprived of its patron, was occupied by the Romans, and once more summoned Halicarnassus, where Memnon, the paramount satrap of Asia Minor, had taken refuge with the Persian fleet, to surrender; and on its refusal took the city after hard fighting and devastated it, but not being able to reduce the citadel, was forced to leave it blockaded. He handed the government of the city back to the family of Mausolus, as represented by Ada, sister of the latter. Not long afterwards we find the citizens receiving the present of a gymnasium from Ptolemy, and building in his honour a stoa or portico; but the city never recovered altogether from the disasters of the siege, and Cicerone describes it as almost deserted. The site is now occupied in part by the town of Budrum; but the ancient walls can still be traced round nearly all their circuit, and the position of several of the temples, the theatre, and other public buildings can be fixed with certainty.

From the ruins of the Mausoleum sufficient has been recovered by the excavations carried out in 1857 by C. T. Newton to enable a fairly complete restoration of its design to be made. The building consisted of five parts—a basement or podium, a pteron or enclosure of colums, a pyramid, a pedestal and a chariot group. The basement, covering an area of 114 ft. by 22, was built of blocks of greenstone and capped with marble. Round the base of it were probably disposed groups of statuary. The
Halicz—Halifax, 1st Earl of

pterion consisted (according to Pliny) of thirty-six columns of the Ionic order, enclosing a square cela. Between the columns probably stood single statues. From the portions that have been recovered, it appears that the principal frieze of the pteron represented combats of Greeks and Amazons. In addition to these, there are also many life-size fragments of animals, horsemen, &c., belonging probably to pedimental sculptures, but formerly supposed to be parts of minor friezes. Above the pteron rose the pyramid, mounting by 24 steps to an apex or pedestal. On this apex stood the chariot, with the figure of Mausolus himself and an attendant. The height of the statue of Mausolus in the British Museum is 5 ft. 9½ in. without the plinth. The hair rising from the forehead falls in thick waves on each side of the face and descends nearly to the shoulder; the beard is short and close, the face square and massive, the eyes deep set under overhanging brows, the mouth well formed with settled calm about the lips. The drapery is grandly composed. All sorts of restorations of this famous monument have been proposed. The original one, made by Newton and Pullan, is obviously in error in many respects; and that of Oldfield, though to be preferred for its lightness (the Mausoleum was said anciently to be "suspended in mid-air"), does not satisfy the conditions postulated by the remains. The best on the whole is that of the veteran German architect, F. Adler, published in 1900; but fresh studies have since been made (see below).

Halicz, a town of Austria, in Galicia, 70 m. by rail S.S.E. of Lemberg. Pop. (1900), 4,809. It is situated at the confluence of the Luckow with the Dniestar and its principal resources are the recovery of salt from the neighbouring brine wells, soap-making and the trade in timber. In the neighbourhood are the ruins of the old castle, the seat of the ruler of the former kingdom from which Galicia derived its Polish name. Halicz, which is mentioned in annals as early as 1113, was from 1141 to 1255 the residence of the princes of that name, one of the principalities into which western Russia was then divided. The town was then much larger, as is shown by excavations in the neighbourhood made during the 19th century, and probably met its doom during the Mongol invasion of 1240. In 1349 it was incorporated in the kingdom of Poland.

Halifax, Charles Montague, Earl of (1661-1715), English statesman and poet, fourth son of the Hon. George Montague, fifth son of the first earl of Manchester, was born at Horton, Northamptonshire, on the 16th of April 1661. In his fourteenth year he was sent to Westminster school, where he was chosen king's scholar in 1677, and distinguished himself in the composition of extempore epi grams made according to custom upon theses appointed for king's scholars at the time of election. In 1679 he entered Trinity College, Cambridge, where he acquired a solid knowledge of the classics and surpassed all his contemporaries at the university in logic and ethics. Latterly, however, he preferred to the abstractions of Descartes the practical philosophy of Sir Isaac Newton; and he was one of the small band of students who assisted Newton in forming the Philosophical Society of Cambridge. But it was his facility in verse-writing, and neither his scholarship nor his practical ability, that first opened up to him the way to fortune. His clever but absurdly panegyric poem on the death of Charles II, secured for him the notice of the earl of Dorset, who invited him to town and introduced him to the principal wits of the time; and in 1687 his joint authorship with Prior of The Hind and Panther transverset to the Story of the Country Mouse and the City Cat, a parody of Dryden's political poem, not only increased his literary reputation but directly helped him to political influence.

In 1689, through the patronage of the earl of Dorset, he entered parliament as member for Maldon, and sat in the convention which resolved that William and Mary should be declared king and queen of England. About this time he married the countess-dowager of Manchester, and it would appear, according to Johnson, that it was still his intention to take orders; but after the coronation he purchased a clerkship to the council. On being introduced by Earl Dorset to King William, after the publication of his poetical Epistle occasioned by His Majesty's Victory in Ireland, he was ordered to receive an immediate pension of $200 per annum, until an opportunity should present itself of "making a man of him." In 1691 he was chosen chairman of the committee of the House of Commons appointed to confer with a committee of the Lords in regard to the bill for regulating trials in cases of high treason; and he displayed in these conferences such tact and debating power that he was made one of the commissioners of the treasury and called to the privy council. But his success as a politician was less due to his oratorical gifts than to his skill in finance, and in this respect he soon began to manifest such brilliant talents as completely eclipsed the painstaking abilities of Godolphin. Indeed it may be affirmed that no other statesman has initiated schemes which have left a more permanent mark on the financial history of England. Although perhaps it was inevitable that England should sooner or later adopt the continental custom of lightening the annual taxation in times of war by contracting a national debt, the actual introduction of the expedient was due to Montague, who on the 15th of December 1692 proposed to raise a million of money by way of loan. Previous to this the Scotsman William Paterson (c. 1658) had submitted to the government his plan of a national bank, and when in the spring of 1694 the prolonged contest with France had rendered another large loan absolutely necessary, Montague introduced a bill for the incorporation of the Bank of England. The bill after some opposition passed the House of Lords in May, and immediately after the prorogation of parliament Montague was rewarded by the chancellorship of the exchequer. In 1693 he was triumphantly returned for the borough of Westminster to the new parliament, and succeeded in passing his celebrated measure to remedy the depreciation which had taken place in the currency on account of dishonest manipulations. To provide for the expense of recoinage, Montague, instead of reviving the old tax of hearth money, introduced the window tax, and the difficulties caused by the temporary absence of a metallic currency were avoided by the issue for the first time of exchequer bills. His other expedients for meeting the emergencies of the financial crisis were equally successful, and the rapid restoration of public credit secured him a commanding influence both in the House of Commons and at the board of the treasury; but although Godolphin resigned office in October 1696, the king hesitated for some time between Montague and Sir Stephen Fox as his successor, and it was not till 1697 that the former was appointed first lord. In 1697 he was accused by Charles Duncombe, and in 1698 by a Col. Granville, of fraud, but both charges broke down, and Duncombe was shown to have been guilty of extreme dishonesty himself. In 1698 and 1699 he acted as one of the council of regency during the king's absence from England. With the accumulation of his political successes his vanity and arrogance became, however, so offensive that latterly they utterly lost him the influence he had acquired by his administrative ability and his masterly eloquence; and when his power began to be on the wane he set the seal to his political overthrow by conferring the lucrative sinecure office of auditor of the exchequer on his brother in trust for himself should he be compelled to retire from power. This action earned him the offensive nickname of "Fitcher," and for some time afterwards, in attempting to lead the House of Commons, he had to submit to constant mortifications, often verging on personal insults. After the return of the king in 1699 he resigned his offices in the government and succeeded his brother in the auditorship.
Somers and the earls of Portland and Oxford, but all the charges were dismissed by the Lords; and in 1703 a second attempt to impeach him was still more unsuccessful. He continued out of office during the reign of Queen Anne, but in 1706 he was named one of the commissioners to negotiate the union with Scotland; and after the passing of the Act of Settlement in favour of the house of Hanover, he was appointed ambassador to the elector's court to convey the insignia of order of the garter to George I. On the death of Anne (1714) he was appointed one of the council of regency until the arrival of the king from Hanover; and after the coronation he received the office of first lord of the Treasury and, in the latter part of his life, that of the first Lord of the Treasury at the court of Hanover and Viscount Sunbury. He died on the 19th of May 1715 and left no issue. He was buried in the vault of the Albemarle family in Westminster Abbey. His nephew George (d. 1739) succeeded to the barony, and was created Viscount Sunbury and earl of Halifax in 1715.

Montague's association with Prior in the travesty of Dryden's *Hind and Panther* has no doubt largely aided in preserving his literary reputation; but he is perhaps indebted for it chiefly to his subsequent influential position and to the fulsome flattery of Steele and Prior. On his return for his liberal donations and the splendid banquet which they occasionally enjoyed at his villa on the Thames, "fed him," as Pope says, "all day long with dedications." Swift says he gave them nothing but "good words, and good dinners." That, however, his beneficence to needy talent, if sometimes attributable to an itching ear for adulation, was at others prompted by a sincere appreciation of intellectual merit, is sufficiently attested by the manner in which he procured from Godolphin a commissionship for Addison, and also by his lifelong intimacy with Newton, for whom he obtained the mastership of the mint. The small fragments of poetry which he left behind him, and which were almost solely the composition of his early years, display a certain facility and vigour of diction, but their thought and fancy are never more than commonplace, and not unfrequently in striving to be eloquent and impressive he is only grotesquely and extravagantly absurd. In administrative talent he was the superior of all his contemporaries, and his only rival in parliamentary eloquence was Somers; but the skill with which he managed measures was superior to his powers of oratory. The influence of his brilliant financial successes on his reputation was gradually almost nullified by the affected arrogance of his manner and by the eccentricities of his sensitive vanity. So eager latterly was his thirst for fame and power that perhaps Marlborough did not exaggerate when he said that "he had no other principle but his ambition, so that he would put all in distraction rather than not gain his point."

Among the numerous notices of Halifax by contemporaries may be mentioned the eulogistic reference which concludes Addison's account of the "greatest of English poets"; the dedications by Steele to the second volume of the *Spectator* and to the fourth of the *Tatler*; Pope's laudatory mention of him in the epilogue to his *Sotos* and in the preface to the *Iliad*, and his portrait of him as "Full-blown Bufo" in the *Epistle to Arbuthnot*. Various allusions to him are to be found in Swift's works and in Marlowe's *Letters*. See also Burnett's *History of his Own Times; The Parliamentary History*; Hoole's *State Trials; Johnson's Lives of the Poets;* and Macaulay's *History of England*. His Miscellaneous Works were published at London in 1704; his *Life and Miscellaneous Works* in 1715 and his *Poetical Works*, to which also his "Life" is attached, in 1716. His poems were reprinted in the 9th volume of Johnson's *English Poets*.

**HALIFAX, GEORGE MONTAGU DUNK, 2nd EARL OF (1716–1771)**; son of George Montagu, 1st Earl of Halifax (of the second creation), was born on the 5th or 6th of October 1716, becoming earl of Halifax on his father's death in 1730. Educated at Eton and at Trinity College, Cambridge, he was married in 1741 to Anne Richards (d. 1753), a lady who had inherited a great fortune from Sir Thomas Dunk, whose name was taken by Halifax. After having been an official in the household of Frederick, prince of Wales, the earl was made master of the buckhounds, and in 1748 he became president of the Board of Trade. While filling this position he helped to found Halifax, the capital of Nova Scotia, which was named after him, and in several ways he rendered good service to trade, especially with North America. About this time he sought to become a secretary of state, but in vain, although he was allowed to enter the cabinet in 1757. In March 1761 Halifax was appointed lord-lieutenant of Ireland, and during part of the time which he held this office he was also first lord of the admiralty. He became secretary of state for the northern department under the earl of Bute in October 1762, retaining this post under George Grenville and being one of the three ministers to whom George III. entrusted the direction of affairs after the fall of Bute in 1763 and the fall of Wilkes in 1763, for which action he was mulcted in damages by the courts of law in 1760, and he was mainly responsible for the exclusion of the name of the king's mother, Augusta, princess of Wales, from the Regency Bill of 1765. With his colleagues the earl left office in July 1765, returning to the cabinet as lord privy seal under his nephew, Lord North, in January 1770. He had just been transferred to his former position of secretary of state when he died on the 8th of June 1772. Halifax, who was lord-lieutenant of Northamptonshire and a lieutenant-general in the army, showed a disinterestedness in money matters, but was very extravagant. He left no children, and his titles became extinct on his death, Horace Walpole speaks slightly of the earl, and says he and his mistress, Mary Anne Faulkner, "had sold every employment in his gift."

See the *Memoirs* of his secretary, Richard Cumberland (1807).

**HALIFAX, GEORGE SAVILE, 1ST MARQUIS OF (1633–1695)**, English statesman and writer, great-grandson of Sir George Savile of Lupset and Thornhill in Yorkshire (created baronet in 1611), was the eldest son of Sir William Savile, 3rd baronet, who had distinguished himself in the civil war in the royalist cause and was created a baronet in 1644, and of Anne, eldest daughter of Lord Keeper Coventry. He was thus nephew of Sir William Coventry, who is said to have influenced his political opinions, and of Lord Shaftesbury, afterwards his most bitter opponent, and great-nephew of the earl of Strafford; by his marriage with the Lady Dorothy Spencer, he was brother-in-law to Lord Sunderland. He entered public life with all the advantages of lineage, political connexions, great wealth and estates, and uncommon abilities. He was elected member of the Convention parliament for Pontefract in 1660, and this was his only appearance in the Lower House. A peerage was sought for him by the duke of York in 1665, but was successfully opposed by Clarendon, on the ground of his "ill-reputation amongst men of piety and religion," the real motives of the chancellor's hostile attitude being probably Savile's connexion with Buckingham and Coventry. The honours were, however, only deferred for a short time and were obtained after the fall of Clarendon on the 31st of December 1667, when Savile was created Baron Savile of Eland and Viscount Halifax.

He supported zealously the anti-French policy formulated in the Triple Alliance of January 1668. He was at this time in favour at court, was created a privy councillor in 1672, and, while ignorant of the disgraceful secret clauses in the treaty of Dover, was chosen envoy to negotiate terms of peace with Louis XIV. and the Dutch at Utrecht. His mission was still further deprived of importance by Arlington and Buckingham, who were in the king's counsels, and who anticipated his arrival and took the negotiations out of his hands; and though he signed the compact, he had no share in the harsh terms imposed upon the Dutch, and henceforth became a bitter opponent of the agreement, not only because of his adherence to French interests and of the Roman Catholic claims.

He took an active part in passing through parliament the great Test Act of 1673 and forfeited in consequence his friendship with James. In 1674 he brought forward a motion for

---

disarming "popish recusants," and supported one by Lord Carlisle for restricting the marriages in the royal family to Protestants; but he opposed the bill introduced by Lord Danby (see Leeds, 1st Duke 09) in 1675, which imposed a test oath on officials and members of parliament, speaking "with that quickness, learning and spirit" that "caused the Chamber to kick at it;" and ridiculing the multiplication of oaths, since "no man would ever sleep with open doors...should all the town be sworn not to rob." He was now on bad terms with Danby, and a witty salat at that minister's expense caused his dismissal from the council in January 1676. In 1678 he took an active part in the investigation of the "Popish Plot," to which he appears to have given excessive credence, but opposed the bill which was passed on the 30th of October 1678, to exclude Roman Catholics from the House of Lords.

In 1679, as a consequence of the fall of Danby, he became a member of the newly constituted privy council. With Charles, who had at first "kicked at his appointment," he quickly became a favourite, his lively and "libertine" (i.e. free or sceptical) conversation being named by Bishop Burnet as his chief attraction for the king. His dislike of the duke of York and of the Romanist tendencies of the court did not induce him to support the rash attempt of Lord Shaftesbury to substitute the illegitimate duke of Monmouth for James in the succession. He feared Shaftesbury's ascendency in the national councils and foresaw nothing but civil war and confusion as a result of his scheme. He declared against the exclusion of James, was made an earl in 1679, and was one of the "Triumvirate" which now directed public affairs. He assisted in passing into law the Hab敛 Corpus Bill. According to Sir W. Temple he showed great severity in putting into force the laws against the Roman Catholics, but this statement is considered a misrepresentation.1

In 1680 he voted against the execution of Lord Stafford.

Meanwhile (1679) his whole policy had been successfully directed towards uniting all parties with the object of frustrating Shaftesbury's unconstitutional proposals. He were opened with the prince of Orange, and the illness of the king was made the occasion for summoning James from Brussels. Monmouth was compelled to retire to Holland, and Shaftesbury was dismissed. On the other hand, while Halifax was so far successful, James was given an opportunity of establishing a new influence at the court. It was with great difficulty that his retirement to Scotland was at last effected; the ministers lost the confidence and support of the country party, and Halifax, fatigued and ill, at the close of the year, retired to Ruford Abbey, the country home of the Savilles since the destruction of Thornhill Hall in 1648, and for some time took little part in affairs. He returned in September 1680 on the occasion of the introduction of the Exclusion Bill in the Lords. The debate which followed, one of the most famous in the whole annals of parliament, became a duel of oratory between Halifax and his uncle Shaftesbury, the finest two speakers of the day, watched by the Lords, the Commons at the bar, and the king, who was present. It lasted seven hours. Halifax spoke sixteen times, and at last, regardless of the menaces of the more violent supporters of the bill, who closed round him, vanquished his opponent. The rejection of the bill by a majority of 33 was attributed by all parties entirely to the eloquence of Halifax. His conduct transformed the allegiance to him of the Whigs into bitter hostility, the Commons immediately petitioning the king to remove him from his councils for ever, while any favour which he might have regained with James was forfeited by his subsequent approval of the regency scheme.

He returned to Ruford again in January 1681, but was present at the Oxford parliament, and in May returned suddenly to public life and held for a year the chief control of affairs. The arrest of Shaftesbury on the 2nd of July was attributed to his influence, but in general, during the period of Tory reaction, he seems to have urged a policy of conciliation and moderation upon the king. He opposed James's return from Scotland and, about this time (Sept.), made a characteristic but futile attempt to persuade the duke to attend the services of the Church of England and thus to end all difficulties. He renewed relations with the prince of Orange, who in July paid a visit to England to seek support against the French designs upon Luxembourg. The influence of Halifax procured for the Dutch a formal promise of support. He opposed the king's suggestion that the king, informed the French ambassador that he had no intention of fulfilling his engagements, and made another secret treaty with Louis. Halifax opposed in 1682 James's vindictive prosecution of the earl of Argyll, arousing further hostility in the duke, while the same year he was challenged to a duel by Monmouth, who attributed to him his disgrace.

His short tenure of power ended with the return of James in May. Outwardly he still retained the king's favour and was advanced to a marquisate (Aug. 17) and to the office of lord privy seal (Oct. 25). Being still a member of the administration he must share responsibility for the attack now made upon the municipal franchises, a violation of the whole system of representative government, especially as the new charters passed his office. In January 1684 he was one of the commissioners "who supervise all things concerning the city and have turned out those persons who are whiggishly inclined." (N. Luttrell's Diary, i. 205.) He made honourable but vain endeavours to save Algernon Sidney and Lord Russell. "My Lord Halifax," declared Yellotson in his evidence before the later inquiry, "showed a very compassionate concern for Lord Russell and all the readiness to serve them that could be wished."2 The Rye-House Plot, in which it was sought to implicate them, was a disastrous blow to his policy, and in order to counteract its consequences he entered into somewhat perilous negotiations with Monmouth, and endeavoured to effect his reconciliation with the king. On the 12th of February 1684, he procured the release of his old antagonist, Lord Danby. Shortly afterwards his influence at the court revived. Charles was no longer in receipt of his French pension and was beginning to feel the pinch of money. The new lord treasurer, was, according to the epigram of Halifax which has become proverbial, "kicked upstairs," to the office of lord president of the council. Halifax now worked to establish intimate relations between Charles and the prince of Orange and opposed the abrogation of the recusancy laws. In a debate in the cabinet of November 1684, on the question of the grant of a fresh constitution to the New England colonies, he urged with great warmth that "there could be no doubt whatever but that the same laws which are in force in England should also be established in a country inhabited by Englishmen and that an absolute government is neither so happy nor so safe as that which is tempered by laws and which sets bounds to the authority of the prince," and declared that he could not "live under a king who should have it in his power to take, whenever he thought proper, the money he has in his pocket." The opinions thus expressed were opposed by all the other ministers and highly censured by Louis XIV., James and Judge Jeffreys.

At the accession of James he was immediately deprived of all power and relegated to the presidency of the council. He showed no compliance, like Sir Lovelace, with James's Roman Catholic preferences. He was opposed to the parliamentary grant to the king of a revenue for life; he promoted the treaty of alliance with the Dutch in August 1685; he expostulated with the king on the subject of the illegal commissions in the army given to Roman Catholics; and finally, on his firm refusal to support the repeal of the Test and Hab敛 Corpus Acts, he was dismissed, and his name was struck out of the list of the privy council (Oct. 1685). He corresponded with the prince of Orange, conferred with Dutch ministers, and, instead of from plans which aimed at the prince's personal interference in English affairs. In 1687 he published the famous Letter to a Dissenter, in which he warns the Nonconformists against being beguiled by the "indulgence" into joining the court party, sets in a clear light the fatal results of such a step, and reminds them that under their next sovereign their grievances would in

all probability be satisfied by the law. The tract, which has received general and unqualified admiration, must be classed amongst the few known writings which have actually and immediately altered the course of history. Copies to the number of 20,000 were circulated through the kingdom, and a great party was convinced of the wisdom of remaining faithful to the national tradition. Yet the legality of the act was never disputed. In the deliberation on the trial of the bishops in June 1688, visited them in the Tower, and led the cheers with which the verdict of "not guilty" was received in court; but the same month he refrained from signing the invitation to William, and publicly repudiated any share in the prince's plans. On the contrary he attended the court and refused any credence to the report that the prince was now for the supposititious. After the landing of William he was present at the council called by James on the 27th of November. He urged the king to grant large concessions, but his speech, in contrast to the harsh and overbearing attitude of the Hydes, was "the most tender and obliging... that ever was heard." He accepted the mission with Nottingham and Godolphin to treat with William at Hungerford, and succeeded in obtaining moderate terms from the prince. The negotiations, however, were abortive, for James had from the first resolved on flight. In the crisis which ensued, when the country was left without a government, Halifax took the lead. He presided over the council of Lords which assembled and took immediate measures to maintain public order. On the return of James to London on the 16th of November, after his capture at Faversham, Halifax repaired to William's camp and henceforth attached himself unremittingly to his cause. On the 17th he carried with Lords Delamere and Shrewsbury a message from William to the king advising his departure from London, and, after the king's second flight, directed the proceedings of the executive. On the meeting of the convention on the 22nd of January 1689, he was formally elected speaker of the House of Lords. He voted against the motion for a regency (Jan. 20), which was only defeated by two votes. The munificent and comprehensive character of the settlement at the revolution plainly shows his guiding hand, and it was finally through his persuasion that the Lords yielded to the Commons and agreed to the compromise whereby William and Mary were declared joint sovereigns. On the 13th of February in the Banqueting House at Whitehall, he tendered the crown to them in the name of the nation, and conducted the proclamation of their accession in the city.

At the opening of the new reign he had considerable influence, was made lord privy seal, while Danby his rival was obliged to content himself with the presidency of the council, and controlled the appointments to the new cabinet which were made on a "trimming" or comprehensive basis. His views on religious toleration were as wide as those of the new king. He championed the claims of the Nonconformists as against the high or rigid Church party, and he was bitterly disappointed at the miscarriage of the Comprehension Bill. He thoroughly approved also at first of William's foreign policy; but, having excited the hostility of both the Whig and Tory parties, he now became exposed to a series of attacks in parliament which finally drove him from power. He was severely censured, as it seems quite unjustly, for the disorder in Ireland, and an attempt was made to impeach him for his conduct with regard to the sentences on the Whig leaders. The inquiry resulted in his favour; but notwithstanding, and in spite of the king's continued support, he determined to retire. He had already resigned the speakership of the House of Lords, and he now (Feb. 8, 1690) quitted his place in the cabinet. He still nominally retained his seat in the privy council, but in parliament he became a bitter critic of the administration; and the rivalry of Halifax (the Black Marquess) with Danby, now marquess of Carmarthen (the White Marquess) threw the former at this time into determinate opposition. He disapproved of William's total absorption in European politics, and his open partiality for his countrymen. In January 1691 Halifax had an interview with Henry Bulkeley, the Jacobite agent, and is said to have promised to do everything that lay in his power to serve the king. This was probably merely a measure of precaution, for he had no serious Jacobite leanings. He entered bail for Lord Marlborough, accused wrongfully of complicity in a Jacobite plot in May 1692, and in June, during the absence of the king from England, his name was struck off the council.

He spoke in favour of the Triennial Bill (Jan. 12, 1693) which passed the legislature but was vetoed by William, suggested a proviso in the Licensing Act, which restricted its operation to anonymous works, approved the Place Bill (1694), but opposed, probably on account of the large sums he had engaged in the traffic of annuities, the establishment of the bank of England in 1694. Early in 1695 he delivered a strong attack on the administration in the House of Lords, and, after a short illness arising from a neglected complaint, he died on the 5th of April at the age of sixty-one. He was buried in Henry VII's chapel in Westminster Abbey.

The influence of Halifax, both as orator and as writer, on the public opinion of his day was probably unrivalled. His intellectual powers, his high character, his urbanity, vivacity and satirical humour made a great impression on his contemporaries, and many of his witty sayings have been recorded. But the superiority of his statesmanship could not be appreciated till later times. Maintaining throughout his career a complete detachment from party, he never acted permanently or continuously with either of the two great factions, and exasperated both in turn by deserting their cause at the moment when their hopes seemed on the point of realization. To them he appeared weak, inconstant, untrustworthy. They could not see what to us now is plain and clear, that Halifax was as consistent in his principles as the most rabid Whig or Tory. But the principle which chiefly influenced his political action, that of compromise, differed essentially from those of both parties, and his attitude with regard to the Whigs or Tories was thus by necessity continually changing. Measures, too, which in certain circumstances appeared to be desirable when the political scene had changed became unwise or dangerous. Thus the regency scheme, which Halifax had supported while Charles still reigned, was opposed by him with perfect consistency at the revolution. He readily accepted for himself the character of a "trimmer," desiring, he said, to keep the boat steady, while others attempted to weigh it down perilously on one side or the other; and he concluded his tract with these assertions: "that our climate is a Trimmer between that part of the world where men are roasted and the other where they are frozen; that our Church is a Trimmer between the frenzy of fanatic visions and the lethargic ignorance of Popish dreams; that our laws are Trimmers between the excesses of unbounded power and the extravagance of liberty not enough restrained; that true virtue hath ever been thought a Trimmer, and to have its dwelling in the middle between two extremes; that even God Almighty Himself is divided between His two great attributes, His Mercy and His Justice. In such company, our Trimmer is not ashamed of his name. . . ."

His powerful mind enabled him to regard the various political problems of his time from a height and from a point of view similar to that from which distance enables us to consider them at the present day; and the superiority of his vision appears sufficiently from the fact that his opinions and judgments on the political questions of his time are those which for the most part have ultimately triumphed and found general acceptance. His attitude of mind was curiously modern. Reading, writing and arithmetic, he thinks, should be taught to all and at the expense of the state. His opinions again on the constitutional relations of the colonies to the mother country, already cited, were completely opposed to those of his own period. For that view of his character which while allowing him the merit of a brilliant political theorist denies him the qualities of a man of action and of a practical politician, there is no solid basis. The truth is that while his political ideas are founded upon great moral or philosophical generalizations, often vividly

---

1 Character of a Trimmer, conclusion.
2 Savilliana quoted by Foxcroft i. 115.
recalling and sometimes anticipating the broad conceptions of Burke, they are at the same time imbued with precisely those practical qualities which have ever been characteristic of English statesmanship, and were always capable of application to actual conditions. He was no star-gazing philosopher, with thoughts superior to the contemplation of mundane affairs. He had no taste for abstract political dogma. He seems to venture no further than to think that "men should live in some competent state of freedom," and that the limited monarchical and aristocratical government was the best adapted for his country. "Circumstances," he writes in the Rough Draft of a New Model at Sea, "must come in and be made into a part of the little of which I want. Positive decisions are always dangerous, more especially in politics." Nor was he the mere literary student buried in books and in contemplative ease. He had none of the "indiscreetness which commonly renders literary men of no use in the world" (Sir John Dalrymple). The incidents of his career show that there was no backwardness or hesitation in acting when occasion required. The constant tendency of his mind towards antagonism and the balancing of opinions did not lead to paralysis in time of action. He did not shrink from responsibility, nor show on that account any lack of courage. At various times he proved himself a great leader, and when he returned to public life to defeat the Exclusion Bill. At the revolution it was Halifax who seized the reins of government, flung away by James, and maintained public security. His subsequent failure in collaborating with William is, it is true, disappointing. But the cause was one that has not perhaps received sufficient attention. Party government had come to the birth during the struggles over the Exclusion Bill, and there had been unconsciously introduced into politics a novel element of which the nature and importance were not understood or suspected. Halifax had consistently ignored and neglected the party; and it now had its revenge. Detested by the Whigs and by the Tories alike, and defended by neither, the favour alone of the king and his own transcendent abilities proved insufficient to withstand the constant and violent attacks made upon him in parliament, and he yielded to the superior force. He seems indeed himself to have been at last convinced of the necessity in English political life of party government, for though in his Considerations to electors he warms them against men "tied to a party," yet in his last words he declares: "If there are two parties a man ought to adhere to that which be his native habit."

The character of Halifax was that of a great politician of the first order. He was a writer of fine profane epigrams, a man of great ability, and, according to his own account, he was "a witty gentle-

man, if not a little too prompt and daring." The latter characteristic was not moderated by time but remained throughout life. He was incapable of controlling his spirit of raillery, from jests on Siamese missionaries to sarcasms at the expense of the heir to the throne and ridicule of hereditary monarchy, and his brilliant paradoxes, his pungent and often profane epigrams were received by graver persons as his real opinions and as evidences of atheism. This latter charge he repudiated, assuring Burnet that he was "a Christian in submission," but that he could not digest iron like an ostrich nor swallow all that the divines sought to impose upon the world.

The political opinions of Halifax have not been preserved, and his political writings on this account have all the greater value. The Character of a Trimmer (1684 or 1685), the authorship of which, long doubtful, is now established, was his most ambitious production, written seemingly as advice to the king and as a manifesto of his own opinions. In it he discusses the political problems of the time and their solution on broad principles. He supports the Test Act and, while opposing the Indulgence, is not hostile to the repeal of the penal laws against the Roman Catholics by parliament. Turning to foreign affairs he contemplates with admiration the growing power of France and the continuance of the war as a Baedeker at the sight of the "Roses blasted and discoloured while little triumph and great insolent upon the comparison." The whole is a masterly and comprehensive summary of the actual political situation and its exigencies; while, when he treats such themes as liberty, or discusses the balance to be maintained between freedom and government in the constitution, he rises to the political idealism of Bolingbroke and Burke, The Character of King Charles II. (printed 1790), to be compared with his earlier sketch of the king in the Character of a Trimmer, is perhaps from the literary point of view the most admirable of his writings. The famous Letter to a Dissenter (1697) was thought by Sir James Mackintosh to be unrivalled as a political pamphlet. The Lady's New Year's Gift: or Advice to a Daughter, refers to his daughter Elizabeth, afterwards wife of the 3rd and mother of the celebrated 4th Earl of Chesterfield (1688). In The Anatomy of an Equivalent (1688) he treats with keen wit and power of analysis the proposal to grant a "perpetual edict" in favour of the Established Church in return for the repeal of the test and penal laws. Maxims of State appeared about 1693. The Rough Draft of a New Model at Sea (n.d.), a collection of aphorisms in the style of the maxims of La Rochefoucauld, inferior in style—but greatly excelling the French author in breadth of view and in moderation. (For other writings attributed to Halifax, see Foxcroft, Life of Sir G. Savile, p. 159 seq.).

Halifax was twice married, first in 1656 to the Lady Dorothy Spencer, daughter of the 1st earl of Sunderland and of Lady Dorothy Sidney, "Sacharias," who died in 1670, leaving a family; and secondly, in 1672, to Gertrude, daughter of William Pierpoint of Thorsey, who survived him, and by whom he had one daughter, Elizabeth, Lady Chesterfield, who seems to have inherited a considerable portion of her father's intellectual abilities. On the death of his son William, 2nd marquess of Halifax, in August 1700 without male issue, the peerage became extinct, and the baronetcy passed to the Saviles of Lupset, the whole

male line of the Savile family ending in the person of Sir George Savile, 8th baronet, in 1784. Henry Savile, British envoy at Versailles, who died unmarried in 1687, was a younger brother of the first marquess. Halifax has been generally supposed to have been the father of the illegitimate Henry Carey, the poet, but this is doubtful.

See Life and Letters of Sir George Savile, 1st Marquis of Halifax (4 vols., 1827), by Miss H. C. Blyth. It is an excellent collection of all the materials available at that date, including hitherto unexplored Savile MSS., at Devonshire House, in the Spencer Archives, in the Longleat and other collections, and shows, in fact, what industrial interest in a marquis of Halifax's time, and pronounced him on a well-merited and eloquent eulogy (iv. 549). Contemporary characters of Halifax which must be accepted with caution are Burnet's in the History of His Own Times (ed. 1833, vol. 1. pp. 491-493, and iv. 268), that by the author of "Savilianal," identified as William Monpesson, and "Saccom Apollinar," a panegyric verse by Elkana Settle (1695).

HALIFAX, a city and port of entry, capital of the province of Nova Scotia, Canada. It is situated in 44° 59′ N. and 63° 35′ W., on the south-east coast of the province, on a fortified hill, 225 ft. in height, which slopes down to the waters of Chebucto Bay, now known as Halifax Harbour. The harbour, which is open all the year, is about 6 m. long by 1 m. in width, and has excellent anchorage in all parts; to the north a narrow passage connects it with Bedford Basin, 6 m. in length by 4 m., and deep enough for the largest men-of-war. At the harbour mouth lies McNab's Island, thus forming two entrances to the western sea. In 1862 the Confederate cruiser, "Tallahassee," was driven through by night, and escaped the northern vessels which were watching off the western entrance. The population in 1901 was 40,832.

The town was originally built of wood, plastered or stuccoed, but though the wooden houses largely remain, the public buildings are of stone. Inferior in natural strength to Quebec alone, the city and its approaches have been fortified till it has become the strongest position in Canada, and one of the strongest in the British Empire. Till 1706 it was garrisoned by British troops, and in that year, with Esquimalt, on the Pacific coast, it was taken over by the Canadian government, an operation necessitating a large increase in the Canadian permanent military force. At the same time, the royal dockyard, containing a dry-dock 610 ft. in length, and the residences in connexion, were also taken over for the use of the department of marine and fisheries. Till 1905 Halifax was the summer station of the British North American squadron. In that year, in consequence of a redistribution of the fleet, the permanent North American squadron was withdrawn; but Halifax is still visited periodically by passes of the fleet.

Though, owing to the growth of Sydney and other outports, it no longer monopolizes the foreign trade of the province, Halifax is still a thriving town, and has the largest export trade of the Dominion in fish and fish products, the export of fish alone, in 1904, amounting to over three-fifths of that of the entire Dominion. Lumber (chiefly spruce deals) and agricultural products (especially apples) are also exported in large quantities. The chief imports are manufactures from Great Britain and the United States, and sugar, molasses, rum and fruit from the West Indies. Its industrial establishments include sugar refineries, manufactures of furniture and other articles of wood, a skate factory and rope and cordage works, the produce of which are all exported. It is the Atlantic terminus of the Intercolonial, Canadian Pacific and several provincial railways, and the chief winter port of Canada, numerous steamship lines connecting it with Great Britain, Europe, the West Indies and the United States. The public gardens, covering 14 acres, and Point Pleasant Park, left to a great extent in its natural state, are extremely beautiful. Behind the city is an arm of the sea (known as the North Arm) on which has come the grown with high, well-wooded shores, and covered in summer with canoes and sailing craft. The educational institutions include a ladies' college, several convicts, a Presbyterian theological college and Dalhousie University, with faculties of arts, law, medicine and science. Established by charter in 1818 by the earl of Dalhousie, then lieutenant governor, and reorganized in 1863, it has since become the most important seat of learning in the maritime provinces. Other prominent buildings are Government House, the provincial parliament and library, and the Roman Catholic cathedral. St. Paul's church (Anglican) dates from 1750, and though not striking architecturally, is interesting from the memorial tablets and the graves of celebrated Nova Scotians which it contains. The city is the seat of the Anglican bishop of Nova Scotia and Prince Edward Island, and of the Roman Catholic bishop of Halifax.

Founded in 1749 by the Hon. Edward Cornwallis as a rival to the French town of Louisburg in Cape Breton, it was named after the 2nd earl of Halifax, president of the board of trade and plantations. In the following year it superseded Annapolis as capital of the province. Its privateers played a prominent part in the second of the Early English period. The old woodwork is fine, part being Perpendicular, but the greater portion dates from 1621. All Souls' church was built in 1850 from the designs of Sir Gilbert Scott, of whose work it is a good example, at the expense of Mr Edward Akroyd. The style is Early Decorated, and a rich ornamentation is carried out in Italian marble, serpentine and alabaster. A graceful tower and spire 236 ft. high rise at the north-west angle. The Square chapel, erected by the Congregationalists in 1837, is a striking cruciform building with a tower and elaborate crocketed spire. Both the central portion of the nave and the eastern end of the church are elaborately decorated with carved and stained glass.

Among charitable institutions the principal is the handsome royal infirmary, a Renaissance building. The Heath grammar school was founded in 1783 under royal charter for instruction in classical languages. It possesses close scholarships at Oxford and Cambridge universities. The Waterhouse charity school occupies a handsome set of buildings forming three sides of a quadranl, erected in 1854. The Crossley almshouses were erected and endowed by Sir Francis and Mr Joseph Crossley, who also endowed the Crossley orphan home and school. Technical schools are maintained by the corporation. Among other public buildings may be noted the Piece-Hall, erected in 1790 for the lodging and sale of piece goods, now used as a market, a great quadrangular structure occupying more than two acres; the banding warehouse, court-house, and mechanics' institute. There are six parks, of which the People's Park of 123 acres, presented by Sir Francis Crossley in 1858, is laid out in ornate style from designs by Sir Joseph Paxton. Halifax ranks with Leeds, Bradford and Huddersfield as a seat of the woolen and worsted manufacture. The manufacture of carpets is a large industry. The establishment employing some
5000 hands. The worsted, woolen and cotton industries, and the iron, steel and machinery manufactures are very extensive. There are collieries and freestone quarries in the neighbourhood.

The parliamentary borough returns two members. The county borough was created in 1888. The municipal borough is under a mayor, 15 aldermen and 45 councillors. Area, 13,067 acres.

At the time of the Conquest Halifax formed part of the extensive manor of Wakefield, which belonged to the king, but in the 13th century was in the hands of John, earl Warrenne (c. 1245-1305). The prosperity of the town began with the introduction of the cloth trade in the 13th century, when there are said to have been only thirteen houses, which before the end of the 12th century had increased to 500. Camden, about the end of the 17th century, wrote that "the people are very industrious, so that though the soil about it be barren and improitable, not fit to live on, they have so flourished . . . by the clothing trade that they are very rich and have gained a reputation for it above their neighbours." The trade is said to have been increased by the arrival of certain merchants driven from the Netherlands by the persecution of the duke of Alva. Among the curious customs of Halifax was the Gibbet Law, which was probably established by a prescriptive right to protect the wool trade, and gave the inhabitants the power of executing any one taken within their liberty, who, when tried by a jury of sixteen of the freth-burgesses, was found guilty of the theft of any goods of the value of more than 13d. The executions took place on market days on a hill outside the town, the gibbet somewhat resembling a guillotine. The first execution recorded under this law took place in 1541, and the right was exercised in Halifax longer than in any other town, the last execution taking place in 1650. In 1635 the king granted the inhabitants of Halifax licence to found a workhouse in a large house given to them for that purpose by Nathaniel Waterhouse, and incorporated them under the name of the master and governors. Nathaniel Waterhouse was appointed the first master, his successors being elected every year by the twelve governors from among themselves. Halifax was a borough by prescription, its privileges growing up with the increased prosperity brought by the cloth trade, but it was not incorporated until 1848. Since the Reform Act of 1832 the burgesses have returned two members to parliament.

In 1607 David Waterhouse, lord of the manor of Halifax, obtained a grant of two markets there every week on Friday and Saturday, and gave the inhabitants the power of executing any one found guilty of the theft of goods of the value of more than 13d. The executions took place on market days on a hill outside the town, the gibbet somewhat resembling a guillotine. The first execution recorded under this law took place in 1541, and the right was exercised in Halifax longer than in any other town, the last execution taking place in 1650. In 1635 the king granted the inhabitants of Halifax licence to found a workhouse in a large house given to them for that purpose by Nathaniel Waterhouse, and incorporated them under the name of the master and governors. Nathaniel Waterhouse was appointed the first master, his successors being elected every year by the twelve governors from among themselves. Halifax was a borough by prescription, its privileges growing up with the increased prosperity brought by the cloth trade, but it was not incorporated until 1848. Since the Reform Act of 1832 the burgesses have returned two members to parliament.

During the Civil War Halifax was garrisoned by parliament, and a field near it is still called the Bloody Field on account of an engagement which took place there between the forces of parliament and the Royalists.

Haliṣāh (Hebrew, הָלִישָׁה "untiring"), the ceremony by which a Jewish widow releases her brother-in-law from the obligation to marry her in accordance with Deuteronomy xxv. 5-6, and obtains her own freedom to marry. By the law of Moses it became obligatory upon the brother of a man dying childless to take his widow as wife. If he refused, "then shall his brother's wife come unto him in the presence of the elders and loose his shoe from off his foot, and spit in his face, and shall answer and say, So shall it be done unto that man that will not build up his brother's house." By Rabbinical law the ceremony was later made more complex. The parties appear before a court of three elders with two assessors. The place is usually the synagogue house, or that of the Rabbi, sometimes that of the widow. After inquiry as to the relationship of the parties and their status (for if either be a minor or deformed, haliṣāh cannot take place), the ceremony is performed. It usually takes place in the presence of witnesses, who are usually the property of the community and make entirely of leather from the skin of a "clean" animal. It is of two pieces, the upper part and the sole, sewn together with leathern threads. It has three small straps in front, and two white straps to bind it on the leg. After it is strung on, the man must walk four cubits in the presence of the court. The widow then loosens and removes the shoe, throwing it some distance, and spits on the ground, repeating thrice the biblical formula "So shall it be done," &c. Haliṣāh, which is still common among orthodox Jews, is also called the "Scotch Brigade" or, according to some, the "Scotch UNITAT" which his father had been largely instrumental in raising, Hugh Halkett served in India from 1788 to 1801. In 1803 his elder brother Colin was appointed to command a battalion of the newly formed King's German Legion, and in this he became senior captain and then major. Under his brother's command he served with Cathcart's expedition to Hanover, Rügen and Copenhagen, where his bold initiative on outposts duty won commendation. He was in the Peninsula in 1808-1809, and at Walcheren. At Albuera, Salamanca, &c., he commanded the 2nd Light Infantry Battalion, C.G.L., in succession to his brother, and at Venta del Pozo in the Burgos retreat he greatly distinguished himself. In 1813 he left the Peninsula and was subsequently employed in the organization of the new Hanoverian army. He led a brigade of these troops in Count Wallmoden's army, and bore a marked part in the battle of Göhrde and the action of Schestedt, where he took with his own hand a Danish standard. In the Waterloo campaign he commanded two brigades of Hanoverian militia which were sent to the front with the regulars, and during the fight with the Old Guard, which, after the capture of General Goffart, fell to Napoleon he elected to stay in the Hanoverian service, though he retained his half-pay lieutenant-colonelcy in the English army. He rose to be general and inspector-general of infantry. In his old age he led the Xth Federal Army Corps in the Danish War of 1845, and defeated the Danes at Oversee. He had the G.C.H., the C.B. and many foreign orders, including the Prussian order of the Black Eagle and pour le Mérite and the Russian St Anne.

See Knesebek, Leben des Freiherrn Hugh von Halkett (Stuttgart, 1862).

His brother, Sir Colin Halkett (1774-1836), British soldier, began his military career in the Dutch Guards and served in various "companies" for three years, leaving as a captain in 1795. From 1800 to the peace of Amiens he served with the Dutch troops in English pay in Guernsey. In August 1803 Halkett was one of the first officers assigned to the service of raising the King's German Legion, and he became major, and later lieutenant-colonel, commanding the 2nd Light Infantry Battalion. His battalion was employed in the various expeditions mentioned above, from Hanover to Walcheren, and in 1811 Colonel Halkett succeeded Charles Alten in the command of the Light Brigade, K.G.L., which he held throughout the Peninsula War from Albuera to Toulouse. In 1815 Major-General Sir Colin Halkett commanded the 4th British Brigade of Alten's division, and at Waterloo he received four wounds. Unlike his brother, he remained in the British service, in which he rose to general. At the time of his death he was governor of Chelsea.
HALL, BASIL (1788-1844), British naval officer, traveller and miscellaneous writer, was born at Edinburgh on the 31st of December 1788. His father was Sir James Hall of Dunglass, the geologist. Basil Hall was educated at the High School, Edinburgh, and in 1802 entered the navy, where he rose to the rank of post-captain in 1817, after seeing active service in several fields. By observing the ethnological as well as the physical peculiarities of the countries he visited, he collected the materials for a very large number of scientific papers. In 1816 he commanded the sloop "Lyra," which accompanied Lord Amherst's embassy to China; and he described his cruise in *An Account of a Voyage of Discovery to the West Coast of Corea and the Great Loo-choo Island in the Japan Sea* (London, 1818). In 1820 he hold a command on the Pacific coast of America, and in 1824 published two volumes of *Extracts from a Journal written on the Coasts of Chili, Peru and Mexico in the Years 1820-22*. Retiring on half-pay in 1824, Hall in 1825 married Margaret, daughter of Sir John Hunter, and in her company travelled (1827-1828) through the United States. In 1829 he published his *Travels in North America in the Years 1827 and 1828*, which was assailed by the American press for its views of American society. *Schloss Heinfelden, or, Woodland Travels in Lower Swabia* (1836), is partly a romance, partly a description of a visit paid by the author to the castle of the countess Purgstall. *Spain and the Seat of War in Spain* appeared in 1837. The *Fragments of Voyages and Travels* (6 vols.) were issued in three detachments between 1831 and 1840. Captain Hall was a fellow of the Royal Societies of London and Edinburgh, and of the Royal Astronomical, Royal Geographical and Geological Societies. His last work, a collection of sketches and tales under the name of *Patchwerk* (1841), had not been long published before its author became insane, and he died in Haslar hospital, Ports- mouth, on the 11th of September 1844.

HALL, CARL CHRISTIAN (1812-1858), Danish statesman, son of the highly respected artisan and train-teacher colonel Mada Hall, was born at Christianshavn on the 25th of February 1812. After a distinguished career at school and college, he adopted the law as his profession, and in 1837 married the highly gifted but eccentric Augusta Marie, daughter of the philologist Peter Olof Bröndsted. A natural conservatism indisposed Hall at first to take any part in the popular movement of 1848, to which almost all his friends had already adhered; but the moment he was convinced of the inevitability of popular government, he resolutely and sympathetically followed in the new paths. Sent to the Rigsdagsamling of 1848 as member for the first district of Copenhagen, a constituency he continued to represent in the Folketing till 1881, he immediately took his place in the front rank of Danish politicians. From the first he displayed rare ability as a debater, his inspiring and yet amiable personality attracted hosts of admirers, while his extraordinary tact and temper disarmed opposition and enabled him to mediate between extremes without ever sacrificing principles.

Hall was not altogether satisfied with the fundamental law of June; but he considered it expedient to make the best use possible of the existing constitution and to unite the best conservative elements of the nation in its defence. The aloofness and sulkiness of the aristocrats and landed proprietors he deeply deplored. Failing to rally them to the good cause he determined anyhow to organize the great cultivated middle class into a political party. Hence the "June Union," whose programme was progress and reform in the spirit of the constitution, and at the same time opposition to the one-sided democratism and party-tyranny of the Bondenemor or peasant party. The "Union" exercised an essential influence on the elections of 1852, and was, in fact, the beginning of the national Liberal party, which found its natural leader in Hall. During the years 1852-1854 the burning question of the day was the connexion between the various parts of the monarchy. Hall was "eider-dansk" by conviction. He saw in the closest possible union between the kingdom and a Schleswig freed from all risk of German interference the essential condition for Denmark's independence; but he did not think that Denmark was strong enough to carry such a policy through unsupported, and he was therefore inclined to promote it by diplomatic means and international combinations, and strongly opposed to the Conventions of 1851-1852 (See Denmark: History), though he was among the first, subsequently, to accept them as an established fact and the future basis for Denmark's policy.

Hall first took office in the Bang administration (12th of December 1854) as minister of public worship. In May 1857 he became president of the council after Andræ, Bang's successor, had retired, and in July 1858 he exchanged the ministry of public worship for the ministry of foreign affairs, while still retaining the premiership.

Hall's programme, "den Konstitutionelle Helstaf," i.e. a single state with a common constitution, was difficult enough in a monarchy which included two nationalities, one of which, to a great extent, belonged to a foreign and hostile jurisdiction. But as this political monstrosity had already been guaranteed by the Conventions of 1851-1852, Hall could not rid himself of it, and the attempt to establish this "Helstaf" was made accordingly by the Constitution of the 23rd of November 1863. The failure of the attempt and its disastrous consequences for Denmark's ideas on the last half of the 19th century, was decided not by Hall himself soon became aware of the impossibility of the "Helstaf," and his whole policy aimed at making its absurdity patent to Europe, and substituting for it a constitutional Danish to the Elder which would be in a position to come to terms with an independent Holstein. That this was the best thing possible for Denmark is absolutely indisputable, and "the diplomatic Seven Years' War," which Hall in the meantime conducted with all the powers interested in the question is the most striking proof of his superior statesmanship. Hall knew that he was lost for the last great honour which was left (the 3rd of November 1879), he was appointed general's adjutant, and to the last he continued to hold the pen but by the sword. But he relied, ultimately, on the protection of the powers which had guaranteed the integrity of Denmark by the treaty of London, and if words have any meaning at all he had the right to expect at the very least the armed support of Great Britain.1 But the great German powers and the force of circumstances proved too strong for him. On the accession of the new king, Christian IX., Hall resigned rather than repeal the November Constitution, which gave Denmark something to negotiate upon in case of need. But he made matters as easy as he could for his successors in the Monrad administration, and the great Holsteinian catastrophe need not have been as serious as it was had his advice, frankly given, been intelligently followed after 1864 Hall bore more than his fair share of the odium and condemnation which weighed so heavily upon the national Liberal party, making no attempt to repudiate responsibility and refraining altogether from attacking patently unscrupulous opponents. But his personal popularity suffered not the slightest diminution, while his clear, almost intuitive, outlook and his unconquerable faith in the future of his country made him, during these difficult years, a factor of inestimable importance in the public life of Denmark. In 1879 he joined the Holstein-Holsteinborg ministry as minister of public worship, and in that capacity passed many useful educational reforms, but on the fall of the administration, in 1873, he retired altogether from public life. In the summer of 1879 Hall was struck down by apoplexy, and for the remaining nine years of his life he was practically bedridden. He died on the 14th of August 1888. In politics Hall was a practical, sagacious "opportunist," in the best sense of that much abused word, with an eye rather for things than for persons. Moreover, he had no very pronounced political ambition, and was an utter stranger to that longing for power, which drives so many men of talent to adopt extreme expedients. His urbanity and perfect

1 On this see the 3rd marquis of Salisbury's Political Essays, reprinted from the Quarterly Review.
equilibrium at the very outset incited sympathy, while his wit and humour made him the centre of every circle within which he moved. See Wilhelm Christian Sigurd Topsoe, Poliz. Portraitsstudier (Copenhagen, 1878); Schöller Parculus Vilhelm Birkedal, Personlige Opfølger (Copenhagen, 1890-1891).

HALL, CHARLES FRANCIS (1831-1871), American Arctic explorer, was born at Rochester, New Hampshire. After following the trade of blacksmith he became a journalist in Cincinnati; but his enthusiasm for Arctic exploration led him in 1859 to volunteer to the American Geographical Society to "go in search for the bones of Franklin." With the proceeds of a public subscription he was equipped for his expedition and sailed in May, 1860, for the Arctic Ocean, which he was never again to leave. Hall took up his abode in the regions to the north of Hudson Bay, where he found relics of Frobisher’s 16th-century voyages, and living with the Eskimo for two years he acquired a considerable knowledge of their habits and language. He published an account of these experiences under the title of Arctic Researches, and Life among the Esquimaux (1864). Determined, however, to learn more about the fate of the Franklin expedition he returned to the same regions in 1864, and passing five years among the Eskimo was successful in obtaining a number of Franklin relics, as well as information pointing to the exact fate of 76 of the crew, whilst also performing some geographical work of interest. In 1871 he was given command of the North Polar expedition fitted out by the United States Government in the "Polaris." Making a remarkably rapid passage up Smith Sound at the head of Baffin Bay, which was found to be ice-free, the "Polaris" reached on the 30th of August the lat. of 82° 11', at that time, and until the English expedition of 1876 the highest northern latitude attained by vessel. The expedition went into winter quarters in a sheltered cove on the Greenland coast. On the 24th of October, Hall on his return from a successful sledging expedition to the north was suddenly seized by an illness of which he died on the 8th of November. Capt. S. O. Buddington (1823-1888) assumed command, and although the "Polaris" was subsequently lost after breaking out of the ice, with only part of the crew aboard, the whole were ultimately rescued, and the scientific results of the expedition proved to be of considerable importance.

HALL, CHRISTOPHER NEWMAN (1816-1902), English Nonconformist divine, was born at Maidstone on the 22nd of May. Hall was appointed in 1832 by the London Missionary Society to be the printer of the Maidstone Journal, and the author of a popular evangelical work called The Sinner’s Friend. Christopher was educated at University College, London, and took the London B.A. degree. His theological training was gained at Highbury College, whence he was called in 1842 to his first pastorate at the Albion Congregational Church, Hull. During the twelve years of his ministry there the membership was greatly increased, and a branch chapel and school were opened. At Hull Newman Hall first began his active work in temperance reform, and in defence of his position wrote The Scriptural Claims of Total Abstinence. In 1854 he accepted a call to Surrey chapel, London, founded in 1783 by the Rev. Rowland Hill. A considerable sum had been bequeathed by Hill for the perpetuation of his work on the expiration of the lease; but, owing to some legal flaw in the will, the money was not available, and Newman Hall undertook to raise the necessary funds for a new church. By weekly offertories and donations the money for the beautiful building called Christ Church at the junction of the Kennington and Westminster Bridge Roads was collected, and within four years of opening (1850) the total cost (£63,000) was cleared. In 1862 Newman Hall resigned his charge and devoted himself to general evangelical work. Most of his writings are small booklets or tracts of a distinctly evangelical character. The best known of these is Come to Jesus, of which over four million copies have been circulated in forty different languages. Newman Hall visited the United States during the Civil War, and did much to promote a friendly understanding between England and America. A Liberal in politics, and a keen admirer of John Bright, few preachers of any denomination have exercised so far-reaching an influence as the "Dissenters’ Bishop," as he came to be termed. He died on the 18th of February 1902.

HALL, EDWARD (c. 1498-1547), English chronicler and lawyer, was born about the end of the 15th century, being a son of John Hall of Northall, Shropshire. Educated at Eton and King’s College, Cambridge, he became a barrister and afterwards filled the offices of common sergeant of the city of London and judge of the sheriff’s court. He was also member of parliament for Bridgnorth. Hall’s great work, The Union of the Noble and Illustre Families of Lancaster and York, commonly called Hall’s Chronicle, was first published in 1536, but a second English edition was issued by Richard Grafton in 1548, the year after Hall’s death, and another in 1550; these include a continuation from 1532 compiled by Grafton from the author’s notes. In 1899 an edition was published under the supervision of Sir Henry Ellis, and in 1904 the part dealing with the reign of Henry VIII. was edited by C. Whibley. The Chronicle begins with the accession of Henry IV. to the English throne in 1399; it follows the strife between the houses of Lancaster and York, and with Grafton’s continuation carries the story down to the death of Edward V. Hall’s name is famous in connection with the policy of his king in a very favourable light and shows his own sympathy with the Protestants. For all kinds of ceremonial he has all a lawyer’s respect, and his pages are often adorned and encumbered with the pageantry and material garniture of the story. The value of the Chronicle in its early stages is not great, but this increases when dealing with the reign of Henry VII. and is very considerable for the reign of Henry VIII. Moreover, the work is not only valuable, it is attractive. To the historian it furnishes what is evidently the testimony of an eye-witness on several matters of importance which are neglected by other narrators; and to the student of literature it has the exceptional interest of being one of the prime sources of Shakespeare’s historical plays.

See J. Gardiner, Early Chronicles of Europe; England (1879).

HALL, FITZEDWARD (1825-1901), American Orientalist, was born in Troy, New York, on the 21st of March 1825. He graduated with the degree of civil engineer from the Rensselaer Polytechnic Institute at Troy in 1842, and entered Harvard in the class of 1846; just before his class graduated he left college and went to India in search of a runaway brother. In January 1856 Hall was appointed professor of Arabic and English, in the government college at Benares; and in 1855 was made inspector of public instruction in Ajmere-Merwara and In 1856 in the Central Provinces. He settled in England in 1862 and received the appointment to the chair of Sanskrit, Hindustani and Indian jurisprudence in King’s College, London, and to the librarianship of the India Office. He died at Marlesford, Suffolk, on the 1st of February 1901. Hall was the first American to edit a Sanskrit text, Vishnupradana; his library of a thousand Oriental MSS. he gave to Harvard University.

His works include: in Sanskrit, Amsabadha (1842), Sthabhyanavacana (1856), Svarvasiddhata (1856), Vasantuddata (1859), Sankhyasara (1862) and Darsara (1865); in Hindi, Ballantynes’ Hindi Grammar (1868) and a Reader (1870); on English philology, Recent Publications of Professor Grant White, Modern English (1873). "On English Adjectives in -able, with Special Reference to Reliable" (Am. Jour. Philology, 1877), Doctor Inductus (1880).

HALL, ISAAC HOLLISTER (1837-1896), American Orientalist, was born in Norwalk, Connecticut, on the 12th of December 1837. He graduated at Hamilton College in 1859, was a tutor there in 1859-1865, graduated at the Columbia Law School in 1865, practised law in New York City until 1875, and in 1875-1877 taught in the Syrian Protestant College at Beirut, where he discovered a valuable Syriac manuscript of the Philoxenian version of a large part of the New Testament, which he published in part in facsimile in 1884. He worked with General Cerino in classifying the famous Cypriote collection in the Metropolitan Museum of New York City, and was a curator of that museum from 1885 until his death in Mount Vernon, New York, on the
HALL, SIR J.—HALL, JOSEPH

2nd of July 1896. He was an eminent authority on Oriental inscriptions. Following the scanty clues given by George Smith and Samuel Birch, and working on the data furnished by the di Czesnola collection, he succeeded about 1874 in deciphering an entire Cypriote inscription, and in establishing the Hellenic character of the dialect and the syllabic nature of the script.

HALL, SIR JAMES (1761-1832), Scottish geologist and physicist, eldest son of Sir John Hall, Bart., was born at Dun- glass on the 17th of January 1761; and became distinguished as the first to establish experimental research as an aid to geological investigation. He was intimately acquainted with James Hutton and John Playfair, and having studied rocks in various parts of Europe he was eventually led to accept and to demonstrate the truth of Hutton's views with regard to intrusive rocks. He commenced a series of experiments to illustrate the fusion of rocks, their vitreous and crystalline characters, and the influence of molten rocks in altering adjacent strata. He thus assisted in proving that granitic veins had been injected into overlying deposits after their consolidation. He studied the volcanic rocks in Italy and recognized that the old lava flows and the numerous dikes in Scotland must have had a similar origin. He made further experiments to illustrate the contortions of rocks. The results were brought before the Royal Society of Edinburgh. He died at Edinburgh on the 23rd of June 1832. He represented in parliament (1807-1812) the old borough of Michael in Cornwall; he also wrote an Essay on the Origin, History and Principles of Gothic Architecture (1813).

His eldest son, John Hall (1787-1860), who succeeded him, was a Fellow of the Royal Society; the second son, Captain Basil Hall (e. g.), was the distinguished traveller; the third son, James Hall (1800-1854), was a painter, art-patron, and a friend of Sir David Wilkie.

HALL, JAMES (1793-1868), American judge and man of letters, was born at Philadelphia on the 19th of August 1793. After some time prosecuting the study of law, he in 1812 joined the army, and in the war with Great Britain distinguished himself in engagements at Lundy's Lane, Niagara and Fort Erie. On the conclusion of the war he accompanied an expedition against Aiglers, but in 1818 he resigned his commission, and continued the study of law at Pittsburg. In 1820 he removed to Shawnee- town, Illinois, where he commenced practice at the bar and also edited the Illinois Gazette. Soon after he was appointed public prosecutor of the circuit, and in 1824 state circuit judge. In 1827 he became state treasurer, and held that office till 1831, but he continued at the same time his legal practice and also edited the Illinois Intelligencer. Subsequently he became editor of the Western Souvenir, an annual publication, and of the Illinois Monthly Magazine, afterwards the Western Monthly Magazine. He died near Cincinnati on the 15th of July 1868.

The following are his principal works:—Letters from the West, on the Civil and Graphic History of the United States; and the Portfolio, and collected and published in London in 1828; Legends of the West (1832); The Soldier's Bride and other Tales (1835); The Harper's Head, a Legend of Kentucky (1834); Sketches of the West (2 vols., 1835); Tales of the Border (1835); Notes on the Western States (1838); History of the Indian Tribes, in conjunction with T. L. McKeeley (3 vols., 1838-1844); The Wilderness and the War-path (1845); Romance of Western History (1857).

HALL, JAMES (1811-1898), American geologist and palaeontologist, was born at Hingham, Massachusetts, on the 12th of September 1811. After the death of his early life he became attached to the study of natural history, and he completed his education at the Poly-technic Institute at Troy in New York, where he graduated in 1832, and afterwards became professor of chemistry and natural science, and subsequently of geology. In 1836 he was appointed one of the geologists on the Geological Survey of the state of New York, and he was long before charged with the palaeontological work. Eventually he became state geologist and director of the museum of natural history at Albany. His published papers date from 1836, and include numerous reports on the geology and palaeontology of various portions of the United States and Canada. He dealt likewise with physical geology, and in 1859 discussed the connexion between the accumulation of sedimentary deposits and the elevation of mountain-chains. His chief work was the description of the invertebrate fossiliferous New York—in which he dealt with the graptolites, brachiopods, mollusca, trilobites, echinoda and crinoids of the Palaeozoic formations. The results were published in a series of quarto volumes entitled Palaeontology of New York (1847-1894), in which he was assisted in course of time by R. P. Whitfield and J. M. Clarke. He published also reports on the geology of Oregon and California (1843), Utah (1852), Iowa (1859) and Wisconsin (1862). He received the Wollaston medal from the Geological Society of London in 1858. He was a man of great energy and untiring industry, and in 1897, when in his eighty-sixth year, he journeyed to St Petersburg to take part in the International Geological Congress, and then joined the excursion to the Ural mountains. He died at Albany on the 7th of August 1898.

See Life and Work of James Hall, by H. C. Hovey, Amer. Geol. xxii., 1899, p. 137 (portraits).

HALL, JOSEPH (1754-1819), English bishop and satirist, was born at Bristow park, near Ashby de la Zouch, Leicestershire, on the 1st of July 1754. His father, John Hall, was agent in London for the iron trade, east of Huntingdon, and his mother, Winifred Bambridge, was a postilion's daughter, born at St Monica. Joseph Hall received his early education at the local school, and was sent (1789) to Emmanuel College, Cambridge. Hall was chosen for two years in succession to read the public lecture on rhetoric in the schools, and in 1795 became fellow of his college. During his residence at Cambridge he wrote his Virgilediurn (1797), satires written after Latin models. The claim he put forward in the prologue to the earliest English satirist:—

"I first adventure, follow me who list
And be the second English satirist"—
gave bitter offence to John Marston, who attacks him in the satires published in 1598. The archbishop of Canterbury gave an order (1599) that Hall's satires should be burnt with works of John Marston, Marlowe, Sir John Davies and others on the ground of licentiousness, but shortly afterwards Hall's book, certainly unjustly condemned, was ordered to be "stayed at the press," which may be interpreted as reprieved (see Notes and Queries, 3rd series, xii. 436). Having taken holy orders, Hall was appointed the master of Blundell's school, Tiverton, but he refused it in favour of the living of St Monica, where he was present (1691) by Sir Robert Drury. In his parish he had an opponent in a Mr Lilly, whom he describes as "a witty and bold atheist." In 1693 he married; and in 1695 he accompanied Sir Edmund Bacon to Spa, with the special aim, he says, of acquainting himself with the state and practice of the Romish Church. At Brussels he disputed at the Jesuit College on the authentic character of modern miracles, and his inquiring and argumentative disposition more than once threatened to produce serious results, so that his patron at length requested him to abstain from further discussion. His devotional writings had attracted the notice of Henry, prince of Wales, who made him one of his chaplains (1668). In 162 Lord Denny, afterwards earl of Norwich, gave him the curacy of Waltham-Holy-Cross, Essex, and in the same year he received the degree of D.D. Later he received the prebend of Willenhall in the collegiate church of Wolverhampton, and in 1616 he accompanied James Hay, Lord Doncaster, afterwards earl of Carlisle, to France, where he was sent to congratulate Louis XIII. On his return, but Hall was compelled by illness to return. In his absence the king nominated him dean of Worcester, and in 1617 he accompanied James to Scotland, where he defended the five points of ceremonial which the king desired to impose upon the Scots. In the next year he was one of the English
deputies at the synod of Dort. In 1634 he refused the see of Gloucester, but in 1627 became bishop of Exeter.

He took an active part in the Arminian and Calvinistic controversy in the English church. He wrote in his Via media, The Way of Errors, which divided the two parties to accept a compromise. In spite of his Calvinistic opinions he maintained that to acknowledge the errors which had arisen in the Catholic church did not necessarily imply disbelief in her catholicity, and that the Church of England having repudiated these errors should not deny the claims of the Roman Catholic Church on that account. This view commended itself to Charles I. and his episcopal advisers, but at the same time Archbishop Laud sent spies into Hall's diocese to report on the Calvinistic tendencies of the bishop and his clergy. Dr. Puritan sometimes withdrew from London, best by sea, however, he spent his three years spent in his palace, and at last he resigned his office. He then contributed five pamphlets, vigorously attacking Hall and his early satires.

In 1641 Hall was translated to the see of Norwich, and in the same year sat on the Lords' Committee on religion. On the 30th of December he was, with other bishops, brought before the bar of the House of Lords to answer a charge of high treason of which the Commons had voted them guilty. They were finally convicted of an offence against the Statute of Praemunire, and condemned to forfeit their estates, receiving a small maintenance from the parliament. They were immured in the houses of commons, but, on a fine of £600, contributed on finding hall for £300 each. On his release Hall proceeded to his new diocese at Norwich, the revenues of which he seems for a time to have received, but in 1643, when the property of the "malignants" was sequestered, Hall was mentioned by name. Mrs Hall had difficulty in securing a fifth of the maintenance (£400) assigned to the bishop by the parliament; they were eventually ejected from the palace, and the cathedral was dismantled. Hall retired to the village of Higham, near Norwich, where he spent the time preaching and writing until he was first forbidden by the parliament and at last disabled by God." He bore his many misfortunes and the additional burden of much bodily suffering with sweetness and patience, dying on the 8th of September 1656. Thomas Fuller says: "He was commonly called our English Seneca, for the pureness, plainness, and fulness of his style. Not unhappy at Controversies, more happy at Comments, very good in his Characters, better in his Sermons, best of all in his Meditations."

Bishop Hall's polemical writings, although vigorous and effective, were chiefly of ephemeral interest, but many of his devotional writings have been often reprinted. It is by his early work as the censor of morals and the unpalatable critic of contemporary literary extravagance and affectations that he is best known. Virgidiemnium. Six Books. First three Books. Of Toothless Satyrs. (1) Poetical, (2) Academical, (3) Moral. (1652) was followed by an amended edition in 1598, and in the same year by Virgidiemnium. The three last books. Of saying Satyres (reprinted 1599). His claim to be reckoned the earliest English satirist, even in the formal sense, cannot be justified. Thomas Lodge, in his Pig for Mamas (1592), had written four satires in the manner of Horace, and John Marston and John Donne both wrote satires about the same time, although the character of Hall's case is rather after that of Virgidiemnium. But if he was not the earliest, Hall was certainly one of the best. He writes in the heroic couplet, which he manages with great ease and smoothness. In the first book of his satires (Poetical) he attacks the writers whose verses were devoted to licentious subjects, the bombast of Tamburlaine and tragedies built on similar lines, the laments of the ghosts of the Mirror for Magistrates, the metrical eccentricities of Gervil Harvey and Grissell were a (1643). His Meditations, or Meditations on the three great events of the day. The first was the Restoration, 1660; the second the Death of Charles II. 1685; and the last the Reformation of the Church of England. These Meditations appeared in 1690. They were reprinted 1691, and 1696. He also published the Book Iustrata of 1608, and 1609), by "Mercurius Britannicus," translated into English by John Healy (1608) as The Discovery of the World of Antiquities and the English Mercury. Mundus alter is an excuse for a satirical description of London, with some criticism of the Romish church, its manners and customs, and is said to have furnished Swift with ideas for Gulliver's Travels. It was not ascribed to him by name until 1674, when Thomas Hyde, the librarian of the Bodleian, identified "Mercurius Britannicus" with John Hall. For the question of the authorship of this pamphlet, and the arguments that may be advanced in favour of the suggestion that it was written by Alberico Gentili, see E. A. Petherick, Mundus alter et idem, reprinted from the Gentleman's Magazine (July 1896). His controversial writings, not already mentioned, include: A Common Apology ... against the Brownists (1610), in answer to John Robinson's Sersonic Epistle; The Old Religion; A treatise, wherein is laid open what has been asserted falsely in Smectymnuus," brought under the patronage of the Romane Church; and the blame of this schisme is cast upon the true Authors ... (1628); Calubia Noae olivam adherens ... a sermon preached at St Paul's in 1623; Episcopacy by Divine Right (1640); a Broadside to the disbelievers of Smectymnuus; A Modest Confutation of ... (Millon's) Animadversiones (1642).

His devotional works include: Holy Observations, &c. I. Some few of David's Psalms Metaphorised (1607 and 1609); three centuries of Meditations and Verses, and Morall (1607, 1609, 1610), edited by Charles Sayle (1901); The Arte of Divine Meditation (1607); Heaven upon Earth, or of True Peace and Tranquility of Mind (1606), reprinted with some of his letters in John Weley's Christian Library, vol. iv. (1810); Occasional Meditations ... (1630), edited by his son Robert Hall; Henochism; or, a Treatise showing how to walk with God (1639), translated from Bishop Hall's Latin by Moses Wall; and The Christian's Defence of his Sect and Religion.printed by T. Bedel ... (1646, 1752); Christ Mystically; or the blessed union of Christ and his Members (1647), of which George Gordon was a student (reprinted from Gordon's copy, 1893); Susserium cum Deo (1658); The Great Mystery of Godliness (1658); Resolutions and Decisions of Divers Practical cases of Conscience (1649, 1656, 1654).

Hall was the chief authority for Hall's biography is to be found in his autobiographical tracts: Observations of some Specialties of Divine Providence in the Life of Joseph Hall, Bishop of Norwich, Written with his own hand, and his True Description, a reprint of which was consulted by Mr. Hall's heirs in writing the Bishop Hall's Life. In 1615 Hall published A Collection of such treatises as have been ... published ... (1615, 1617, 1621): in 1625 appeared his Works (reprinted 1627, 1628, 1634, 1662). The first complete Works appeared in 1688, edited by Dr. Warton (1697), and revised by Peter Hall (1857) and by Philip Wynter (1863). See also Bishop Hall, his Life and Times (1826), by Rev. John Jones; Life of Joseph Hall, by Rev. George Lewis (1866); A. B. Grosart. The Complete Poems of Joseph Hall... with introductions, &c. (1879); Saines, &c. (Early English Poets, ed. S. W. Singer, 1824). Many of Hall's works were translated into French, and some into Dutch, and there have been numerous English Editions.

HALL, MARSHALL (1790-1857). English physician, was born on the 18th of February 1790, at Basford, near Nottingham, where his father, Robert Hall, was a cotton manufacturer. Having attended the Rev. J. Blanchard's academy at Nottingham, he entered a chemist's shop at Newark, and in 1809 began to study medicine at Edinburgh University. In 1811 he was elected senior president of the Royal Medical Society; the following year he took the M.D. degree, and was immediately appointed resident house physician to the Royal Infirmary, Edinburgh. This appointment he resigned after two years, when he visited Paris and its medical schools, and, on his return, wrote The Tomb of Sir John Beauchamp (1835). In old St. Paul's with the key known, in error, as that of Duke Humphrey of Gloucester. "To dine with Duke Humphrey" was to go hungry among the debtors and beggars who frequented "Duke Humphrey's Walk" in the cathedral.
tour, those also of Berlin and Göttingen. In 1817, when he settled at Nottingham, he published his *Diagnosis*, and in 1818 he wrote the *Mimases*, a work on the affections denominated bilious, nervous, &c. The next year he was elected a fellow of the Royal Society of Edinburgh, and in 1825 he became physician to the Nottingham general hospital. In 1826 he removed to London, and in the following year he published his *Commentaries* on the more important diseases of females. In 1830 he issued his *Observations on Blood-letting, founded on researches on the morbidly curative effects of loss of blood*, which were acknowledged by the medical profession to be of vast practical value, and in 1831 his *Experimental Essay on the Circulation of the Blood in the Capillary Vessels*, in which he showed that the blood-channels intermediate between arteries and veins serve the office of bringing the fluid blood into contact with the material tissues of the system. In the following year he read before the Royal Society a paper "On the inverse ratio which subsists between Respiration and Irritability in the Animal Kingdom." His most important work in physiology was concerned with the theory of reflex action, embodied in a paper "On the reflex Function of the Medulla Oblongata and the Medulla Spinalis" (1832), which was supplemented in 1837 by another "On the True Spinal Marrow, and the Excito-motor System of Nerves." The "reflex function" excited great attention on the continent of Europe, though in England some of his papers were refused publication by the Royal Society. Hall thus became the authority on the multiform deranged states of health referable to an abnormal condition of the nervous system, and he gained a large practice. His "ready method" for resuscitation in drowning and other forms of suspended respiration has been the means of saving innumerable lives. He died at Brighton of a throat affection, aggravated by lecturing, on the 11th of August 1857.

A list of his works and details of his "ready method," &c., are given in his *Memoirs* by his widow (London, 1861).

HALL, ROBERT (1764–1831), English Baptist divine, was born on the 2nd of May 1764, at Arnside near Leicester, where his father, Robert Hall (1726–1791), a man whose cast of mind in some respects resembled closely that of the son, was pastor of a Baptist congregation. Robert was the youngest of a family of fourteen. While still at the dame's school his passion for books absorbed the greater part of his time, and in the summer it was his custom after school hours to retire to the churchyard with a volume, which he continued to peruse there till nightfall, making out the meaning of the more difficult words with the help of a pocket dictionary. From his sixth to his eleventh year he attended the school of Mr Simmons at Wigston, a village four miles from Arnside. There his precocity assumed the exceptional form of an intense interest in metaphysics, partly provoked and further fostered by the reading of metaphysical treatises which he procured from the library; and before he was nine years of age he had read and re-read Jonathan Edwards's *Treatise on the Will* and Butler's *Analogy*. This incessant study at such an early period of life seems, however, to have had an injurious influence on his health. After he left Mr Simmons's school his appearance was so sickly as to awaken fears of the presence of phthisis. In order, therefore, to obtain the benefit of a change of air, he stayed for some time in the house of a gentleman near Kettering, who with an impartiality which Hall himself afterwards referred to as "egregious," prevailed upon the boy of eleven to give occasional addresses at prayer meetings. As his health seemed rapidly to recover, he was sent to a school at Northampton conducted by the Rev. John Ryland, where he remained a year and a half, and "made great progress in Latin and Greek." On leaving school he for some time studied divinity under the direction of his father, and in October 1788 he entered the Bristol academy for the preparation of students for the Baptist ministry. Here the self-possession which had enabled him in his twelfth year to address unalteringly various audiences of grown-up people seems to have strangely forsaken him; for when, in accordance with the arrangements of the academy, his turn came to deliver an address in the vestry of Broadmead chapel, he broke down on two separate occasions and was unable to finish his discourse. On the 13th of August 1790 he was set apart to the ministry, but he still continued his studies at the academy; and in 1791, in accordance with the provisions of an exhibition which he held, he entered King's College, Aberdeen, where he took the degree of master of arts in March 1795. At the university he was without a rival of his own standing in any of the classes, distinguishing himself alike in classics, philosophy and mathematics. He there formed the acquaintance of Mackintosh (afterwards Sir James), who, through a year his junior in age, was a year his senior as a student. While they remained at Aberdeen the two were inseparable, reading together the best Greek authors, especially Plato, and discussing, either during their walks by the sea-shore and the banks of the Don or in their rooms until early morning, the most perplexed questions in philosophy and religion.

During the vacation between his last two sessions at Aberdeen, Hall acted as assistant pastor to Dr Evans at Broadmead chapel, Bristol, and three months after leaving the university he was appointed classical tutor in the Bristol academy, an office which he held for more than five years. Even at this period his extraordinary eloquence had excited an interest beyond the bounds of the denomination to which he belonged, and when he preached the chapel was generally crowded to excess, the audience including many persons of intellectual tastes. Suspicions in regard to his orthodoxy having in 1798 led to a misunderstanding with his colleague and a part of the congregation, he in July 1799 accepted an invitation to make trial of a congregation at Cambridge, of which he became pastor in July of the following year. From a statement of his opinions contained in a letter to the congregation which he left, it would appear that, while a firm believer in the proper divinity of Christ, he had at this time disowned the cardinal principles of Calvinism—the federal headship of Adam, and the doctrine of absolute election and reprobation; and that he was so far a materialist as to "hold that man's thinking powers and faculties are the result of a certain organization of matter, and that after death he ceases to be conscious till the resurrection." It was during his Cambridge ministry, which extended over a period of fifteen years, that his oratory was most brilliant and most immediately powerful. At Cambridge the intellectual character of a large part of the audience supplied a stimulus which was wanting at Leicester and Bristol.

His first published compositions had a political origin. In 1791 appeared *Christianity consistent with the Love of Freedom*, in which he defended the political conduct of dissenters against the attacks of the Rev. John Clayton, minister of Weighhouse, and gave eloquent expression to his hopes of great political and social ameliorations as destined to result nearly or remotely from a subversion of old ideas and institutions in the maelstrom of the French Revolution. In 1793 he expounded his political sentiments in a powerful and more extended pamphlet entitled an *Apology for the Freedom of the Press*. On account, however, of certain asperities into which the warmth of his feelings had betrayed him, and his conviction that he had treated his subject in too superficial a manner, he refused to permit the publication of the pamphlet beyond the third edition, until the references of political opponents and the circulation of copies without his sanction induced him in 1821 to prepare a new edition; from which he omitted the attack on Bishop Horsley, and to which he prefixed an advertisement stating that his political opinions had undergone no substantial change. His other publications while at Cambridge were three sermons—*On Modern Infidelity* (1801), *Reflections on War* (1802), and *Sentiments proper to the present Crisis* (1803). He began, however, to suffer from mental derangement in November 1804. He recovered so speedily that he was able to resume his duties in April 1805, but a recurrence of the malady rendered it advisable for him on his second recovery to resign his pastoral office in March 1806.

On leaving Cambridge he paid a visit to his relatives in Leicestershire, and then for some time resided at Enderby, preaching occasionally in some of the neighbouring villages.
Latterly he ministered to a small congregation in Harvey Lane, Leicester, from whom at the close of 1806 he accepted a call to be their stated pastor. In the autumn of 1807 he changed his residence from Enderby to Leicester, and in 1808 he married the servant of a brother minister. His proposal of marriage had been made after almost an momentous acquaintance, and, according to the traditionary account, in very abrupt and peculiar terms; but judging from his subsequent domestic life, his choice did sufficient credit to his penetration and sagacity. His writings at Leicester embraced various tracts printed for private circulation; a number of contributions to the Eclectic Review, among which may be mentioned his articles on "Foster's Essays" and on "Zeal without Innovation"; several sermons, including those On the Advantages of Knowledge to the Lower Classes (1810), On the Death of the Princess Charlotte (1817), and On the Death of Dr Ryland (1825); and his pamphlet on Terms of Communion, in which he advocated intercommunication with all those who acknowledged the "essentials" of Christianity. In 1819 he published an edition in one volume of his sermons formerly printed. On the death of Dr Ryland, Hall was invited to return to the pastorate of Broadmead chapel, Bristol, and as the peace of the congregation at Leicester had been to some degree disturbed by a controversy regarding several cases of discipline, he resolved to accept the invitation, and removed there in April 1826. The malady of renal calculi had for many years rendered his life an almost continual martyrdom, and henceforth increasing infirmities and suffering affected him. Gradually the inability to take proper exercise, by inducing a plethora habit of body and impeding the circulation, led to a diseased condition of the heart, which resulted in his death on the 21st of February 1831. He is remembered as a great pulpit orator, of a somewhat laboured, rhetorical style in his written works, but of undeniable vigour in his spoken sermons.

HALL, SAMUEL CARTER (1800-1886), English journalist, was born at Waterford on the 9th of May 1800, the son of an army officer. In 1821 he went to London, and in 1823 became a parliamentary reporter. From 1826 to 1837 he was editor of a great number and variety of public prints, and in 1839 he founded and edited The Art Journal. His early position in bugus "Old Masters" earned for this publication a considerable reputation. Hall resigned the editorship in 1856, and was granted a Civil List pension "for his long and valuable services to literature and art." He died in London on the 16th of March 1889. His wife, Anna Maria Fielding (1800-1881), became well known as Mrs S. C. Hall, for her numerous novels, sketches of Irish life, and plays. Two of the last, The Groves of Blarney and The French Refugee, were produced in London with success. She also wrote a number of children's books, and was practically interested in various London charities, several of which she helped to found.

HALL, WILLIAM EDWARD (1835-1894), English writer on international law, was the only child of William Hall, M.D., a descendant of a junior branch of the Halls of Dunglass, and of Charlotte, daughter of William Cotton, F.S.A. He was born on the 22nd of August 1835, at Leatherhead, Surrey, but passed his childhood abroad, Dr Hall having acted as physician to the king of Hanover, and subsequently to the British legation at Naples. Hence, perhaps, the son's taste in after life for art and modern languages. He was educated partly at the early age of seventeen, he matriculated at Oxford, where in 1856 he took his degree with a first class in the then recently instituted school of law and history, gaining, three years afterwards, the chancellor's prize for an essay upon "the effect upon Spain of the discovery of the precious metals in America." In 1869 he was called to the bar at Lincoln's Inn, but devoted his time less to any serious attempt to obtain practice than to the study of Italian art, and to travelling over a great part of Europe, always bringing home admirable water-colour drawings of buildings and scenery. He was an early and enthusiastic member of the Alpine Club, making several first ascents, notably that of the Lyskamm. He was always much interested in military matters, and was under fire, on the Danish side, in the war of 1864. In 1869 he published a pamphlet entitled "A Plan for the Reorganization of the Army," and, many years afterwards, he saw as much as he was permitted to see of the expedition sent for the rescue of Gordon. He would undoubtedly have made his mark in the army, but in later life his ideal, which he realized, with much success, first at Llanfihangel in Monmouthshire, and then at Coker Court in Somersetshire, was, as has been said, "the English country gentleman, with cosmopolitan experiences, encyclopaedic knowledge, and artistic feeling." His travels took him to Lapland, Egypt, South America and India. He had done good work for several government offices, in 1871; as inspector of returns under the Elementary Education Act, in 1877 by reports to the Board of Trade upon Oyster Fisheries, in France as well as in England; and all the time was amassing materials for ambitious undertakings upon the history of civilization, and of the colonies. His title to lasting remembrance rests, however, upon his labours in the realm of international law, recognized by his election as the "First Socié," in 1875, and as membre, in 1882, of the International Right of Neutrals. In 1894, he published a thin volume upon the Rights and Duties of Neutrals, and followed it up in 1880 by his magnum opus, the Treatise on International Law, unquestionably the best book upon the subject in the English language. It is well planned, free from the rhetorical vagueness which has been the besetting vice of older books of a similar character, full of information, and everywhere bearing traces of the sound judgment and statesmanlike views of its author. In 1894 Hall published a useful monograph upon a little-explored topic, the Foreign Jurisdictions of the British Crown," but he died in November of the same year, while apparently in the fullest enjoyment of bodily as well as mental vigour, he suddenly died. He married, in 1866, Imogen, daughter of Mr (afterwards Mr Justice) Grove, who died in 1886; and in 1891, Alice, daughter of Colonel Hill of Court Hill, Shropshire, but left no issue.

HALL, or Bad-Hall, a market-place and spa of Austria, in Upper Austria, 23 m. S. of Linz by rail. Pop. (1900) 984. It is renowned for its saline springs, strongly impregnated with iodine and bromine, which are considered very efficacious in scrofulous affections and veneral skin diseases. Although the springs are known since the 8th century, Hall attained its actual importance only since 1855, when the springs became the property of the government. The number of visitors in 1901 was 4,300.

HALL (generally known as Schwäbisch-Hall, to distinguish it from the small town of Hall in Tirol and Bad-Hall, a health resort in Upper Austria), a town of Germany, in the kingdom of Württemberg, situated in a deep valley on both sides of the Kocher, and on the railway from Heilbronn to Rährtes, 35 m. N.E. of Stuttgart. Pop. (1905) 9400. It possesses four Evangelical churches (of which the Michaeliskirche dates from the 13th century and has fine medieval carving), a Roman Catholic church, a handsome town hall and classical and modern schools. A short distance south from the town is the royal castle of Komburg, formerly a Benedictine abbey and now used as a garrison for invalid soldiers, with a church dating from the 12th century. The town is chiefly known for its product of salt, which is converted into brine and piped from Wilhelmsthal mine, 5 m. distant. Connected with the salt-works there is a salt-bath and whey-diet establishment. The industries of the town also include cotton-spinning, iron founding, tanning, and the manufacture of soap, starch, brushes, machines, carriages and metal ware.
Hall was early of importance on account of its salt-mines, which were held as a fief of the Empire by the so-called Salagairen (Salt-graves), of whom the earliest known, the counts of Westheim, had their seat in the castle of Hall. Later the town belonged to the Knights Templars. It was made a free imperial city in 1276 by Rudolph of Habsburg. In 1802 it came into the possession of Württemberg.

And (O.E. Halla, a northern Teutonic word, cf. Ger. Hallo), a term which has many significations in England and is applied sometimes to the manor house, the residence of the lord of the manor, which implied a territorial possession, but more often to the entrance hall of a mansion. In the latter case it was the burnt large room in the feudal castle up to the middle of the 13th century, when it served as audience chamber, dining-room, and dormitory. The hall was generally a parallelogram on plan, with a raised dais at the farther end, a large bow window on one side, and in one or two cases on both sides. At the entrance end was a passage, which was separated from the hall by a partition screen often elaborately decorated, and over which was provided a minstrels' gallery; on the opposite side of the passage were the hatches communicating with the servants. This arrangement is still found in some of the colleges at Oxford and Cambridge, such as those of New College, Christchurch, Wadham and Magdalen Oxford, and in Trinity College, Cambridge. In private mansions, however, the kitchen and offices have been removed to a distance and the great hall is only used for banquets. Among the more remarkable examples are the halls of Ayscoughfee Hall, Headfield; Brasted; Hardwick, Knole Stawaay in Gloucestershire; Wollaton, where it is situated in the centre of the mansion and lighted by clerestory windows; Burton Agnes in Yorkshire; Canons Ashley, Northamptonshire; Westwood Park, Worcestershire; Fountains, Yorkshire; Sydenham House, Devonshire; Cobham, Kent; Montacute, Somerset; Bolsover Castle, Derbyshire (vaulted and with two columns in the centre of the hall to carry the vault); Longford Castle, Wiltshire; Barborough, Derbyshire; Rushton Hall, Northamptonshire, with a bow window at each end of the dais and a third bow window at the other end; Knole, Kent; and at Mayfield, Sussex (with stone masts, but not carried to carry the roof), now converted into a Roman Catholic chapel. Many of these halls have hammer-beam roofs, the most remarkable of which is found in the Middle Temple Hall, London, where both the tie and collar beams have hammer-beams. Of other halls, Westminster is the largest, being 238 ft. long; followed by the Banqueting Hall, Whitehall, 170 ft; Wolsey's Hall, Hampton Court, 106 ft; the Egyptian Hall at the Mansion House; the hall at Lambeth, now the library; Crosby Hall; Gray's Inn Hall; the Guildhall; Charterhouse; and the following in the London City, Companies of the general: Companies of Brewers, Goldsmiths, Fishmongers. The hall term is also given to the following English mansions:—Haddon, Hardwick, Apethorpe, Aston, Blickling, Brereton, Burton Agnes, Cobham, Dingley, Rushton, Kirby, Lisford and Wollaton; and it was the name of some of the earlier colleges at Oxford and Cambridge, most of which have now been absorbed in other colleges, so that there remain only St Edmund's Hall, Oxford, and Trinity Hall, Cambridge.

Richard Henry (1777-1859), English historian, was the only son of John Hallam, canon of Windsor and dean of Bristol, and was born on the 9th of July 1777. He was educated at Eton and Christ Church, Oxford, where he graduated in 1799. Called to the bar, he practised for some years on the Oxford circuit; but his tastes were literary, and when, on the death of his father in 1812, he inherited a small estate in Lincolnshire, he gave himself up wholly to the studies of his life. He had early become connected with the brilliant band of authors and politicians who then led the Whig party, a connexion to which he owed his appointment to the well-paid and easy post of commissioner of stamps; but in practical politics, for which he was by nature unsuited, he took no active share. But he was an active supporter of many popular movements—particularly of that which ended in the abolition of the slave trade; and he throughout his entire life sincerely and profoundly attached to the political principles of the Whigs, both in their popular and in their aristocratic aspect.

Hallam's earliest literary work was undertaken in connexion with the great organ of the Whig party, the Edinburgh Review, where his review of Scott's Dryden attracted much notice. His first great work, The View of the State of Europe during the Middle Ages, was produced in 1815 and was followed sixteen years later by the Constitutional History of England. In 1838-1839 appeared the Introduction to the Literature of Europe in the 15th, 16th and 17th Centuries. These are the three works on which the fame of Hallam rests. They at once took a place in English literature which has never been seriously challenged. A volume of supplemental notes to his Middle Ages was published in 1848. These facts and dates represent nearly all the events of Hallam's career. The strongest personal interest in his life was the affection which belied him in the loss of his children, one after another. His eldest son, Arthur Henry Hallam,—the "A.H.H." of Tennyson's In Memoriam, and by the testimony of his contemporaries a man of the most brilliant promise,—died in 1833 at the age of twenty-two. Seventeen years later, his second son, Henry Fitzmaurice Hallam, was cut off like his brother at the very threshold of what might have been a great career. The premature death and high talents of these young men, and the association of one of them with the most popular poem of the age, have made Hallam's family afflictions better known than any other incidents of his life. He survived wife, daughter and sons by many years. In 1834 Hallam published The Remains in Prose and Verse of Arthuri Henry Hallam, with a Memoir of His Life. In 1852 a selection of Literary Essays and Characters from the Literature of Europe was published. Hallam was a fellow of the Royal Society, and a trustee of the British Museum, and enjoyed many other appropriate distinctions. In 1830 he received the gold medal for history, founded by George IV. He died on the 21st of January 1859.

The Middle Ages is described by Hallam himself as a series of historical dissertations, a comprehensive survey of the chief circumstances that can interest a philosophical inquirer during the period from the 5th to the 15th century. The work consists of nine long chapters, each of which is a complete treatise in itself. The history of France, of Italy, of Spain, of Germany, and of the Greek and Saracen empires, sketched in rapid and general terms, is the subject of five separate chapters. Others deal with the great institutional features of medieval society—the development of the feudal system, of the ecclesiastical system, and of the free political system of England. The last chapter sketches the general state of society, the growth of commerce, manners, and literature in the middle ages. The book may be regarded as a part of modern history, and the author prepared to the more detailed treatment of special lines of inquiry carried out in his subsequent works, although Hallam's original intention was to continue the work on the scale on which it had been begun.

The Constitutional History of England takes up the subject at the point at which it had been dropped in the View of the Middle Ages, viz. the accession of Henry VII., and carries it down to the accession of George III. Hallam stopped here for a characteristic reason, which it is impossible not to respect and to regret. He was unwilling to excite the prejudices of modern politics which seemed to him to run back through the whole period of the reign of George III. As a matter of fact they ran back much farther, as Hallam soon found. The sensitive impartiality which withheld him from touching perhaps the most interesting period in the history of the constitution did not save him from the charge of partisanship. The Quarterly Review for 1828 contains an article on the Constitutional History, written by Southey, full of raking and reproach. The work, he says, is the "production of a decided partisan," who "rakes in the ashes of long-forgotten and a thousand times buried slanders, 1

1 Lord Brougham, overlooking the constitutional chapter in the Middle Ages, censured Hallam for making an arbitrary beginning at this point, and proposed to write a more complete history himself.
for the means of heaping obloquy on all who supported the established institutions of the country." No accusation made by a critic ever fell so wide of the mark. Absolute justice is the standard which Hallam set himself and maintained. His view of constitutional history was that it should contain only so much of the general history of the time as bears directly on specific changes in the organization of the state, including therein judicial as well as ecclesiastical institutions. But while abstaining from irrelevant historical discussions, Hallam dealt with statesmen and policies with the calm and fearless impartiality of a judge. It was his cool treatment of such sanctified names as Charles, Cranmer and Laud that provoked the indignation of Southey and the Quarterly, who forgot that the same impartial measure was extended to statesmen on the other side. If his first work, however, be taken as a whole, we shall find that it was in the tacit assumption that the 19th-century theory of the constitution was the right theory in previous centuries, and that those who departed from it on one side or the other were in the wrong. He did unconsciously antedate the constitution, and it is clear from incidental allusions in his last work that he did not regard with favour the democratic changes which he thought to be impending. Hallam, like Macaulay, ultimately referred all political questions to the standard of Whig constitutionalism. But though his work is thus, like that of many historians, coloured by his convictions, it is not the outcome of a conscious purpose, and he was scrupulously conscientious in collecting and weighing his materials. In this he was helped by his legal training, and it was doubtless this fact which made the Constitutional History one of the text-books of English politics, to which men of all parties appealed, and which, in spite of all the work of later writers, still leaves it a standard authority.

Like the Constitutional History, the Introduction to the Literature of Europe contains general surveys of the branches of inquiry which had been opened up in the View of the Middle Ages. In the first chapter of the Literature, which is to a great extent supplementary to the last chapter of the Middle Ages, Hallam sketches the state of literature in Europe down to the end of the 14th century: the extinction of ancient learning which followed the fall of the Roman empire and the rise of Christianity; the preservation of the Latin language in the services of the church; and the slow revival of letters, which began to show itself soon after the 7th century—"the nadir of the human mind"—had been passed. For the first century and a half of his special period he is mainly occupied with a review of classical learning, this was not the outcome of a conscious purpose, and he adopts the plan of taking short decennial periods and noticing the most remarkable works which they produced. The rapid growth of literature in the 16th century compels him to resort to a classification of subjects. Thus in the period 1520-1550 we have separate chapters on ancient literature, theology, speculative philosophy and jurisprudence, the literature of taste, and scientific and miscellaneous literature; and the subdivisions of subjects is carried further of course in the later periods. Thus poetry, the drama and polite literature form the subjects of separate chapters. One inconvenient result of this arrangement is that the same author is scattered over many chapters, according as his works fall within this category or that period of time. Names like Shakespeare, Grotius, Bacon, Hobbes appear in half a dozen different places. The individuality of great authors is thus dissipated except when it has been preserved by an occasional sacrifice of the arrangement—and this defect, if it is to be esteemed a defect, is increased by the very sparing references to personal history and character with which Hallam was obliged to content himself. His plan to excluded biographical history, nor is the work, he tells us, to be regarded as a work of reference. It is rigidly an account of the books which would make a complete library of the period, arranged according to the date of their publication and the nature of their subjects. The history of institutions like universities and academies, and that of great popular movements like the Reformation, are of course

1 Technical subjects like painting or English law have been excluded by Hallam, and history and theology only partially treated.
representatives. On the 6th of June 1411 Pope John XXIII. made Hallam a cardinal, but there was some irregularity, and his title was not recognized. At the council of Constance (q.r.), which met in November 1414, Hallam was the chief English envoy. There he at once took a prominent position, as an advocate of the cause of Church reform, and of the superiority of the council to the pope. In the discussions which led up to the deposition of John XXIII. on the 20th of May 1415 he had a leading share. With the failure of John Hus and Jerome of Prague he had less concern. The emperor Sigismund, through whose influence the council had been assembled, was absent during the whole of 1416 on a diplomatic mission in France and England; but when he returned to Constance in January 1417, as the open ally of the English king, Hallam as Henry's trusted representative obtained increased importance. Hallam contrived skilfully to emphasize English prestige by delivering the address of welcome to Sigismund on his formal reception. Afterwards, under his master's direction, he gave the emperor vigorous support in the endeavour to secure a reform of the Church, before the council proceeded to the election of a new pope. This matter was still undecided when Hallam died suddenly, on the 4th of September 1417. After his death the direction of the English nation fell into less skilful hands, with the result that the cardinals were able to secure the immediate election of a new pope (Martin V., elected on the 11th of November). It has been supposed that the abandonment of the reformers by the English was due entirely to Hallam's death; but it is more likely that Henry V. allowed Alard and Franconville, with a chance successor, to have given Hallam discretionary powers which the bishop's successors used with too little judgment. Hallam himself, who had the confidence of Sigismund and was generally respected for his straightforward independence, might have achieved a better result.

Hallam was buried in the cathedral at Constance, where his tomb near the high altar is marked by a brass of English workmanship.

For the acts of the council of Constance see H. von der Hardt's Concilium Conscientie, and H. Finke's Acta concilii Conscientie. For a modern account see Mandell Creighton's History of the Papacy (6 vols., London, 1897).

HALLE, SIR CHARLES (originally KARL HALLE) (1819-1895), English pianist and conductor, German by nationality, was born at Hagen, in Westphalia, on the 11th of April 1819. He studied under Rink at Darmstadt in 1835, and as early as 1836 went to Paris, where for twelve years he lived in constant intercourse with Cherubini, Chopin, Liszt and other musicians, and enjoyed the friendship of such great literary figures as Albrecht de Musset and George Sand. He had started a set of chamber concerts with Alard and Franconville with a success, and had completed one series of them when the revolution of 1848 drove him from Paris, and he settled, with his wife and two children, in London. His pianoforte recitals, given at first from 1850 in his own house, and from 1860 in St James's Hall, were an important feature of London musical life, and it was due in great measure to them that a knowledge of Beethoven's pianoforte sonatas became general in English society. At the Musical Union founded by John Ellia, and at the Popular Concerts from their beginning, as a frequent performer, and from 1853 was a member of the Gentlemen's Concerts in Manchester, and in 1857, he started a series of concerts of his own, raising the orchestra to a pitch of perfection quite unknown at that time in England. In 1888 he married Madame Norman Neruda (b. 1839), the violinist, widow of Ludwig Norman, and daughter of Josef Neruda, members of whose family had long been famous for musical talent. In the same year he was knighted; and in 1890 and 1891 he toured with his wife in Australia and elsewhere. He died at Manchester on the 25th of October 1895. Hallé exercised an important influence in the musical education of England; if his pianoforte-playing, by which he was mainly known to the public in London, seemed remarkable rather for precision than for depth, for crystal clearness rather than for warmth, and for perfect realization of the written text rather than for strong individuality, it was at least of immense value as giving the composer's idea with the utmost fidelity. Those who were privileged to hear him play in private, like those who could appreciate the power, beauty and imaginative warmth of his conducting, would have given a very different verdict; and they were not wrong in judging Hallé to be a man of the widest and keenest artistic sympathies, with an extraordinary gift of insight into music of every school, as well as a strong sense of humour. He fought a long and arduous battle for the best music, and never lost the certainty of his art. In spite of the fact that his technique was that of his youth, of the period before Liszt, the ease and certainty he attained in the most modern music was not the less wonderful because he concealed the mechanical means so completely.

Lady Hallé, who from 1864 onwards had been one of the leading solo violinists of the time, was constantly associated with her husband on the concert stage till his death; and in 1866 a public subscription was organized in her behalf, under royal patronage. She continued to appear occasionally in public, notably as late as 1907, when she played at the Joachim memorial concert. In 1901 she was given by Queen Alexandra the title of "violinist to the queen." A fine classical player and artist, frequently associated with Joachim, Lady Hallé was the first of the women violinists who could stand comparison with men.

HALLE (known as HALLE-ANDER-SALEE, to distinguish it from the small town of Halle in Westphalia), a town of Germany, in the Prussian province of Saxony, situated in a sandy plain on the right bank of the Saale, which here divides into several arms, the Halle on the left, and the Saale itself, which flows through Magdeburg. Pop. (1875), 66,593; (1885) 81,982; (1895) 116,304; (1901) 166,111. Owing to its situation at the junction of six important lines of railway, bringing it into direct communication with Berlin, Breslau, Leipzig, Frankfort-on-Main, the Harz country and Hanover, it has greatly developed in size and in commercial and industrial importance. It consists of the old, or inner, town surrounded by promenades, which occupy the site of the former fortifications, and beyond these of two small towns, Glaucha in the south and Neumarkt in the north, and five rapidly increasing suburbs. The inner town is irregularly built and presents a somewhat unattractive appearance, but it has been much improved and modernized by the laying out of new streets. The centre of the town proper is occupied by the imposing market square, on which stand the fine medieval town hall (restored in 1883) and the handsome Gothic Marienkirche, dating mainly from the 16th century, with two towers connected by a bridge. In the middle of the square are a clock-tower (Der rote Turm) 276 ft. in height, and a bronze statue of Handel, the composer, a native of Halle. West of the market-square lies the Halle, which the breime sprang (see below). Among the eleven churches, nine Protestant and two Roman Catholic, may also be mentioned the St Moritzkirche, dating from the 12th century, with fine wood carvings and sculptures, and the cathedral (belonging since 1689 to the Reformed or Calvinistic church), built in the 16th century and containing an altar-piece representing Duke Augustus of Saxony and his family. Of secular buildings the most noticeable are the ruins of the castle of Moritzburg, formerly a citadel and the residence of the archbishops of Magdeburg, destroyed by fire in the Thirty Years' War, and afterwards occupied by them for military purposes, the university buildings, the theatre and the new railway station. The famous university was founded by the elector Frederick III. of Brandenburg (afterwards king of Prussia), in 1694, on behalf of the jurist, Christian Thomasius (1655-1728), whom many students followed to Halle, when he was expelled from Leipzig through the enmity of his fellow professors. It was closed by Napoleon in 1806 and again in 1813, but in 1815 was re-established and augmented by the removal to it of the university of Wittenberg, with which it thus became united. It has faculties of theology, law, medicine and philosophy. From the first it has been recognized as one of the principal seats of Protestant theology, originally of the pietistic and latterly of the rationalistic and critical school. In connexion with the university there are a botanical garden, a theological seminary,
anatomical, pathological and physical institutes, hospitals, 
an agricultural institute—one of the foremost institutions of 
the kind in Germany—a meteorological institute, an 
observatory and a library of 180,000 printed volumes and 800 
manuscripts. Among other educational establishments must 
be mentioned the Francke'sche Stiftungen, founded in 1691 by August Hermann 
Francke (1663–1727), a member of the famous and 
broad-minded Lutheran elector's family; the Junkertrakt or 
former court of the building. They embrace 
an orphanage, a laboratory where medicines are prepared 
and distributed, a Bible press from which Bibles are issued at a 
cheaper rate, and eight schools of various grades, attended in all by 
over 3000 pupils. The other principal institutions are the city 
gymnasium, the provincial lunatic asylum, the prison, the town 
hospital and infirmary, and the deaf and dumb institute. 
The salt-springs of Halle have been known from a very early period. 
Some rise within the town and others on an island in the 
Saale; and together their annual yield of salt is about 8500 
tons. 
The workmen employed at the salt-works are of a peculiar race 
and are known as the Halloren. They have been usually regarded 
as descendants of the original Wendish inhabitants, or as Celtic 
immigrants, with an admixture of Frankish elements. They 
wear a distinct dress, the ordinary costume of about 1700, 
observe several ancient customs, and enjoy certain exemptions 
and privileges derived from those of the ancient Pfannenmeister 
(community of the patricians). Other industries of Halle are sugar refining, machine 
building, the manufacture of spirits, malt, chocolate, cocoa, 
confectionery, cement, paper, chicory, lubricating and illuminating 
oil, wagon grease, carriages and playing cards, printing, 
dyeing and coal mining (soft brown coal). The trade, which 
is supervised by a chamber of commerce, is very considerable, 
the principal exports being machinery, raw sugar and petroleum. 
Halle is also noted as the seat of several important publishing 
firms. The Biblienanstalt (Bible institution) of von Castein is the central 
authority for the revision of Luther's Bible, of which it 
sells annually from 60,000 to 70,000 copies. 

Halle is first mentioned as a fortress erected on the Saale in 
806 by Charles, son of Charlemagne, during his expedition against 
the Sorbs. The place was, however, known long before, and owes 
its origin as well as its name to the salt springs (Halais). In 906 Halle, 
in the wealthy salt works, was given by the emperor Otto I. to 
the newly founded archbishop of Magdeburg, and in 987 Otto II. 
gave it a charter as a town. The interests of the archbishop were 
watched over by a Vogt (advocatus) and a burggrave, and from 
the time of the Barons' War the Halais became a part of the 
Germans. early settlers in the town, the former being under that of 
Salzgraf (comes salis), the latter of a Schultheiss or bailiff, 
both subordinate to the burggrave. The conflict of interests and juris-
dictions led to the usual intestine troubles. 
The patrician panners (Pfannen) of the town, 
patrician offices or officials, became a close 
hereditary aristocracy in perpetual rivalry with the gilds in the town; 
and both resisted the claims of the archbishops. At 
the beginning of the 12th century Halle had attained considerable 
importance, and in the 13th and 14th centuries as a member of 
the Hanseatic League it carried on successful wars with the 
archbishops of Magdeburg; and in 1435 it resisted an army of 30,000 men under 
the elector of Saxony. Its liberty perished, however, as a result 
of the internal feud between the democratic gilds and the patrician 
panners. On the 20th of September 1478 a demagogue and 
cobbler named Wenzel von Bellin flew against the council 
and the patricians and confederates opened the gates to the soldiers of the 
archbishops. The townsfolk were subdued, and to hold them in check the archbishop, 
Ernest of Saxony, built the castle of Moritzburg. Notwithstanding 
the efforts of the archbishops of Mainz and Magdeburg, the Reformation 
found an entrance into the city in 1522; and in 1544 a 
Lutheran superintendent was appointed. After the peace of West-
phalia in 1648 the city came into the possession of the house of 
Brandenburg. In 1806 it was stormed and taken by the French, 
but after, which, at the peace of Tilsit, it was united to the new kingdom 
of Westphalia, it was detached by the Prussians in 1813, 
and in May 1813, it was taken by the Russians. The rise of Leipzig 
was for a long time hurtful to the prosperity of Halle, and its present 
rapid increase in population and trade is principally due to its position 
as the growth of railway traffic.

HALLECK, FITZ-GREENE (1790–1867), American poet, was 
born at Guilford, Connecticut, on the 8th of July 1790. By 
his mother he was descended from John Eliot, the Apostle of the 
Sorbs. At an early age he attended a school near Halleford, 
and in 1811 he entered a banking-house in New York. 
Having made the acquaintance of Joseph Rodman Drake, in 
1819 he assisted him under the signature of "Croaker junior" 
in contributing to the New York Evening Post the humorous series of 
" Croaker Papers." In 1821 he published his longest poem, 
"Fanny," a satire on local politics and fashions in the measure 
of Byron's *Don Juan.* He visited Europe in 1822–1823, and after 
his return published anonymously in 1827 *Alnwick Castle,* with 
other Poems. From 1832 to 1841 he was a confidential agent 
of John Jacob Astor, who named him one of the trustees of the 
Astor Library. In 1864 he published in the *New York Ledger* 
a poem of 300 lines entitled "Young America." He died at 
Guilford, on the 19th of November 1867. The poems of Halleck 
are written with great care and finish, and manifest the possession 
of a fine sense of harmony and of genial and elevated sentiments. 
*His Life and Letters,* by James Grant Wilson, appeared in 1869. 
*His Poetical Writings,* together with extracts from those of Joseph 
Rodman Drake, were published in the same year. A later edition 
of this work was widely used as a text-book by 
volunteer officers during the Civil War. On the outbreak of 
the Mexican War in 1846, he served with the expedition to California 
and the Pacific coast, in which he distinguished himself not only 
as an engineer, but by his skill in civil administration and by his 
good conduct before the enemy. He served for several years 
in California as a staff officer, and as secretary of state under the 
military government, and in 1849 he helped to frame the state 
constitution of California, on its being admitted into the Union. 
In 1852 he was appointed inspector of the telegraph line of California, 
and in 1853 was employed in the fortification of the Pacific 
coast. In 1854 Captain Halleck resigned his commission and 
took up the practice of law with great success. He was also 
director of a quicksilver mine, and in 1858 he became president 
of the Pacific & Atlantic railway. On the outbreak of the Civil 
War he returned to the army as a major-general, and in 
November 1861 he was charged with the supreme command 
in the western theatre of war. There can be no question that 
his administrative skill was mainly instrumental in bringing order 
in the chaos existing in the department of the Missouri 
in 1861, but the strategical and tactical successes of the following 
spring were due rather to the skill and activity of his subordinate 
generals Grant, Buell and Pope, than to the plans of the supreme 
commander, and when he assumed command of the united forces 
of these three generals before Corinth, the methodical slowness 
of his advance aroused much criticism. In July, however, he 
was called to Washington as general-in-chief of the armies. At 
headquarters his administrative powers were conspicuous, but 
proved to be utterly wanting in any large grasp of the 
military problem; the successive reverses of Generals McClellan, 
Pope, Burnside and Hooker in Virginia were not infrequently 
traceable to the defects of the general-in-chief. No ordination 
of the military efforts of the Union was seriously undertaken by 
Halleck, and eventually in March 1864 Grant was appointed to
HÄLLEFLINTA—HALLER, A. VON

replace him, Major-General Halleck becoming chief of staff at Washington. This post he occupied with credit until the end of the war. In April 1865 he held the command of the military division of the James and in August of the same year of the military division of the Pacific, which he retained till June 1866, when he was transferred to that of the South, a position he held till his death at Louisville, Ky., on the 9th of January 1872. Halleck's position as a soldier is easily defined by his uniform success as an administrative official, his equally uniform want of success as an officer at the head of large armies in the field, and the popularity of his theoretical writings on war. His influence, for good or evil, on the course of the greatest war of modern times was greater than that of any soldier on either side, save Grant and Lee, and whilst his interference with the dispositions of the commanders in the field was often disastrous, his services in organizing and instructing the Union forces were always of the highest value, and in this respect he was indispensable.

Besides Military Art and Science, Halleck wrote Bitumen, its Varieties, Properties and Uses (1841); The Mining Laws of Spain and Mexico (1845); International Law (1861; new edition, 1880); and Treatise on International Law and the Laws of War, prepared for the use of Schools and Colleges, abridged from the larger work. He translated Jomini's Vie politique et militaire de Napoléon (1864) and de Fontenelle's Histoire des Mers (1868). His works on international law mentioned above entitle General Halleck to be considered as one of the great jurists of the 19th century.

HÄLLEFLINTA (a Swedish word meaning rock-flint), a white, grey, yellow, greenish or pink, fine-grained rock consisting of an intimate mixture of quartz and felspar. Many examples are banded or striated; others contain porphyritic crystals of quartz which resemble those of the felsites and porphyries. Mica, iron oxides, apatite, zircon, epidote and hornblende may also be present in small amount. The more micaceous varieties form the fine-grained slate of gneis and gneiss. Hälleflinta under the microscope is very finely crystalline, or even cryptocrystalline, resembling the felsitic matrix of many acid rocks. It is essentially metamorphic and occurs with gneisoses, schists and granulites, especially in the Scandinavian peninsula, where it is regarded as being very characteristic of certain horizons. Of its original nature there is some doubt, but its chemical composition and the occasional presence of porphyritic crystals indicate that it has affinities to the fine-grained intrusive rocks. In this group there may also have been placed metamorphosed and tuffaceous sediments, originally of a clayey or siltstone nature, altered by intrusions of diabase. The assemblage is not a perfectly homogeneous one but includes both igneous and sedimentary rocks, but the former preponderate. Rocks very similar to the typical Swedish hälleflintas occur in Tirol, in Galicia and eastern Bohemia.

HALLEL (Heb. הַלֶּלֶה 'to praise'), a term in Jewish liturgy for (a) Psalms cxiii.-cxviii., often called "the Egyptian Hallel" because of its recitation during the paschal meal on the night of the Passover, (b) Psalm cxxxvi., "the Great Hallel." C.A. Briggs points out that the term "Hallelujah" ('Praise ye Yah') is found at the close of Ps. civ., cv., cxv., cxvi., cxvii., at the beginning of Pss. cxi., cxxi. and at both ends of Pss. cvi., cxxxi., cxxv., cxxvi., cxxvii. The Septuagint also gives it at the beginning of Ps. cv., cxi., cxxi., cxxvi., to cxxvii. There are thus four groups of Hallel psalms:—cif.-civ. (a tetalogy on creation, the patriarchal age, the Exodus, and the Restoration); cxi.-civ. which includes most of the 'Egyptian Hallel'; cxxv.-cxxxvi.; cxxvi.-civ. All of these Hallels (except cxxxvi. and cxxii. which are not in the English Version) are the fruit of the collective labor of sixteenth psalms composed for public use by the choirs, especially at the great feasts. Their distribution into four groups was the work of the final editor of the psalter. Later liturgical use regarded Pss. cxxxvi. and even cxxi. as Hallels, as well as Pss. cxx. to cxxxv.

It will be observed that the extent of the official Hallel varied from time to time. It would appear that in the time of Gamaliel

HALLER, ALCBRECHT VON (1708-1777), Swiss anatomist and physiologist, was born of an old Swiss family at Bern, on the 16th of October 1708. Prevented by long-continued ill-health from taking part in boisterous sports, he had the more opportunity for the development of his precocious mind. At the age of four, it is said, he used to read and expound the Bible to his father's servants; before he was ten he had sketched a Chaldee grammar, the so-called, and besides a Latin dictionary, and a collection of two thousand biographies of famous men and women on the model of the great works of Bayle and Moreri, and written in Latin verse a satire on his tutor, who had warned him against a too great excursiveness. When still hardly fifteen he was already the author of numerous metrical translations from Ovid, Horace and Virgil, as well as of original lyrics, dramas, and an epic of four thousand lines on the origin of the Swiss confederations, writings which he is said on one occasion to have rescued from a fire at the risk of his life, only, however, to burn them a little later (1727) with his own hand. Haller's attention had been directed to the profession of medicine while he was residing in the house of a physician at Biel after his father's death in 1721; and, following the choice then made, he while still a sickly and excessively shy youth went in his sixteenth year to the university of Tübingen (December 1723), where he studied under Camerarius and Duvernoy. Dissatisfied with his progress, he in 1725 exchanged Tübingen for Leiden, where Boerhaave was in the zenith of his fame, and where Albinus had already begun to lecture in anatomy. At that university he graduated in May 1727, undertook successfully in his thesis to prove that the saliva was nothing more than a blood-vessel. Haller then visited London, making the acquaintance of Sir Hans Sloane, Cheselden, Pringle, Douglas and other scientific men; next, after a short stay in Oxford, he visited Paris, where he studied under Ledran and Winslow; and in 1728 he proceeded to Basel, where he devoted himself to the study of the higher mathematics under John Bernoulli. It was during his stay there also that his first great interest in botany was awakened; and, in the course of a tour (July—August, 1728), through Savoy, Baden and several of the Swiss cantons, he began a collection of plants which was afterwards the basis of his great work on the flora of Switzerland. From a literary point of view the main result of this, the first of his many journeys through the Alps, was his poem entitled Die Alpen, which was finished in March 1729, and appeared in the first edition (1732) of his Gedichte. This poem of 490 hexameters is historically important as one of the earliest signs of the awakening appreciation of the mountains (hitherto generally regarded as horrible monstrosities), though it is chiefly designed to contrast the simple and idyllic life of the farmers of the Alps with the corrupt and decadent existence of the dwellers in the plains.

In 1729 he returned to Bern and began to practise as a physician; his best energies, however, were devoted to the botanical and anatomical researches which rapidly gave him a European reputation, and procured for him from George II.

* The reference to a hymn at the institution of the Eucharist (Matt. xxvi. 30, Mark xiv. 26) must be interpreted in the light of this inceptive stage of the Hallel.
in 1736 a call to the chair of medicine, anatomy, botany and surgery in the newly founded university of Göttingen. He became P.R.S. in 1743, and was ennobled in 1749. The quantity of work achieved by Haller in the seventeen years during which he occupied his Göttingen professorship was immense. Apart from the ordinary work of his classes, which entitled him to the task of newly organizing a botanical garden, an anatomical theatre and museum, an obstetrical school, and similar institutions, he carried on without interruption those original investigations in botany and physiology, the results of which are preserved in the numerous works associated with his name; he continued also to persevere in his youthful habit of publishing observations which at the same time he conducted a monthly journal (the Göttingische gelehrte Anzeigen), to which he is said to have contributed twelve thousand articles relating to almost every branch of human knowledge. He also warmly interested himself in most of the religious questions, both ephemeral and permanent, of his day; and the erection of the Reformed church in Göttingen was mainly due to his unwearied energy. Notwithstanding all this variety of absorbing interests he never felt at home in Göttingen; his untravelled heart kept turning towards his native Bern (where he had been elected a member of the great council in 1745), and in 1753 he resolved to resign his chair and return to Switzerland.

The twenty-one years of his life which followed were largely occupied in the discharge of his duties in the minor political post of a Rathhausammann which he had obtained by lot, and in the preparation of his Bibliotheca medica, the botanical, surgical and anatomical parts of which he lived to complete; but he also found time to write the three philosophical romances—Usong (1771), Alfred (1773) and Fabius and Cato (1774), in which his views as to the respective merits of despotic government, of limited monarchy and of aristocratic republican government are fully set forth. About 1773 the state of his health rendered necessary his entire withdrawal from public business; for some time he supported his failing strength by means of opium, on the use of which he communicated a paper to the Proceedings of the Göttingen Royal Society in 1776; the excessive use of the drug is believed, however, to have hastened his death, which occurred on the 17th of December 1777. Haller, who had been three times married, left eight children, the eldest of whom, Gottlieb Emanuel, attained to some distinction as a botanist and as a writer on Swiss historical biography (1785-1788, 7 vols.).

Subjoined is a classified but by no means an exhaustive list of his very numerous works in various branches of science and literature (a complete list of all his writings, including the various editions, was published by Haller himself, in 1775, at the end of vol. 6 of the correspondence addressed to him by various learned friends):—

(1) Anatomical—Icones anatomie (1743-1754); Dissectiones anatomie selectiores (1746-1752); and Opera acad. minora anatomice argument (1762-1768). (2) Physiological—De respirazione experimenta anatomica (1747); Prima lineae physiologicae (1747); and Elementa physiologicu corporis humanis (1755-1760). (3) Pathological and surgical—Opuscula physiatica (1754);—Dissectionum chirurgic, collectio (1777); also careful editions of Boerhaave’s Prælectiones academicae in institutiones rei medicae (1759), and of the Artis medicæ principia of the same author (1746). (4) Botanical—Enumeratio methodica stirpium Helvetiarum (1742);—Opuscula botanica (1749);—Bibliotheca botanica (1771). (5) Historical and critical—Briefe über die wichtigsten Wahrheiten der Offenbarung (1772); and Briefe zur Vertheidigung der Offenbarung (1775-1777). (6) Poetical—Gedichte (1732, 12th ed., 1777). His three romances have already been mentioned. Several volumes of lectures and Tagebcher or journals were published posthumously. See J. G. Zimmermann, Das Leben des Herrn von Haller (1775), and the articles for Förster and Seiler in Ersch and Gruber’s Encyklopädie, and particularly the detailed biography (over 500 pages) by L. Haller, prefixed at the head of his elaborate edition (Frauenfeld, 1882) of Haller’s Gedichte.

HALLER, BERTHOLD (1493-1536), Swiss reformer, was born at Aldingen in Württemberg, and after studying at Pforzheim, where he met Melanchthon, and at Cologne, taught in the gymnasium at Bern. He was appointed assistant preacher at the time of the reforming party in 1495 at Berne. Even before his acquaintance with Zwingli in 1521 he had begun to preach the Reformation, his sympathetic character and his eloquence making him a great force. In 1526 he was at the abortive conference of Baden, and in January 1528 drafted and defended the ten theses for the conference of Bern which established the new religion in that city. He left no writings except a few letters which are preserved in Zwingli’s works. He died on the 25th of February 1536.

Life by Pestalozzi (Elberfeld, 1861).

HALLEY, EDMUND (1656-1742), English astronomer, was born at Haggerston, London, on the 29th of October 1656. His father, a wealthy soapboiler, placed him at St Paul’s school, where he was equally distinguished for classical and mathematical ability. At the age of nineteen, Haller discovered that the planets were not moving in perfect ellipses, but that the parabolic form was in reality a more adequate representation of the real tracks. He was at once put to the task of explaining this new fact, and the result of his labours was published in the Philosophical Transactions of the Royal Society for 1676. This discovery was so important, and was so promptly understood, that the letter of communication was at once translated by Charles II. to the East India Company, and procured for him an apparently suitable situation, though, as it proved, ill-chosen station, and in November 1676 he embarked for St Helena. On the voyage he noticed the retardation of the pendulum in approaching the equator; and during his stay on the island he observed, on the 7th of November 1677, a transit of Mercury, which suggested to him the important idea of employing similar phenomena for determining the sun’s distance. He returned to England in November 1678, having by the registration of 341 stars won the title of the ‘Southern Tycho,’ and by the translation to the heavens of the “Royal Oak,” earned a degree of master of arts, conferred at Oxford by the king’s command on the 3rd of December 1678, almost simultaneously with his election as fellow of the Royal Society. Six months later, the indefatigable astronomer started for Denmark to set at rest a dispute of long standing between Hooke and Hevelius as to the respective merits of plain or telescopic sights; and towards the end of 1680 he proceeded on a continental tour. In Paris he observed, with G. D. Cassini, the great comet of 1680 after its perihelion passage; and having returned to England, he married in 1682 Margarita, daughter of John Tooke, auditor of the exchequer, with whom he lived harmoniously for fifty-five years. He now fixed his residence at Islington, engaged chiefly upon lunar observations, with a view to the great desideratum of a method for finding the longitude at sea. His mind, however, was also busy with the momentous problem of gravity. Having reached so far as to perceive that the central force of the solar system must decrease inversely as the square of the distance, and applied vainly to Wren and Hooke for further elucidation, he made in August 1684 that journey to Cambridge for the purpose of consulting Newton, which resulted in the publication of the Principia. The labour and expense of passing this great work through the press devolved upon Halley, who also wrote the prefixed hexameters ending with the well-known line—

Nec fas est propius mortali attingere diuros.

In 1696 he was, although a zealous Tory, appointed deputy comptroller of the mint at Chester, and (August 10, 1698) he received a commission as captain of the "Paramour Pink" for the purpose of making extensive observations on the conditions of terrestrial magnetism. This task he accomplished in a voyage which lasted two years, and extended to the 52nd degree of S. latitude. The results were published in a General Chart of the Variation of the Compass in 1701; and immediately afterwards he executed by royal command a careful survey of the tides and coasts of the British Channel, an elaborate map of which he produced in 1702. On his return from a journey
HALLGRÍMSSON, Hallow’een

DOCTOR OF LAWS IN 1710. BETWEEN 1713 AND 1721 HE ACTED AS SECRETARY TO THE ROYAL SOCIETY, AND EARLY IN 1720 HE SUCCEEDED Flamsteed AS ROYAL ASTRONOMER. ALTHOUGH IN HIS SIXTIETH YEAR, HE UNDERTOOK TO OBSERVE THE MOON THROUGH AN ENTIRE REVOLUTION OF HER NODES (EIGHTEEN YEARS), AND ACTUALLY CARRIED OUT HIS PURPOSE. HE DIED ON THE 14TH OF JANUARY 1742. HIS TOMB IS IN THE OLD GRAVEYARD OF ST. MARGARET’S CHURCH, LEEK, KENT.

Halle’s most notable scientific achievements were—his detection of the “long inequality” of Jupiter and Saturn, and of the acceleration of the mean motion of one of the fixed stars (1718), his theory of variation (1698), including the hypothesis (rejected by Laplace) that the sun is the same as Jupiter and Saturn, and its suggestion of the magnetic origin of the aurora borealis; his calculation of the orbit of the 182 comet (the first ever attempted), coupled with a prediction of its return, strikingly verified in 1750; and his indication (first in 1769, and again in 1716, Phil. Trans., No. 348) of a method extensively used in the 18th and 19th centuries for determining the solar parallax by means of the transits of Venus.

His principal works are Catalogus stellarum australium (London, 1679), the substance of which was embodied in vol. ii. of Historia coelestis (1720); Historiae astronomicae, secundae, comitatae (Oxford, 1705); Astronomical Tables (London, 1725); also eighty-one miscellaneous papers of considerable interest, scattered through the Philosophical Transactions. To these should be added his version of a tract in the Arabic (which language he acquired for the purpose) of the treatise of Apollonius De sectione rationis, with a restoration of his two lost books De sectione spati, both published at Oxford in 1706; also ‘On the Conic Sections,’ which he published in 1732, with an appendix by Serenus De sectione cyindri et coni (Oxford, 1710, folio). His edition of the Sphæres of Menelæus was published by his friend Dr Costard in 1758. See also Biographia Britannica, iv. (1757); Gent. Mag. xvi. 455, 503; A. Wood, Athenae Oxoni. (Bliss), iv. 536; J. Aubrey, Life, ii. 365; F. Baily, Account of Flamsteed; Sir D. Brewster, Life of Newton; R. Grant, History of Astronomy, p. 477 and passim; A. J. Rudolph, Bulletin of Bibliographie, N.Y. (1904); E. F. McPike, “Bibliography of Halle’s Comet,” Smithson. Misc. Collections, xiv. pt. i. (1905); Notes and Queries, 9th series, vols. x. xi. xii., 10th series, vol. ii. (E. F. McPike), containing some important observations regarding the Rigaud papers in the Bodleian library, Oxford; and of many of his unpublished letters exist at the Record Office and in the library of the Royal Society. (A. M. C.)

HALLGRÍMSSON, Jónas (1807–1844), the chief lyrical poet of Iceland, was born in 1807 at Steinstaðir in Eyjafjarðarsýsla in the north of that island, and educated at the famous school of Bessastaðir. In 1832 he went to the University of Copenhagen, and shortly afterwards turned his attention to the natural sciences, especially geology. Having obtained pecuniary assistance from the Danish government, he travelled through all Iceland for scientific purposes in the years 1837–1842, and made many interesting geological observations. Most of his writings on geology are in Danish. His renown was, however, not acquired by his writings in that language, but by his Icelandic poems and short stories. He was well read in German literature, Heine and Schiller being his favourites, and the study of the German masters and the old classical writers of Iceland opened his eyes to the corrupt state of Icelandic poetry and showed him the way to make it better. The misuse of the Eddic metaphors made the lyrical and epic poetry of the day hardly intelligible, and, to make matters worse, the language of the poets was mixed up with words of German and Danish origin. The great Danish philologist and friend of Iceland, Rasmus Rask, and the poet Bjarni Thórarssen had done much to purify the language, but Jónas Hallgrímsson completed their work by his poems and tales, in a purer language than ever had been written in Iceland since the days of Snorri Sturluson. The excesses of Icelandic poetry were specially seen in the so-called rimur, ballads of heroes, &c., which were fiercely attacked by Jónas Hallgrímsson, who at last succeeded in converting the educated to his view. Most of the principal poems, tales and essays of Jónas Hallgrímsson appeared in the periodical Fjöður, which he began publishing at Copenhagen in 1835; together with Konráð Gíslason, a well-known philologist, and the patriotic Thómas Saemundsson. Fjöður had in the beginning a hard struggle against old prejudices, but as the years went by its influence became enormous; and when it at last ceased, its programme and spirit still lived in Nýs Ægislæti and other patriotic periodicals which took its place. Jónas Hallgrímsson, who died in 1844, is the father of a separate school in Icelandic lyric poetry. He introduced foreign thoughts and metres, but at the same time revived the metres of the Icelandic classical poets. Although his poetical works are all comprised in one small volume, he strikes every string of the old harp of Iceland.

HALLSTATT—HALLUCINATION

this festival Saman, lord of death, called together the wicked souls that within the past twelve months had been condemned to inhabit the bodies of animals. Thus it is clear that the main celebrations of Hallowe'en were purely Druidical, and this is further proved by the fact that in parts of Ireland the 31st of October was, and even still is, known as Oidhche Shamhna, "Vigil of Saman." On the Druidic ceremonies were grafted some of the characteristic japes, axes, helmets, bosses and plait of the latter held about the 1st of November, in which nuts and apples, as representing the winter store of fruits, played an important part. Thus the roasting of nuts and the sport known as "apple-ducking"—attempting to seize with the teeth an apple floating in a tub of water—were once the universal occupation of the young folk in medieval England on the 31st of October. The custom of lighting Hallowe'en fires survived until recent years in the highlands of Scotland and Wales. In the dying embers it was usual to place as many small stones as there were persons around, and next morning a search was made. If any of the pebbles were displaced it was regarded as certain that the person represented would die within the twelve months.

For details of the Hallowe'en games and bonfires see Brand's Antiquities of Great Britain; Chambers's Book of Days; Grimm's Deutsche Mythologie, ch. xx (Elemente) and ch. xxxiv. (Aberglaube); and J. G. Frazer's Golden Bough, vol. iii. Compare also Beltane and Bonfire.

HALLSTATT, a market-place of Austria, in Upper Austria, 67 m. S.S.W. of Linz by rail. Pop. (1900) 737. It is situated on the shore of the Hallstätter Salzberg, and is built in amphitheatrical houses clinging to the mountain side. The salt mine of Hallstatt, which is one of the oldest in existence, was rediscovered in the 14th century. In the neighbourhood is the celebrated Celtic burial ground, where a great number of very interesting antiquities have been found. Most of these have been removed to the museums at Vienna and Linz, but some are kept in the local museum.

The excavations (1847-1864) revealed a form of culture hitherto unknown, and accordingly the name Hallstatt has been applied to objects of like form and decoration since found in Styria, Carniola, Bosnia (at Glasinatz and Jezerin), Epirus, north Italy, France, Spain and Britain (see Celt). Everywhere else the change from iron weapons to bronze is immediate, but at Hallstatt iron is seen gradually superseding bronze, first for ornament, then for edging cutting instruments, then replacing fully the old bronze types, and finally taking new forms of its own. There can be no doubt that the use of iron first developed in the Hallstatt area, and that hence it spread southwards into Italy, Greece, the Aegean, Egypt, and at the front of the Hallstatt and westwards in Europe. At Noreia, which gave its name to Noricum (q.v.) less than 40 m. from Hallstatt, were the most famous iron mines of antiquity, which produced the Noric iron and Noric swords so prized and dreaded by the Romans (Pliny, Hist. Nat. xxxiv. 145; Horace, Epod. 17. 71). This iron needed no tempering, and the Celts had probably found it ready smelted by nature, just as the Eskimo had learned of themselves to use telluric iron embedded in basalt. The graves at Hallstatt were partly inhumation partly cremation; they contained swords, daggers, axes, ornaments, and the latter and the former; while those of the men had swords, axes, helmets, bosses and plates of shields and hauberks, brooches, various forms of jewelry, amber and glass beads, many of the objects being decorated with animals and geometrical designs. Silver was practically unknown. The weapons and axes are mostly iron, a few being bronze. The swords are leaf-shaped, with blunt points intended for cutting, not for thrusting; the hilts differ essentially from those of the Bronze Age, being shaped like a crescent to grasp the blade, with large pommels, or sometimes with antennae (the latter found also in Bavaria, Württemberg, Baden, Switzerland, the Pyrenees, Spain, and north Italy): only six arrowheads (bronze) were found. Both flanged and socketed celts occurred, the iron being much more numerous than the bronze. The flat axes are distinguished by the side stops and in some cases the transition from paitslave to socketed axe can be seen. The shields were round as in the early Iron Age of north Italy (see Villanova). Graves were found at Glasinatz and Jezerin, though not at Hallstatt; two helmets were found at Hallstatt and others in Bosnia; broad bronze belts were numerous, adorned in repoussé with beast and geometric ornament. Brooches are found in great numbers, both those derived from the primitive safety-pin ("Peschiera" type) and the "spectacles" or "Hallstatt" type found all down the Balkans and in Greece. The latter are formed of two spirals of wire, sometimes four such spirals being used, whilst there were also brooches in animal forms, one of the latter being found with a bronze sword. The Hallstatt culture is that of the Homeric Achaians (see Achaeans), but as the brooch (along with iron, cremation of the dead, the round shield and the geometric ornament) passed down into Greece from central Europe, and as brooches are found in the lower town at Mycenae, 1350 B.C., they must have been invented long before that date in central Europe. But as they are found in the late Bronze Age and early Iron Age, the early iron culture of Hallstatt must have originated long before 1350 B.C., a conclusion in accord with the absence of silver at Hallstatt itself.

HALLUCINATION (from Lat. alucinari or allucinari, to wander in mind, Gr. ἀλυσεως or ἀλέγεω, from ἀλης, wandering), a psychological term which has been the subject of much controversy, and to which, although there is now fair agreement as to its denotation, it is still impossible to give a precise and entirely satisfactory definition. Hallucinations constitute one of the two great classes of all false sense-perceptions, the other class consisting of the "illusions," and the difficulty of definition is clearly to mark the boundary between the two classes. Illusion may be defined as the misinterpretation of sense-impression, while hallucination, in its typical instances, is the experiencing of a sensory presentation, i.e. a presentation having the sensory vividness that distinguishes perceptions from representative imagery, at a time when no stimulus is acting on the corresponding sense-organ. There is, however, good reason to think that in many cases, possibly in all cases, some stimulation of the sense-organ, coming either from without or from within the body, plays a part in the genesis of the hallucination. This being so, we must be content to leave the boundary between illusions and hallucinations ill-defined, and to regard as illusions those false perceptions in which impressions made on the sense-organ play a leading part in determining the character of the percept, and as hallucinations those in which any such impression is lacking, or plays but a subsidiary part and bears no obvious relation to the character of the false percept.

As in the case of illusion, hallucination may or may not involve delusion, or belief in the reality of the object falsely perceived. Among the sane the hallucinatory object is frequently recognized at once as unreal or at least as but quasi-real; and it is only the insane, or persons in abnormal states, such as hypnosis, who, when an hallucination persists or recurs, fail to recognize that it corresponds to no physical impression from, or object in, the outer world. Hallucinations of all the senses occur, but the most commonly reported are the auditory; and these are quite different from those seen in sleep, and so appear to be quite rare. This apparent difference of frequency is no doubt largely due to the more striking character of visual and auditory hallucinations, and to the relative difficulty of ascertaining, in the case of perceptions of the lower senses, e.g. of taste and smell, that no impression adequate to the genesis of the percept has been made upon the sense-organ; but, in so far as it is real, it is probably due in part to the more constant use of the higher senses and the greater strain-consequently thrown upon them, in part also to their more intimate connexion with the life of ideas.

The hallucinatory perception may involve two or more senses, e.g. the subject may seem to see a human being, to hear his voice and to feel the touch of his hand. This is rarely the case in spontaneous hallucination, but in hypnotic hallucination the
subject is apt to develop the object suggested to him, as present to one of his senses, and to perceive it also through other senses. Among visual hallucinations the human figure, and among auditory hallucinations human voices, are the objects most commonly perceived. The figure seen always appears localized more or less definitely in the outer world. In many cases it appears related to the objects truly seen in just the same way as a real object; e.g. it is no longer seen if the eyes are closed or turned away, it does not move with the movements of the eyes, and it may hide objects lying behind it, or be hidden by objects coming between the place that it appears to occupy and the eye of the percipient. Visual hallucinations are most often experienced when the eyes are open and the surrounding space is well or even brightly illuminated. Less frequently the visual hallucination takes the form of a self-luminous figure in a dark place or appears in a luminous globe or mist which shuts out from view the real objects of the part of the field of view in which it appears. Auditory hallucinations, especially voices, seem to fall into two distinct classes—(1) those which are heard as coming from without, and are more or less definitely localized in outer space, (2) those which seem to be within the head or, more directly, within the cheating organs. Visual hallucinations are principally kinaesthetic sensations, sensations of movement of the organs of speech. Hallucinations occur under a great variety of bodily and mental conditions, which may conveniently be classified as follows.

I. Conditions which imply normal waking consciousness and no distinct departure from bodily and mental sanity.

a. It would seem that a considerable number of perfectly healthy persons occasionally experience, while in a fully waking state, hallucinations for which no cause can be assigned. The census of hallucinations conducted by the Society for Psychical Research showed that about 10% of all sane persons can remember having experienced at least one hallucination while they believed themselves to be fully awake and in normal health. These sporadic hallucinations of waking healthy persons are far more frequently visual than auditory, and they usually take the form of some familiar person in ordinary attire. The figure in many cases is seen, on turning the gaze in some new directions, fully developed and lifelike, and its hallucinatory character may be revealed only by its noiseless movements, or by its fading away in situ. A special interest attaches to hallucinations of this type, owing to the occasional coincidence of the death of the person with his hallucinatory appearance. The question raised by these coincidences will be discussed in a separate paragraph below.

b. A few persons, otherwise normal in mind and body, seem to experience repeatedly some particular kind of hallucination. The voice (gauvóáv) so frequently heard by Socrates, warning or advising him, is the most celebrated example of this type.

II. Conditions more or less unusual or abnormal but not implying distinct departure from health.

a. A kind of hallucination to which perhaps every normal person is liable is that known technically as “recurring sensations.” This kind is experienced only when some sense-organ has been continuously or repeatedly subjected to some one kind of impression or stimulation for a considerable period; e.g. the microscopist, after examining for some hours one particular kind of object or structure, may suddenly perceive the object faithfully reproduced in form and colour, and lying, as it were, upon any surface to which his gaze is directed. Perhaps the commonest experience of this type is the recurrence of the sensations of movement at intervals in the period following a sea voyage or long railway journey.

b. A considerable proportion of healthy sane persons can induce hallucinations of vision by gazing fixedly at a polished surface or into some dark translucent mass; or of hearing, by applying a large shell or similar object to the ear. These methods of inducing hallucinations, especially the former, have long been practised in many countries as modes of divination, various objects being used, e.g. a drop of ink in the palm of the hand, or a polished finger-nail. The object now most commonly used is a polished sphere of clear glass or crystal (see Crystal-gazing). Hence such hallucinations go by the name of “crystal visions.” The crystal vision often appears as a picture of some distant or unknown scene lying, as it were, in the crystal; and in the picture figures may come and go, and move to and fro, in a perfectly natural manner. In other cases, written or printed words or whole sentences appear. The percipient, see or hear, commonly seems to be in a fully waking state as he observes the objects thus presented. He is usually able to describe and discuss the appearances, successively discriminating details by attentive observation, just as when observing an objective scene; and he usually has no power of controlling them, and no sense of having produced them by his own activity. In some cases these visions have brought back to the mind of the scryer facts or incidents which he could not voluntarily recollect. In other cases, the visions are asserted by credible witnesses to have given to the scryer information, not of his own knowledge, and not of that had not come to his knowledge by normal means. These cases have been claimed as evidence of telepathic communication or even of clairvoyance. But at present the number of well-attested cases of this sort is too small to justify acceptance of this conclusion by those who have only secondhand knowledge of them.

c. Prolonged deprivation of food predisposes to hallucinations, and it would seem that, under this condition, a large proportion of other than healthy persons become liable to them, especially to auditory hallucinations.

d. Certain drugs, notably opium, Indian hemp, and mescal predispose to hallucinations, each tending to produce a peculiar type. Thus Indian hemp and mescal, especially the latter, produce in many cases visual hallucinations in the form of a brilliant play of colours, sometimes a mere succession of patches of brilliant colour, sometimes in architectural or other definite spatial arrangement.

e. The states of transition from sleep to waking, and from waking to sleep, seem to be peculiarly favourable to the appearance of hallucinations. These recurrent sensations mentioned above are especially prone to appear at such times, and a considerable proportion of the sporadic hallucinations of persons in good health are reported to have been experienced under these conditions. The name “hypnagogic” hallucinations, first applied by Alfred Maury, is commonly given to those experienced in these transition states.

f. The presentations, predominantly visual, that constitute the principal content of most dreams, are generally described as hallucinatory, but the propriety of so classing them is very questionable. The present writer is confident that his own dream-presentations lack the sensory vividness which is the essential mark of the percept, whether normal or hallucinatory, and which is the principal, though not the only, character in which it differs from the representation or memory-image. It is true that the dream-presentation, like the percept, differs from the representative imagery of waking life in that it is relatively independent of the representative of volitional control, and to the fact that during sleep the representative imagery appears without that rich setting of undiscriminated or marginal sensation which always accompanies waking imagery, and which by contrast accentuates for introspective reflection the lack of sensory vividness of such imagery.

g. Many of the subjects who pass into the deeper stages of hypnosis (see Hypnotism) show themselves, while in that condition, extremely liable to hallucination, perceiving whatever object is suggested to them as present, and failing to perceive...
any object of which it is asserted by the operator that it is no longer present. The reality of these positive and negative hallucinations of the hypnotized subject has been recently questioned; it being maintained that the subject merely gives verbal assent to the suggestions of the operator. But that the hypnotized subject does really experience hallucinations seems to be proved by the cases in which it is possible to make the hallucination, positive or negative, persist for some time after the termination of hypnosis, and by the fact that in some of these cases the subject, who in the post-hypnotic state seems in every other respect normal and wide awake, may find it difficult to distinguish between the hallucinatory and real objects. Further proof is afforded by experiments such as those by which Alfred Binet showed that a visual hallucination may behave for its percipient in many respects like a real object, e.g. that it may appear reflected in a mirror, displaced by a prism and coloured when a coloured glass is placed before the patient's eyes. It was by means of experiments of this kind that Binet showed that hypnotic hallucinations may approximate to the type of the illusion, i.e. that some real object affecting the sense-organ (in the case of a visual hallucination some detail of the surface upon which it is projected) may provide a nucleus of peripherally excited sensation around which the false percept is built up. An object playing a part of this sort in the genesis of an hallucination is known as a "point de repère." It has been maintained that all hallucinations involve some such point de repère or objective nucleus; but there are good reasons for rejecting this view.

b. In states of ecstasy, or intense emotional concentration of attention upon some one ideal object, the object contemplated seems at times to take on sensory vividness, and so to acquire the character of an hallucination. In these cases the state of mind of the subject is probably similar in many respects to that of the deeply hypnotized subject, and these two classes of hallucination may be regarded as very closely allied.

III. Hallucinations which occur as symptoms of both bodily and mental diseases.

a. Dr H. Head has the credit of having shown for the first time, in the year 1901, that many patients, suffering from more or less painful visceral diseases, disorders of heart, lungs, abdominal viscera, &c., are liable to experience hallucinations of a peculiar kind. These "visceral" hallucinations, which are constantly accompanied by headache of the reflected visceral type, are most commonly visual, more rarely auditory. In all Dr Head's cases the visual hallucination took the form of a shrouded human figure, colourless and vague, often incomplete, generally seen by the patient standing by his bed when he wakes in a dimly lit room. The auditory "visceral" hallucination was in no instance vocal, but took such forms as sounds of tapping, scratching or rumbling, and were heard only in the absence of objective noises. In a few cases the "visceral" hallucination was bisensory, i.e. both auditory and visual.

In all these respects the "visceral" hallucination differs markedly from the commoner types of the sporadic hallucination of healthy persons.

b. Hallucinations are constant symptoms of certain general disorders in which the nervous system is involved, notably of the delirium tremens, which results from chronic alcohol poisoning, and of the delirium of the acute specific fevers. The hallucinations of these states are generally of a distressing or even terrifying character. Especially is this the rule with those of delirium tremens, and in the hallucinations of this disease certain kinds of objects, e.g. rats and snakes, occur with curious frequency.

c. Hallucinations occasionally occur as symptoms of certain nervous diseases that are not usually classed with the insanities, notably in cases of epilepsy and severe forms of hysteria. In the former disorder, the sensory aura that so often precedes the epileptic convulsion may take the form of an hallucinatory object, which in some cases is very constant in character. Unilateral hallucinations, an especially interesting class, occur in severe cases of hysteria, and are usually accompanied by hemi-anæsthesia of the body on the side on which the hallucinatory object is perceived.

d. Hallucinations occur in a large, but not accurately definable, proportion of all cases of mental disease proper. Two classes are recognized: (1) those that are intimately connected with the dominant emotional state or with some dominant delusion; (2) those that occur sporadically and have no such obvious relation to the other symptoms of disease. Hallucinations of the former class tend to accentuate, and in turn to be confirmed by, the congruent emotional or delusional state; but whether these should be regarded as primary symptoms and as the cause of the hallucinations, or vice versa, is generally impossible to say. Patients who suffer delusions of persecution are very apt to develop later in the course of their disease hallucinations of the voices of their persecutors; while in other cases hallucinatory voices, which are at first recognized as such, come to be regarded as real and in these cases seem to be factors of primary importance in the genesis of further delusions. Hallucinations occur in almost every variety of mental disease, but are commonest in the forms characterized by a cloudy dream-like condition of consciousness, and they are more frequent in cases of this sort than in the delirium of chronic alcohol-poisoning, and seem to move waking through a world consisting largely of the images of his own creation, set upon a background of real objects.

In some cases hallucinations are frequently experienced for long periods in the absence of any other symptom of mental disorder, but these no doubt usually imply some morbid condition of the brain.

Physiology of Hallucination.—There has been much discussion as to the nature of the neural process in hallucination. It is generally and rightly assumed that the hallucinatory perception of any object has for its immediate neural correlate a state of excitement which, as regards its characters and its distribution in the elements of the brain, is entirely similar to the neural correlate of the normal perception of the same object. The hallucination is a perception, though a false perception. In the perception of an object and in the representation of it, introspective analysis discovers a number of representative elements. In the case of the representation these elements are sensory images only (except perhaps in so far as actual kinesthetic sensations enter into its composition); whereas, in the case of the percept, some of these elements are sensations, sensations which differ from images in having the attribute of sensory vividness; and the sensory vividness of these elements leads to the whole complex the sensory vividness or reality, the possession of which character by the percept constitutes its principal difference from the representation. Normally, sensory vividness attaches only to those representative elements which are excited through stimulations of the sense-organs. The normal percept, then, owes its character of sensory reality to the fact that a certain number of its presentative elements are sensations peripherally excited by impressions made upon a sense-organ. The problem is, then, to account for the fact that the hallucination contains presentative elements that have sensory vividness, that are sensations, although they are not excited by impressions from the external world falling upon a sense-organ. Most of the discussions of this subject suffer from the neglect of this preliminary definition of the problem. Many authors, notably W. Wundt and his disciples, have been content to assume that the sensation differs from the memory-image only in having a higher degree of intensity; from which they infer that its neural correlate in the brain cortex also differs from that of the image only in having a higher degree of intensity. For them an hallucination is therefore merely a representation whose neural correlate involves an intensity of excitement of certain brain-elements such as is normally produced only by peripheral stimulation of sensory nerves in the sense-organs. But this view, so attractively simple, ignores an insuperable objection. Sensory vividness is not to be identified with superior intensity; for while the least intense sensation has it, the memory image of the most intense sensation lacks it completely.
And, since intensity of sensation is a function of the intensity of the underlying neural excitement, we may not assume that sensory vividness is also the expression in consciousness of that intensity of excitement. If Wundt's view were true a progressive diminution of the intensity of a sensory stimulus should bring the sensation to a point in the scale of diminishing intensity at which it ceases to be sensation, ceases to have sensory vividness and becomes an image merely. But this is not the case; with diminishing intensity of stimulation, the sensation declines to a minimal intensity and then disappears from consciousness. This objection applies not only to Wundt's view of hallucinations, but also to H. Taine's explanation of them by the aid of his doctrine of "reductives," for this too identifies sensory vividness with intensity. (H. Taine, De l'intelligence, tome i. p. 108.)

Another widely current explanation is based on the view that the representation and the percept have their anatomical bases in different element-groups or "centres" of the brain, the "centre" of the representation being assigned to a higher level of the brain than that of the percept (the latter being sometimes assigned to the basal ganglia of the brain, the former to the cortex). It is then assumed that while the lower perceptual centre is normally excited only through the sense-organ, it may occasionally be excited by impulses playing down upon it from the corresponding centre of representation, when hallucination results.

This view also is far from satisfactory, because the great additions recently made to our knowledge of the brain tend very strongly to show that both sensations and memory-images have their anatomical bases in the same sensory areas of the cerebral cortex; and many considerations converge to show that their anatomical bases must be, in part at least, identical.

The views based on the assumptions of complete identity, and of complete separateness, of the anatomical bases of the percept and of the representation are then alike untenable; and the alternative—that their anatomical bases are in part identical, in part different, which is indicated by this conclusion—renders possible a far more satisfactory doctrine. We have good reason to believe that the neural correlate of sensation is the transmission of the nervous impulse through a sensori-motor arc of the cortex, made up of a chain of neurons; and the view suggests itself that the neural correlate of the corresponding memory-image is the transmission of the impulse through a part only of this chain of cortical elements, either the efferent motor part of this chain or the afferent sensory part of it. Professor W. James's theory of hallucinations is based on the latter assumption. He suggests that the sensory vividness of sensation and of the percept is due to the discharge of the excitement of the chain of elements in the forward or motor direction; and that, in the case of the image and of the representation, the discharge takes place, not in this direction through the efferent channel of the centre, but laterally into other centres of the cortex. Hallucination may then be conceived as caused by obstruction, or abnormally increased resistance, of the paths connecting such a cortical centre with others, so that, when it becomes excited in any way, the tension or potential of its charge rises, until discharge takes place in the motor direction through the efferent limbs of the sensori-motor arcs which constitute the centre.

It is a serious objection to this view that, as James himself, in common with most modern authors, maintains, every idea has its motor tendency which commonly, perhaps always, finds expression in some chain of tension of muscles, and in many cases issues in actual movements. Now if we accept James's theory of hallucination, we should expect to find that whenever a representation issues in bodily action it should assume the sensory vividness of an hallucination; and this, of course, is not the case.

The alternative form of the view that assumes partial identity of the anatomical bases of the percept and the representation of an object, would regard the neural correlate of the sensation as the transmission of the nervous impulse throughout the length of the sensori-motor arc of the cortex, from sensory inlet to motor outlet; and that of the image as its transmission through the efferent part of this arc only; that is to say, in the case of the image, it would regard the excitement of the arc as being initiated at some point between its afferent inlet and its motor outlet, and as spreading, in accordance with the law of forward conduction, towards the motor outlet only, so that only the part of the arc distal or efferent to this point becomes excited. This view of the neural basis of sensory vividness, which correlates the difference between the sensation and the image with the only known difference between their physiological conditions, namely the peripheral initiation of the one and the central initiation of the other, enables us to formulate a satisfactory theory of the physiology of hallucinations.

The anatomical basis of the perception and of the representation of any object is a functional system of nervous elements, comprising a number of sensori-motor arcs, whose excitement by impulses ascending to them by the sensory paths from the sense-organs determines sensations, and whose excitement in their efferent parts only determines the corresponding images. In the case of perception, some of these arcs are excited by impulses ascending from the sense-organs, others only by the spread of normal or abnormal stimuli from one part of the system to another; while, in the case of the representation, all alike are excited by impulses that reach the system from other parts of the cortex and spread throughout its efferent parts only to its motor outlets.

If then impulses enter this system by any of the afferent limbs of its sensori-motor arcs, the presentation that accompanies its excitement will have sensory vividness and will be a true perception, an illusion, or an hallucination, according as these impulses have followed the normal course from the sense-organ, or have been diverted, to a lesser or greater degree, from their normal paths. If any such neural system becomes abnormally excitable, or becomes excited in any way with abnormal intensity, it is thereby rendered a path of exceptionally low-resistance capable of diverting to itself, from their normal path, any streams of impulses ascending from the sense-organ; which ascending impulses, entering the system by its afferent inlets, excite sensations that impart to the presentation the character of sensory vividness; the presentation thus acquires the character of a percept in spite of the absence of the appropriate impressed on the sense-organ, and we call it an hallucination.

This view renders intelligible the modus operandi of many of the predisposing causes of hallucination; e.g. the pre-occupation with certain representations of the ecstatic, or of the sufferer from delusions of persecution; the intense expectation of a particular sense impression, the generally increased excitability of the cortex in states of delirium; in all these conditions the abnormally intense excitement of the cortical systems may be supposed to give them an undue directive and attractive influence upon the streams of impulses ascending from the sense-organs, so that sensory impulses may be diverted from their normal paths. Again, it renders intelligible the part played by chronic irritation of a sense-organ, as when chronic irritation of the internal ear leads on to hallucinations of hearing; perhaps also the chronic irritation of sensory nerves that must accompany the states of visceral disease, shown by Head to be so frequently accompanied by a liability to hallucinations; for any such chronic irritation supplies a stream of disorderly impulses rising constantly from the sense-organ, for the reception of which the brain has no appropriate system, and which, therefore, readily enters any organised cortical system that at any moment constitutes a path of low-resistance; and which, by the influence of fixed gazing upon a crystal, or the placing of a shell over the ear, in inducing visual and auditory hallucinations. The "recurrent sensations" experienced after prolonged occupation with some one kind of sensory object may be regarded as due to an abnormal excitability of the cortical system concerned, resulting from its unduly prolonged exercise. The hypothesis renders intelligible also the liability to hallucination of persons in the hysterical and hypnotic states, in whose brains
The question formulated above thus resolved itself for Gurney into the more definite form, "Can we find any good reason for believing that coincidental hallucinations are sometimes veridical, that the state of mind of a person at some great crisis of his experience may telepathically induce in the mind of some distant relative or friend an hallucinatory perception of himself?"

It was at once obvious that, if coincidental apparitions can be proved to occur, this question can only be answered by a statistical inquiry; for each such coincidental hallucination, considered alone, may always be regarded as most educated persons of the present time have regarded them, namely, as purely coincidental coincidences. That the coincidences are not merely accidental can only be proved by showing that they occur more frequently than the doctrine of chances would justify us in expecting. Now, the death of any person is a unique event, and the probability of its occurrence upon any particular day may be very simply calculated from the mortality statistics, if we assume that nothing is known of the individual's vitality. On the other hand, hallucinatory perceptions of persons, occurring to sane and healthy individuals in the fully waking state, are comparatively rare occurrences, whose frequency we may hope to determine by careful inquiry among many persons. Of course, if other figures expressing the frequency of such hallucinations, we can deduce, by the help of the laws of chance, the proportion of such hallucinations that may be expected to coincide with (or, for the purposes of the inquiry, to fall within twelve hours of) the death of the person whose apparition appears, if no causal relation obtains between the coinciding events. If, then, it appears that the proportion of such coincidental hallucinations is greater than the laws of probability will account for, a certain presumption of a causal relation between the coinciding events is thereby established; and the greater the excess of such coincidences, the stronger does this presumption become.

Gurney attempted a census of hallucinations in order to obtain data for this statistical treatment, and the results of it, embodied in Phantoms of the Living, were considered by the authors of that work to justify the belief that some coincidental hallucinations are veridical. In the year 1889 the Society for Psychical Research appointed a committee, under the chairmanship of the late Henry Sidgwick, to make a second census of hallucinations on a more extensive and systematic plan than the first, in order that the important conclusion reached by the authors of Phantoms of the Living might be put to the severest test rendered possible by a larger and more carefully collected mass of data. Seventeen thousand adults returned answers to the question, "Have you ever, when believing yourself to be completely awake, had a vivid impression of seeing or being touched by a living being or inanimate object, or of hearing a voice; which impression, so far as you could discover, was not due to any external physical cause?" Rather more than two thousand persons answered affirmatively, and to each of these were added careful inquiries concerning their hallucinatory experiences. In this way it was found that of the total number, 382 apparitions of persons living at the moment (or not more than twelve hours dead) had been recognized by the percipients, and that, of these, 80 were alleged to have been experienced within twelve hours of the death of the person whose apparition had appeared. A careful review of all the facts, conditions and probabilities, led the committee to estimate that the former number should be enlarged to 1300 in order to make ample allowance for forgetfulness and for all other causes that might have tended to prevent the registration of apparitions of this class. On the other hand, a severe criticism of the alleged death-coincidences led them to reduce the number, admitted by them for the purposes of their calculation, to 30. The making of these adjustments gives us about 1 in 43 as the proportion of coincidental death-apparitions to the total number of recognized apparitions among the 17,000 persons reached by the census. Now the death-rate being just over 19 per thousand, the probability that any person taken at random will die on a given day is about 1 in 19,000; or, more strictly speaking, the average probability that any person will die within any given period of twenty-four hours duration.
is about 1 in 19,000. Hence the probability that any other particular event, having no causal relation to his death, but occurring during his lifetime (or not later than twelve hours after his death) will fall within the same twenty-four hours as his death is 1 in 19,000; i.e. if an apparition of any individual is seen and recognized by any other person, the probability of its being experienced within twelve hours of that individual's death is 1 in 19,000, if no causal relation obtains between the two events. Therefore, of all recognized apparitions of living persons, 1 only in 10,000 may be expected to be a death-coincidence of this sort. But the census shows that of 135 recognized apparitions of living persons 30 are death-coincidences and that is equivalent to 440 in 19,000. Hence, of recognized hallucinations, those coinciding with death are 440 times more numerous than we should expect, if no causal relation obtained; therefore, if neither the data nor the reasoning can be destructively criticized, we are compelled to believe that some causal relation obtains; and, since good evidence of telepathic communication has been experimentally obtained, the least improbable explanation of these death-apparitions is that the dying person exerts upon his distant friend some telepathic influence which generates an hallucination of himself.

These death-coincidences constitute the main feature of the argument in favour of telepathic communication between distant persons, but the census of hallucinations afforded other data from which a variety of arguments, tending to support this conclusion, were drawn by the committee; of these the most important are the cases in which the hallucinatory perception embodied details that were connected with the person perceived and which could not have become known to the percipient by any normal means. The committee could not find in the results of the census any evidence sufficient to justify a belief that hallucinations may be due to telepathic influence exerted by personalities surviving the death of the body.

The critical handling of the cases by the committee seems to be above reproach. Those who do not accept their conclusion based on the death-coincidences must direct their criticism to the question of the reliability of the reports of these cases. It is to be noted that, although only those cases are reckoned in which the percipient had no cause to expect the death of the person whose apparition he experienced, and although, in nearly all the accepted cases, some record or communication of the hallucination was made before hearing of the death, yet in very few cases was any contemporary written record of the event forthcoming for the inspection of the committee. (W. McD.)

HALLUIN—HALMAHERA

HALLUIN, a frontier town of northern France, in the department of Nord, near the right bank of the Lys, 14 m. N. by E. of Lille by rail. Pop. (1906) town, 11,670; commune, 16,158. Its church is of Gothic architecture. The manufactures comprise linen and cotton goods, chairs and rubber goods, and brewing and tanning are carried on; there is a board of trade arbitration. The family of Halluin is mentioned as early as the 13th century. In 1587 the title of duke and peer of the realm was granted to it, but in the succeeding century it became extinct.

HALM, CARL FELIX (1809-1882), German classical scholar and critic, was born at Munich on the 5th of April 1809. In 1849, after having held appointments at Spire and Hradamar, he became rector of the newly founded Maximiliansgymnasium at Munich, and in 1856 director of the royal library and professor in the university. These posts he held till his death on the 5th of October 1882. It is chiefly as the editor of Cicero and other Latin authors that Halm is known, although in early years he also devoted considerable attention to Greek. After the death of J. C. Orelli, he joined J. G. Baier in the preparation of a revised critical edition of the rhetorical and philosophical writings of Cicero (1854-1862). His school editions of some of the speeches of Cicero in the Haupt and Sauppe series, with notes and introductions, were very successful. He also edited a number of classical texts for the Teubner series, the most important of which are Tacitus (4th ed., 1883); Rhetores Latinini minores (1863); Quintilian (1868); Sulpicius Severus (1866); Minucius Felix together with Firmicus Maternus De errore (1867); Salvianus (1877) and Victor Vitensis's Historia persecutionis Africanae provinciae (1878). He was also an enthusiastic collector of autographs.

See articles by W. Christ and G. Laboumann in Allgemeine deutsche Biographie and by C. Bursian in Biographisches Jahrbuch; and J. E. Sundy, Hist. of Classical Scholarship, iii. 195 (1908).

HALMA [Greek for "jump"], a table game, a form of which was known to the ancient Greeks, played on a board divided into squares, resembling chess pawns. In the two-handed game 19 men are employed on each side, coloured respectively black and white; in the four-handed each player has 13, the men being coloured white, black, red and green. At the beginning of the game the men are drawn up in triangular formation in the enclosures, or yards, diagonally opposite each other in the corners of the board. The object of each player is to get all his men into his enemy's yard, the player winning who first accomplishes this. The moves are made alternately, the mode of progression being by a step, from one square to another immediately adjacent, or by a jump (whence the name), which is the jumping of a man from a square in front of it into an empty square on the other side of it. This corresponds to jumping in draughts, except that, in halma, the hop may be in any direction, more friendly as well as hostile men, and the men jumped over are not taken but remain on the board.

In the four-handed game either each player plays for himself, or two adjacent players play against the other two.

See Card and Table Games, by Professor Hoffmann (London, 1893).

HALMAHERA ["great land"; also Jilolo or Gilolo], an island of the Dutch East Indies, belonging to the residency of Ternate, lying under the equator and about 125° E. Its shape is extremely irregular, resembling that of the island of Celebes. It consists of four peninsulas so arranged as to enclose three great bays (Kayu, Bicholi, Weda), all opening towards the east, the northern peninsula being connected with the others by an isthmus only 5 m. wide. On the western side of the isthmus lies another bay, that of Dodinga, in the mouth of which are situated the two islands Ternate and Tidore, whose political importance exceeds that of the larger island (see these articles). Of the four peninsulas of Halmahera the northern and the southern are reckoned to the sultanate of Ternate, the north-eastern and south-eastern to that of Tidore; the former having eleven, the latter three districts. The distance between the extremities of the northern and southern peninsulas, measured along the curve of the west coast, is about 240 m.; and the total area of the island is 6700 sq. m. Knowledge of the island is very incomplete. It appears that the four peninsulas are traversed in the direction of their longitudinal axis by mountain chains 3000 to 4000 ft. high, covered with forest, without a central chain at the nucleus of the island whence the peninsulas diverge. The mountain chains are frequently interrupted by plains, as those of Weda and Kohi. The northern part of the mountain chain of the northern peninsula is volcanic, its volcanoes continue the line of those of Makian, Ternate and Tidore. Coral formations on heights in the interior would indicate oscillations of the land in several periods, but a detailed geology of the island is wanting. To the north-east of the northern peninsula is the considerable island of Morotai (635 sq. m.), and to the west of the southern peninsula the more important island of Bachian (q.v.) among others. Galeda is a considerable settlement, situated a little to the south of the summit of Sumbawa, in a well cultivated plain which extends southward and inland. Vegetation is prolific. Rice is grown by the natives, but the sago tree is of far greater importance to them. Dammar and coco-nuts are also grown. The sea yields trepang and pearl shells. A little trade is carried on by the Chinese and Macassars of Ternate, who, crossing the narrow isthmus of Dodonga, enter the bay of Kayu on the east coast. The total population is estimated at 100,000.

The inhabitants are mostly of immigrant Malay stock. In the northern peninsula are found people of Papuan type, probably representing the aborigines, and a tribe around Galea,
who are Polynesian in physique, possibly remnants, much mixed by subsequent crossings with the Papuan indigenes, of the Caucasian hordes emigrating in prehistoric times across the Pacific. M. Achille Rayfay gives a description of them in *Tour du monde* (1879) where photographs will be found. "They are as unlike the Malays as we are, excelling them in tallness of stature and elegance of shape, and being perfectly distinguished by their generally lighter and brighter brown skin, delicate nose and their horizontally placed eyes. Their beards are sometimes thick; their lips are muscular; the colour of their skins is cinnamon brown. Spears of iron-wood, abundantly barbed, and small bows and bamboo arrows free from poison are their principal weapons." They are further described as having temples (sabuas) in which they suspend images of serpents and other monsters as well as the trophies procured by war. They believe in a better life hereafter, but have no idea of a hell or a devil, their evil spirits only tormenting them in the present state.

The Portuguese and Spaniards were better acquainted with Halmahera than with many other parts of the archipelago; they called it sometimes Batu China and sometimes Moro. It was circumnavigated by one of their vessels in 1525, and the general outline of the coasts is correctly given in their maps at a time when separate portions of Celebes, such as Macassar and Menado, are represented as distinct islands. The name (Jilolo) was really that of a native state, the sultan of which had the chief rank among the princes of the Moluccas before he was supreme over the whole of Celebes. His capital, Jilolo, lay on the west coast on the first bay to the north of that of Dodinga. In 1876 Danu Hassan, a descendant of the sultans of Jilolo, raised an insurrection in the island for the purpose of throwing off the authority of the sultans of Tidore and Ternate; and his efforts would probably have been successful but for the intervention of the Dutch. In 1878 a Dutch expedition was directed against the pirates of Tobalali, and they were virtually extirpated. Slavery remains in the interior. Missionary work, carried on in the northern peninsula of Halmahera since 1866, has been fairly successful among the heathen natives, but less so among the Mahommadesans, who have often incited the others against the missionaries and their converts.

HALMSTAD, a seaport of Sweden, chief town of the district (län) of Halland, on the E. shore of the Cattegat, 76 m. S.S.E. of Gothenburg by the railway to Helsingborg. Pop. (1900), 15,362. It lies at the mouth of the river Nissa, having an inner harbour (15 ft. depth), an outer harbour, and roads giving anchorage (24 to 36 ft.) exposed to S. and N.W. winds. In the neighbourhood there are quarries of granite, which is exported chiefly to Germany. Other industries are engineering, shipbuilding, jute, and there are woolen and paper factories. The principal exports are granite, timber and hats; and butter through Helsingborg and Gothenburg. The imports are coal, machinery and grain. Potatoes are largely grown in the district, and the salmon fisheries are valuable. The castle is the residence of the governor of the province. There are both mineral and sea-water baths in the neighbourhood.

Mention of the church of Halmstad occurs as early as 1462, and the fortifications are mentioned first in 1225. The latter were demolished in 1734. There were formerly Dominican and Franciscan monasteries in the town. The oldest town-privileges date from 1367. During the revolt of the miner Engelbrekt, it twice fell into the hands of the rebels—in 1434 and 1436. The town appears to have been frequently chosen as the meeting-place of the rulers and delegates of the three northern kingdoms; and under the union of Kalmar it was appointed to be the place for the election of a new Scandinavian monarch whenever necessary. The län of Halland formed part of the territory of Denmark in Sweden, and accordingly, in 1534, during his war with the Danes, Gustavus Vasa assaulted and took its chief town. In 1660, by the treaty of Copenhagen, the whole district was ceded to Sweden. In 1676 Charles XII. defeated near Halmstad a Danish army which was attempting to retake the district, and since that time Halland has formed part of Sweden.

HALO, a word derived from the Gr. ἀλώς, a threshold-floor, and afterwards applied to denote the disk of the sun or moon, probably on account of the circular path traced out by the oxen threshing the corn. It was thence applied to denote any luminous ring, such as that viewed around the sun or moon, or portrayed about the heads of saints.

In physical science, a halo is a luminous circle, surrounding the sun or moon, with various auxiliary phenomena, and formed by the reflection and refraction of light by ice-crystals suspended in the atmosphere. The optical phenomena produced by atmospheric water and ice may be divided into two classes, according to the relative position of the luminous ring and the source of light. In the first class we have halos, and coronae, or "glories," which encircle the luminary; the second class includes rainbows, fog-bows, mist-halos, anhelia and mountainspectres, whose centres are at the anti-solar point. Here it is only necessary to distinguish halos from coronae. Halos are at definite distances (22° and 46°) from the sun, and are coloured red on the inside, being due to refraction; coronae closely surround the sun at variable distances, and are coloured red on the outside, being due to diffraction.

The phenomenon of a solar (or lunar) halo as seen from the earth is represented in fig. 1; fig. 2 is a diagrammatic sketch showing the appearance as viewed from the zenith; but it is only in exceptional circumstances that all the parts are seen. Encircling the sun or moon (S), there are two circles, known as the inner halo I, and the outer halo O, having radii of about 22° and 46°, and exhibiting the colours of the spectrum in a confused manner, the only decided tint being the red on the inside. Passing through the luminary and parallel to the horizon, there is a white luminous circle, the parhelic circle (P), on which a number of images of the luminary appear. The most brilliant are situated at the intersections of the inner halo and the parhelic circle; these are known as parhelia (denoted by the letter p in the figures) (from the Gr. παρήλια, beside, and ἀλώς, the sun) or "mock-suns," in the case of the sun, and as paraselene (from παρά and σελήνη, the moon) or "mock-moons," in the case of the moon. Less brilliant are the parhelia of the outer halo. The parhelia are most brilliant when the sun is near the horizon. As the sun rises, they pass a little beyond the halo and exhibit flaming tails. The other images on the parhelic circle are the parhelic (q), and the anhelion (c) (from the Greek ἀνθελία, opposite, and ἀλώς, the sun). The former are situated at from 90° to 140° from the sun; the latter is a white patch of light situated at the anti-solar point and often exceeding in size the apparent diameter of the luminary. A vertical circle passing through the sun may also be seen. From the parhelia of the inner halo two oblique curves (L) proceed. These are known as the "arcs of Lowitz," having been first described in 1794 by Johann Tobias Lowitz (1757–1804). Luminous arcs (T), tangential to the upper and lower parts of each halo, also occur, and in the case of the inner halo, the arcs may be prolonged to form a quasi-elliptic halo.

The physical explanation of halos originated with René Descartes, who ascribed their formation to the presence of ice-crystals in the atmosphere. This theory was adopted by Edmé Mariotte, Sir Isaac Newton and Thomas Young; and, although
certain of their assumptions were somewhat arbitrary, yet the general validity of the theory has been demonstrated by the researches of J. G. Galle and A. Bravais. The memoir of the last-named, published in the *Journal de l'École royale polytechnique* for 1847 (xviii., 1-270), ranks as a classic on the subject; it is replete with examples and illustrations, and discusses the various phenomena in minute detail.

The usual form of ice-crystals in clouds is a right hexagonal prism, which may be elongated as a needle or foreshortened like a thin plate. There are the refracting angles possible, one of 120° between two adjacent prism faces, one of 60° between two alternate prism faces, and one of 90° between a prism face and the base. If innumerable numbers of such crystals fall in any manner between the observer and the sun, light falling upon these crystals will be refracted, and the refracted rays will be crowded together in the position of minimum deviation (see *Refraction of Light*). Mariotte explained the inner halo as being due to refraction through a pair of alternate faces, since the minimum deviation of an ice-prism whose refracting angle is 60° is about 22°. Since the ray passing through the least for the least refrangible rays, it follows that the red rays will be the least refracted, and the violet the more refracted, and therefore the halo will be coloured red on the inside. Similarly, as explained by Henry Cavendish, the halo of 46° is due to refraction by faces inclined at 90°. The impurity of the colours (due partly to the sun's diameter, but still more to oblique refraction) is more marked in haloes than in rainbows; in fact, only the red is at all pure, and as a rule, only a mere trace of green or blue is seen, the external portion of each halo being nearly white.

The explanation is on one phenomenon which admit of explanation without assigning any particular distribution to the ice-crystals. But it is obvious that certain distributions will predominate, for the crystals will tend to fall so as to offer the least resistance to their motion; a needle-shaped crystal tending to keep its axis vertical, a plate-shaped crystal to keep its axis horizontal. Thomas Young explained the parhelic circle (P) as due to refraction from the vertical faces of the long prisms and the bases of the short ones. If these vertical faces become very numerous, the eye will perceive a colourless horizontal circle. Reflection from an excess of horizontal prisms gives rise to a vertical circle, while the rest of the halo shows a triangular form.

The parhelia (p) were explained by Mariotte as due to refraction through a pair of alternate faces of a vertical prism. When the sun is near the horizon the rays fall upon the principal section of the prisms; the minimum deviation for such rays is 22°, and consequently the parhelia are not only on the inner halo, but also on the parhelic circle. As the sun rises, the rays enter the prisms more and more obliquely, and the angle of minimum deviation increases; but since the emergent ray makes the same angle with the refracting edge as the incident ray, it follows that the parhelia will remain on the parhelic circle, while receding from the inner halo. The various faces of the angle of minimum deviation for rays of different refrangibilities give rise to spectral colours, the red being nearest the sun, while farther away the overlapping of the spectra forms a flaming colourless tail sometimes extending over as much as 10° to 20°. The arcs of Lowitz (L) are probably due to small oscillations of the vertical prisms.

The "tangential arcs" (T) were explained by Young as being caused by the thin plates with their axes horizontal, refraction taking place through alternate faces. The axes will take up any position, and consequently give rise to a continuous series of parhelia which touch externally the inner halo, both above and below, and under certain conditions (such as the requisite altitude of the sun) form two closed elliptical curves; generally, however, only the upper and lower portions are seen. Similarly, the tangential arcs to the halo of 46° are due to refraction through faces inclined at 90°.

The paranethia (q) may be due to two internal or two external reflections. A pair of triangular prisms having a common face, or a stellar ice crystal formed by the symmetrical interpenetration of two triangular prisms admits of two internal reflections by faces inclined at 120°, and so give rise to two colourless images each at an angular distance of 120° from the sun. Double internal reflection by a triangular prism would form a single coloured image on the parhelic circle at about 90° from the sun. These angular distances are attained only when the sun is on the horizon, and they increase as it rises.

The anhelion (a) may be explained as caused by two internal reflections of the solar rays by a hexagonal lamellar crystal, having its axis horizontal and one of the diagonals of its base vertical. The emerging rays are parallel to their original direction and form a colourless image on the parhelic circle opposite the sun.

**References.**—Auguste Bravais's celebrated memoir, "Sur les halos et les phénomènes optiques qui les accompagnent" (*Journ. Éc decree du temps. The term is applied to the four compounds of hydrogen, chlorine, and iodine, on account of the great similarity of their sodium salts. These compounds are:

- Chlorine
- Bromine
- Iodine
- Fluorine

These four elements show a great resemblance to one another in their general chemical behaviour, and in that of their compounds, whilst their physical properties show a gradual transition. Thus, as the atomic weight increases, the state of aggregation changes from that of a gas in the case of chlorine and bromine, to that of a liquid (bromine) and finally to that of the solid (iodine); at the same time the melting and boiling points rise with increasing atomic weights. The halogen of lower atomic weight can dispel a film of higher atomic weight from its hydrogen compound, or from the salt derived from such hydrogen compound, while, on the other hand, the halogen of higher atomic weight can displace that of lower atomic weight, from the halogen oxo-acids and their salts; thus iodine will liberate chlorine from potassium chloride and also from perchloric acid. All four of the halogens unite with hydrogen, but the affinity for hydrogen decreases as the atomic weight increases, hydrogen and fluorine uniting explosively at very low temperatures and in the dark, whilst hydrogen and iodine unite only at high temperatures, and even then the resulting compound is very readily decomposed by heat.

The hydrides of the halogens are all colourless, strongly fuming gases, readily soluble in water and possessing a strong acid reaction; they react readily with basic oxides, forming in most cases well defined crystalline salts which resemble one another very strongly. On the other hand the stability of the known oxygen compounds increases with the atomic weight, thus iodine pentoxide is, at ordinary temperatures, a well-defined crystalline solid, which is only decomposed on heating strongly, whilst chlorine monoxide, chlorine peroxide, and chlorine heptoxide are very unstable, even at ordinary temperatures, decomposing at the slightest shock. Compounds of fluorine and oxygen, and of bromine and oxygen, have not yet been isolated. In some respects there is a very marked difference between fluorine and the other members of the group, for, whilst sodium chloride, bromide and iodide are readily soluble in water, sodium fluoride is much less soluble; again, silver chloride, bromide and iodide are practically insoluble in water, whilst, on the other hand, silver fluoride is appreciably soluble in water. Again, fluorine shows a great tendency to form double salts, which have no counterpart among the compounds formed by the other members of the family.

**HALOS, FRANS** (1582?-1666), Dutch painter, was born at Antwerp according to the most recent authorities in 1582 or 1583, and died at Haarlem in 1666. As a portrait painter second only to Rembrandt in Holland, he displayed extraordinary talent and quickness in the exercise of his art coupled with improvisation in the use of the means which that art secured to him. At a time when the Dutch nation fought for independence and won it, Halas appears in the ranks of its military gilds. He was also a member of the Chamber of Rhetoric, and (1644) chairman of the Painters' Corporation at Haarlem. But as a man he had failings. He so ill-treated his first wife, Anneke Hermans,
that she died prematurely in 1616; and he barely saved the character of his second, Lyseth Reyniers, by marrying her in 1617. Another defect was partiality to drink, which led him into low company. Still he brought up and supported a family of ten children with success till 1652, when the forced sale of his pictures and furniture, at the suit of a baker to whom he was indebted for bread and money, brought him to absolute penury.

The inventory of the property seized on this occasion only mentions three mattresses and bolsters, an armoire, a table and five pictures. This humble list represents all his worldly possessions at the time of his bankruptcy. Subsequently to this he was reduced to still greater straits, and his rent and firing were paid by the municipality, which afterwards gave him (1664) an annuity of 200 florins. We may admire the spirit which enabled him to produce some of his most striking works in his unhappy circumstances: we find his widow seeking outdoor relief from the guardians of the poor, and dying obscurely in a hospital. Hals's pictures illustrate the various strata of society into which his misfortunes led him. His banquets or meetings of officers, of sharpshooters, and gildsmen are the most interesting of his works. But they are not more characteristic than his low-life pictures of itinerant players and singers. His portraits of gentelfolk are true and noble, but hardly so expressive as those of fishwives and tavern heroes.

His first master at Antwerp was probably van Noort, as has been suggested by M. G. S. Davies, but on his removal to Haarlem Frans Hals entered the atelier of van Mander, the painter and historian, of whom he possessed some pictures which went to pay the debt of the baker already alluded to. But he soon improved upon the practice of the time, illustrated by J. van Schoorel and Antonio Moro, and, emancipating himself gradually from tradition, produced pictures remarkable for truth and dexterity of hand. We prize in Rembrandt the golden glow of effects based upon artificial contrasts of low light and immeasurable distance, in Hals the warmth and glow of daylight. Their works were painters of touch, but of touch on different keys—Rembrandt was the bass, Hals the treble. The latter is perhaps more expressive than the former. He seizes with rare intuition a moment in the life of his sitters. What nature displays in that moment he reproduces thoroughly in a very delicate scale of colour, and with a perfect mastery over every form of expression. He becomes so clever at last that exact tone, light and shade, and modelling are all obtained with a few marked and fluid strokes of the brush.

In every form of art we can distinguish his earlier style from that of later years. It is curious that we have no record of any work produced by him in the first decade of his independent activity, save an engraving by Jan van de Velde after a lost portrait of "The Minister Johannes Bogardus," who died in 1614. The earliest works by Frans Hals that have come down to us, "Two Boys Playing and Singing" in the gallery of Cassel, and a "Banquet of the officers of the St Joris Doele" or Arquebusiers of St George (1616) in the museum of Haarlem, exhibit him as a careful draughtsman capable of great finish, yet spirited withal. His flesh, less clear than it afterwards becomes, is pastose and burnished. Later he becomes more effective, displays more freedom of hand, and a greater command of effect. At this period we note the beautiful full-length of "Madame van Beresteyn" at the Louvre in Paris, and a splendid full-length portrait of "Willem van Hethuysen" leaning on a sword in the Liechtenstein collection at Vienna. Both these pictures are equalled by the other "Banquet of the officers of the Arquebusiers of St George" (with different portraits) and the "Banquet of the Officers of the Cloveniers Doelen" or Arquebusiers of St Andrew of 1627; and an "Assembly of the officers of the Arquebusiers of St Andrew" of 1633 in the Haarlem Museum. A picture of the same kind in the town hall of Amsterdam, with the date of 1637, suggests some study of the masterpieces of Rembrandt, and a similar influence is apparent in a picture of 1641 at Haarlem, representing the "Regents of the Company of St Elizabeth" and in the portrait of "Maria Voogt" at Amsterdam. But Rembrandt's example did not create a lasting impression on Hals. He gradually dropped more and more into grey and silvery harmonies of tone; and two of his canvases, executed in 1664, "The Regents and Regentesses of the Oudemannenhuis" at Haarlem, and the quive of round the lips of the curious but all monochrome. In fact, ever since 1641 Hals had shown an eagerness to restrict the gamut of his palette, and to suggest colour rather than express it. This is particularly noticeable in his flesh tints which from year to year became more grey, until finally the shadows were painted in almost absolute black, as in the "Tymane Oosdorp," of the Berlin Gallery. As this tendency coincides with the period of his poverty, it has been suggested that one of the reasons, if not the only reason, of his predilection for black and white pigment was the cheapness of these colours as compared with the costly lakes and carmines.

As a portrait painter Frans Hals had scarcely the psychological insight of a Rembrandt or Velazquez, though in a few works, like the "Admiral de Ruyter," in Earl Spencer's collection, the "Jacob Olycan," at the Hague Gallery, and the "Albert van der Meer" at Haarlem town hall, he reveals a searching analysis of character which has little in common with the instantaneous expression of his so-called "character" portraits. In these he generally sets upon the canvas the fleeting aspect of the various stages of merriment, from the subtle, half ironic smile of Antwerp days to the curiously misnamed "Laughing Cavalier" in the Wallace Collection to the imbecile grin of the "Hille Bobbe" in the Berlin Museum. To this group of pictures belong Baron Gustav Rothschild's "Jester," the "Bohmienne" at the Louvre, and the "Fisher Boy" at Antwerp, whilst the "Portrait of the Artist with his second Wife" at the Ryks Museum in Amsterdam, and the somewhat confused group of the "Bерестейн Family" at the Louvre show a similar tendency. Far less scattered in arrangement than this Beresteyn group, and in every respect one of the most masterful of day-Hague, or, as it were, "The Painter and his Family" in the possession of Colonel Warde, which was almost unknown until it appeared at the winter exhibition at the Royal Academy in 1906.

Though a visit to Haarlem town hall, which contains the five enormous Doelen groups and the two Regenten pictures, is as necessary for the student of Hals's art as a visit to the Prado in Madrid is for the student of Velazquez, good examples of the Dutch master have found their way into most of the leading public and private collections. In the British Isles, besides that work already mentioned, portraits by Hals are to be found at the National Gallery, the Edinburgh Gallery, the Glasgow Corporation Gallery, Hampton Court, Buckingham Palace, Devonshire House, and the collections of Lord Northbrooke, Lord Ellesmere, Lord Iveagh and Lord Spencer.

At Amsterdam is the celebrated "Flute Player," once in the Dupper collection at Dort; at Brussels, the patrician "Heytuyersen;" at the Louvre, "Descartes;" at Dresden, the painter "Van der Vinne." Hals's sitters were taken from every class of society—admirals, generals and burgomasters pairing with merchants, lawyers, clerks. To register all that we find in public galleries would involve much space. There are eight portraits at Berlin, six at Cassel, five at St Petersburg, six at the Louvre, two at Brussels, five at Dresden, two at Gotha. In private collections, chiefly in Paris, Haarlem and Vienna, we find an equally important number. Amongst the painter's most successful representations of fishwives and termagants we should distinguish the "Hille Bobbe" of the Berlin Museum, and the "Hille Bobbe with her Son" in the Dresden Gallery. Itinerant players are best illustrated in the Neville-Goldsmith collection at the Hague, and the Six collection at Amsterdam. Boys and girls singing, playing or laughing, or men drinking, are to be found in the gallery of Schwerin, in the Arenberg collection, and in the royal palace at Brussels.

For two centuries after his death Frans Hals was held in such poor esteem that some of his paintings, which are now among the proudest possessions of public galleries, were sold at auction.
for a few pounds or even shillings. The portrait of “Johannes Acronius,” now at the Berlin Museum, realized five shillings at the Emschera sale in 1786. The splendid portrait of the man with the sword at the Liechtenstein gallery was sold in 1800 for £4, 5s. With his rehabilitation in public esteem came the enormous rise in values, and, at the Secretan sale in 1889, the portrait of “Pieter van de Broecke d’Anvers” was bid up to £420, while in 1908 the National Gallery paid £2,500 for the large group from the collection of Lord Talbot de Malahide.

Of the master’s numerous family none has left a name except Frans Hals the Younger, born about 1622, who died in 1669. His pictures represent cottages and poultry; and the young, a table laden with gold and silver dishes, cups, glasses and books, is one of his finest works and deserving of a passing glance.

Quite in another form, and with much of the freedom of the elder Hals, Dirk Hals, his brother (born at Haarlem, died 1656), is a painter of festivals and hall-rooms. But Dirk had too much of the freedom and too little of the skill in drawing which characterized his brother. He remains second on his own ground to Palamedes. A fair specimen of his art is a “Lady playing a Harpsichord to a Young Girl and her Lord.” In the Glyptothek, now in the Rysk Museum. More characteristic, but not better, is a large company of gentle-folk rising from dinner, in the Academy at Vienna.

Literature.—See W. Bode, Frans Hals and seine Schule (Leipzig, 1871); W. Unger and W. Vossen, Etchings after Frans Hals (London, 1901); Sir Anthony Vandyke Cope and Frans Hals (London, 1879); D. Knaefuss, Frans Hals (Leipzig, 1896); G. S. Davies, Frans Hals (London, 1902). (F. G. K.)

HALSBURY, HARDINGE STANLEY GIFFARD, 1ST EARL OF (1825—1917), English lord chancellor, son of Stanley Lees Giffard, LL.D., was born in London on the 3rd of September 1825. He was educated at Merion College, Oxford, and was called to the bar at the Inner Temple in 1850, joining the North Wales and Chester circuit. Afterwards he had a large practice at the central criminal court and the Middlesex sessions, and he was for several years junior prosecuting counsel to the treasury. He was engaged in most of the celebrated trials of his time, including the Overend and Gurney and the Tichborne cases. He became queen’s counsel in 1865, and a bencher of the Inner Temple. Mr Giffard twice contested Cardiff in the Conservative interest, in 1868 and 1874, but he was still without a seat in the House of Commons when he was appointed solicitor-general by Disraeli in 1875 and received the honour of knighthood. In 1877 he succeeded in obtaining a seat, when he was returned for Lancauston, which borough he continued to represent until his elevation to the peerage in 1885. He was then created Baron Halsbury and appointed lord chancellor, thus forming a remarkable exception to the rule that no criminal lawyer ever reaches the woolsack. Lord Halsbury resumed the position in 1886 and held it until 1892 and again from 1895 to 1905, his tenure of the office, broken only by the brief Liberal ministries of 1896 and 1892–1893, being longer than that of any lord chancellor since Lord Eldon. In 1895 he was created earl of Halsbury and Viscount Tiverton. Among Conservative lord chancellors Lord Halsbury must always hold a high place, his grasp of legal principles and mastery in applying them being pre-eminent among the judges of his day.

HALSTEAD, a market-town in the Maldon parliamentary division of Essex, England, on the Colne, 17 m. N.N.E. from Chelmsford; served by the Colne Valley railway from Chappel Junction on the Great Eastern railway. Pop. of urban district (1901), 6,673. It lies on a hill in a pleasant wooded district. The church of St Andrew is mainly Perpendicular. It contains a monument supposed to commemorate Sir Robert Bourchier (d. 1349), lord chancellor to Edward III. The Lady Mary Ramsay grammar school dates from 1594. There are large silk and crape works. Two miles N. of Halstead is Little Maplestead, where the church is the latest in date of the four churches with round naves extant in England, being perhaps of 12th-century foundation, but showing early Decorated work in the main. The chancel, which is without aisles, terminates in an apse.

Three miles N.W. from Halstead are the large villages of Silke Hedingham (pop. 1,370) and Castle Hedingham (pop. 1,097). At the second is the Norman keep of the de Veres, of whom Aubrey de Vere held the lordship from William I. The keep dates from the end of the 11th century, and exhibits much fine Norman work. The church of St Nicholas, Castle Hedingham, has fine Norman, Transitional and Early English details, and there is a black marble tomb of John de Vere, 17th earl of Oxford (d. 1540), with his countess.

There are signs of settlement at Halstead (Halsteda, Halygusted, Halsted) in the Bronze Age; but there is no evidence of the first Old English times. Probably its situation on the river Colne made it to some extent a local centre. Throughout the middle ages Halstead was unimportant, and never rose to the rank of a borough.

Halt. (1) An adjective common to Teutonic languages and still appearing in Swedish and Danish, meaning lame, crippled. It is also used as a verb, meaning to limp, and as a substantive, especially in the term "string-halt," or "spring-halt," a nervous disorder affecting the muscles of the hind legs of horses. (2) A pause or stoppage made on a march or a journey. The word came into English in the form "to halt." This word was taken from the French faire falte or Italian far faro. The origin is a German military term, Halt machen, halt meaning "hold."

HALUNTIUM (Gr. Ἑλυντίον, mod. S. Marco d’Alunzio), an ancient city of Sicily, 6 m. from the north coast and 25 m. E.N.E. of Halaea. It was probably of Sicel origin, though its foundation was ascribed to some of the companions of Aeneas. It appears first in Roman times as a place of some importance, and suffered considerably at the hands of Verres. The abandoned church of St. Mark, just outside the modern town, is built on the cella of an ancient Greek temple, which measures 62 ft. by 50. A number of ancient inscriptions have been found there.

HALYBURTON, JAMES (1518–1589), Scottish reformer, was born in 1518, and was educated at St Andrews, where he graduated M.A. in 1538. From 1533 to 1536 he was provost of St Andrews and a prominent figure in the national life. He was chosen as one of the lords of the congregation in 1557, and commanded the contingents sent by Forfar and Fife against the queen regent in 1559. He took part in the defence of Edinburgh, and in the battles of Langside (1568) and Restalrig (1571). He had stoutly opposed the king’s return to the Roman church. After Restalrig, he was captured by the queen’s troops, he narrowly escaped execution. He represented Morton at the conference of 1578, and was one of the royal commissioners to the General Assembly in 1582 and again in 1588. He died in February 1589.

HALYBURTON, THOMAS (1674–1712), Scottish divine, was born at Duppilin, near Perth, on the 25th of December 1674. His father, one of the ejected ministers, having died in 1682, he was taken by his mother in 1685 to Rotterdam to escape persecution, where he for some time attended the school founded by Erasmus. On his return to his native country in 1687 he completed his elementary education at Perth and Edinburgh, and in 1696 graduated at the university of St Andrews. In 1700 he was ordained minister of the parish of Ceres, and in 1710 he was recommended by the synod of Fife for the chair of theology in St Leonard’s College, St Andrews, to which accordingly he was appointed by Queen Anne. After a brief term of active professorial life he died from the effects of overwork in 1712.

The works by which he continues to be known were all of them published after his death. Wesley and Whitefield were accustomed to oppose them to their followers. They were published as follows: Natural Religion Insufficient, and Revealed Religion Necessary, to Man’s Happiness in his Present State (1714), an able statement of the orthodox Calvinistic criticism of the deism of Lord Bolingbroke; The Life and Times of Sir Wilfrid Hope and Charles Blount, Memoirs of the Life of Mr Thomas Halyburton (1715), three parts by his own hand, the fourth from his diary by another hand; The Great Concern of Sabbath Keeping (1715), with the preface and foundation by I. Watts; Ten Sermons Preached Before and After the Lord’s Supper (1722); The Unpardonable Sin Against the Holy Ghost (1784). See Halyburton’s Memoirs (1714).
HAM, in the Bible. (1) Hâm, in Gen. v. 32, vi. 10, vii. 13, ix. 18, x. 5, 1 Chron. 1. 4, the second son of Noah; in Gen. ix. 24, the youngest son (but cf. below); and in Gen. x. 6, 1 Chron. 8, the father of Cush (Ethiopia), Mizraim (Egypt), Phut and Canaan. Genesis x. exhibits in the form of genealogies the political, racial and geographical relations of the peoples known to Israel and it was compiled, the great name and has been much since intervening wars have taken place, it does not exactly represent the situation at any given date, but Ham seems to stand roughly for the south-western division of the world as known to Israel, which division was regarded as the natural sphere of influence of Egypt. Ham is held to be the Egyptian word Khem (black) which was the native name of Egypt; thus in Ps. lxxviii. 51, cv. 23, 27, cvi. 22 Häm=Egypt. In Gen. ix. 20-26 Canaan was originally the third son of Noah and the villain of the story. Ham is a later addition to harmonize with other passages.

(2) Hâm, 1 Chron. iv. 40, apparently the name of a place or tribe. It can hardly be identical with (1); nothing else is known of this second Ham, which may be a scribe's error; the Syriac version rejects the name.

(3) Hâm, Gen. xiv. 5; the place where Chedorlaomer defeated the Zuzim, apparently in eastern Palestine. The place is unknown, and the name may be a scribe's error, perhaps for Ammon. (W. H. Br.)

HAM, a small town of northern France, in the department of Somme, 36 m. E.S.E. of Amiens on the Northern railway between that city and Laon. Pop. (1906), 2979. It stands on the Somme in a marshy district where market-gardening is carried on. From the 9th century onwards it appears as the seat of a lordship, which, after the extinction of its hereditary line, passed in succession to the houses of Coucy, Enghien, Luxembourg, Rohan, Vendôme and Navarre, and was finally united to the French crown on the accession of Henry IV. Notre-Dame, the church of an abbey of canons regular of St Augustin, dates from the 12th and 13th centuries, but in 1760 all the inflammable portions of the building were destroyed by a conflagration caused by lightning and the restoration was subsequently carried out. Of special note are the hair-reliefs of the nave and choir, executed in the 12th and 13th centuries, and the crypt of the 12th century, which contains the sepulchral effigies of Odo IV. of Ham and his wife Isabella of Béthencourt. The castle, founded before the 10th century, was rebuilt early in the 13th, and extended in the 14th; its present appearance is mainly due to the constant Louis of Luxembourg, count of St Pol, who between 1436 and 1470 not only furnished it with outworks, but gave such a thickness to the towers and curtains, and more especially to the great tower or donjon which still bears his motto Mon Meyven, that the late architect Viollet-le-Duc considered them, even in the 19th century, capable of resisting artillery. It forms a rectangle 305 ft. long by 263 ft. broad, with a round tower at each angle and two square towers protecting the curtains. The eastern and western sides are each defended by a demi-lune. The Constable's Tower, for so the great tower is usually called in memory of St Pol, has a height of about 100 ft., and the thickness of the walls is 36 ft.; the interior is occupied by three large hexagonal chambers in as many stories. The castle of Ham, which now serves as barracks, has frequently been used as a state prison both in ancient and modern times, and the list of those who have sojourned there is an interesting one, including as it does Joan of Arc, Louis of Bourbon, the ministers of Charles X., Louis Napoleon, and Generals Cavaignac and Lamoricière. Louis Napoleon was there for six years, and at last effected his escape in a disguise of a workman. During 1870-1871 Ham was several times captured and recaptured by the belligerents. A statue commemorates the birth in the town of General Foy (1775-1825).

Hâmadân, a province and town of Persia. The province is bounded N. by Gerrus and Khamseh, W. by Kermanshah, S. by Malâyir and Irâk, E. by Savâh and Kazvîn. It has many well-watered, fertile plains and more than four hundred flourishing villages producing much grain, and its population, estimated at 350,000—more than half being Turks of the Karaguzu (black-eyed) and Shâmilu (Syrian) tribes—supplies several battalions of infantry to the army, and pays, besides, a yearly revenue of about £18,000.

Hamadân, the capital of the province, is situated 188 m. W.S.W. of Teheran, at an elevation of 5930 ft., near the foot of Mount Elvend (old Persian Arand, Gr. Orontes), whose granite peak rises W. of it to an altitude of 11,000 ft. It is a busy trade centre with about 40,000 inhabitants (comprising 4000 Jews and 300 Armenians), has extensive and well-stocked bazaars and fourteen large and many small caravanserais. The principal industries are tanning leather and the manufacture of saddles, harnesses, trunks, and other leather goods, felts and copper utensils. The leather of Hamadân is much esteemed throughout the country and exported to other provinces in great quantities. The streets are narrow, and by a system called Kûcheh-bandi (street-closing) established long ago for impeding the circulation of crowds and increasing general security, every quarter of the town, or block of buildings, is shut off from its neighbours by gates which are closed during local disorders and regularly at night. Hamadân has post and telegraph offices and two church missions, one the Roman Catholic and the other Protestant (of the American Presbyterian Mission).

Among objects of interest are the alleged tombs of Esther and Mordecai in an insignificant domed building in the centre of the town. There are two wooden sarcophagi carved all over with Hebrew inscriptions. That ascribed to Mordecai has the verses Issiah lix. 8; Esther ii. 5; Ps. xvi. 9, 10, 11, and the date of its erection A.M. 4318 (A.D. 557). The inscriptions on the other sarcophagi consist of the verses Esther ix. 20, 32, x. 1; and the statement that it was placed there A.M. 4002 (A.D. 519) by “Sarath and righteous woman Gemal Setan.” A tablet let into the wall states that the building was repaired A.M. 4474 (A.D. 713). Hamadân also has the grave of the celebrated physician and philosopher Abu Ali ibn Sina, better known as Avicenna (d. 1036). It is now generally admitted that Hamadân is the Hagmatana (of the inscriptions), Agbatana or Ecbatana (v.g., of the Greek writers), the “treasure city” of the Achaemenian kings which was taken and plundered by Alexander the Great, but very few ancient remains have been discovered. A rudely carved stone lion, which lies on the roadside close to the source of extremity of the city, and by some is supposed to have formed part of a building of the ancient city, is locally regarded as a talisman against famine, plague, cold, &c., placed there by Pliny, who is popularly known as the sorcerer Balâni (a corruption of Pliinius).

Five miles S.W. from the city in a mountain gorge of Mount Elvend is the so-called Ganj nâma (treasure-deed), which consists of two tablets with trilingual cuneiform inscriptions cut into the rock and relating the names and titles of Darius I (521-485 B.C.) and his son Xerxes I (485-465 B.C.). (A.-H.S.)

HAMADHÂNÎ, in full ABO-UL-FAXD-ARMAD IBN UL-HUSAIN UL-HAMADHÂNÎ (667-1007), Arabian writer, known as Bâdi‘ uz-Zamân (the wonder of the age), was born and educated at Hamadân. In 990 he went to Jorjân, where he remained two years; then passing to Nishapûr, where he ravedl and surpassed the learned Khwârizmî. After journeying through Khorasan and Sijistân, he finally settled in Herât under the protection of the vizir of Mahmoud, the Ghaznevid sultan. There he died at the age of forty. He was renowned for a remarkable memory and for fluency of speech, as well as for the purity of his language. He was one of the first to renew the use of rhyme and prosody, both in letters and maqâmas (see ARABA: Literatur, section “Belles Lettres”).

His letters were published at Constantinople (1881), and with commentary at Beirut (1890); his maqâmâs at Constantinople (1881), and with commentary at Beirut (1889). A good idea of the
HAMAH—HAMAR

of his writings, and which undoubtedly alienated many of his friends. He returned to Riga, and was well received by the Behrens family, in whose house he resided for some time. A quarrel, the precise nature of which is not very clear though the occasion is evident, led to an entire separation from these friends. In 1750 Hamann returned to Königsberg, and lived for several years with his father, filling occasional posts in Königsberg and Berlin. In 1757 he obtained a temporary appointment as an excise officer, and ten years later a post as storekeeper in a mercantile house. During this period of comparative rest Hamann was able to indulge in the long correspondence with learned friends which seems to have been his greatest pleasure. In 1754 the failure of some commercial speculations greatly reduced his means, and about the same time he was dismissed with a small pension from his situation. The kindness of friends, however, supplied provision for his children, and enabled him to carry out the long-cherished wish of visiting some of his philosophical allies. He spent some time with Jacob at Pempfort and with Buchholz at Walrben. At the latter place he was seized with illness, and died on the 21st of June 1758.

Hamann's works resemble his life and character. They are entirely unsystematic so far as matter is concerned, chaotic and disjointed in style. To a reader not acquainted with the peculiar character of the man, his works may present him to himself as if the book is merely a collection of his off-hand thoughts. But to one who is acquainted with Hamann, his works present him as a whole character, unified by the thought of which they are the expressions.

The ideas of which Hamann's works are composed are of the first importance. They are the ideas of a great thinker, the ideas of a great philosopher; they are the ideas of a man who knew the mind of man, and who understood the nature of the truths that are to be discovered by the mind of man. They are the ideas of a man who was not only a great philosopher, but a great poet, a great writer, a great artist, a great thinker. They are the ideas of a man who was not only a great philosopher, but a great poet, a great writer, a great artist, a great thinker.

Hamann's works resemble his life and character. They are entirely unsystematic so far as matter is concerned, chaotic and disjointed in style. To a reader not acquainted with the peculiar character of the man, his works may present him to himself as if the book is merely a collection of his off-hand thoughts. But to one who is acquainted with Hamann, his works present him as a whole character, unified by the thought of which they are the expressions.
HAMASA

The compiler was himself a distinguished poet in the style of his day, and wandered through many provinces of the Moslem empire earning money and fame by his skill in panegyric. About 220 A.H. he betook himself to Khurasan, then ruled by 'Abdallah ibn 'Abar, whom he praised and by whom he was rewarded; on his journey home to 'Trak he passed through Hamadhân, and was there detained for many months a guest of Abu-l-Wafa, son of Salama, the road onward being blocked by heavy falls of snow. During his residence at Hamadhân, Abu Tammâm is said to have compiled or composed, from the materials which he found in Abu-l-Wafa’s library, five poetical works, of which one only is still known by his name. This collection remained as a precious heirloom in the family of Abu-l-Wafa until their forced dispersion, when it fell into the hands of a man of Dihawar named Abu-l-'Awadîl, who carried it to Isfahan and made it known to the learned of that city.

The worth of the Hamasa as a store-house of ancient legend, of faithful detail regarding the usages of the pagan time and early simplicity of the Arab race, can hardly be exaggerated. The high level of excellence which is found in its selections, both as to form and matter, is remarkable, and caused it to be said that Abu Tammâm displayed higher qualities as a poet in his choice of themes and his treatment of them than any other Moslem poet. What strikes us chiefly in the class of poetry of which the Hamasa is a specimen, is its exceeding truth and reality, its freedom from artificiality and hearsay, the evident first-hand experience which the singers possessed of all of which they sang. For historical purposes the value of the collection is not small; but most of all there shines forth from it a complete portraiture of the hardy and manly nature, the strenuous life of passion and battle, the lofty contempt of cowardice, niggardliness and servility, which marked the valiant stock who bore Islam through a flood of new life over the outworn civilizations of Persia, Egypt and Byzantium. It has the true stamp of the heroic time, of its cruelty and wantonness as of its strength and beauty.

No fewer than twenty commentaries are enumerated by Hâjî Khalîfâ. Of these the earliest was by Abû Riyâsh (otherwise ar-Riyâshî), who died in 257 A.H.; excerpts from it, chiefly in elucidation of the circumstances in which the poems were composed, are frequently given by at-Tibrîzî (Tabrizî). He was followed by the famous grammarian Abu-l-Fâth ibn al-Jâmi (392 A.H.), and later by Shîhâb ad-Dîn Ahmad al-Marzûqî of Isfahan (d. 421 A.H.). Upon whose compositions, on the whole, at-Tibrîzî (b. 421 A.H., d. 502), which has been published by the late Professor G. W. Freytag of Bonn, together with a Latin translation and notes (1828–1831). This monumental work, the first attempt to render into the language of the modern reader, is still thought the standard translation of most of the poems, which is the chief text with which at-Tibrîzî’s commentary, has been reprinted at Bâlât (1870). In 1882 an edition of the text, with a marginal commentary by Munshi ‘Abdul-Qâhir ibn Shaikh Luqman, was published at Bombay.

The Hamasa has been rendered with remarkable skill and spirit into German verse by the illustrious Friedrich Rückert (Stuttgart, 1845), who has not only given translations of almost all the poems proper to the work, but has added, besides, some of the fragments, especially occurring in the collection of at-Tibrîzî, as well as in the Ma’allaqas of Zuhair and ‘Antara, the Lamiyya of Ash-Shanfar, and the Bnata Sâ’d of Ka‘b, son of Zuhair. A small number of the verses, freely in the style of translation, freely in the style of translation, from which the original, was published in London by Sir Charles Lyall in 1885.

When the Hamasa is spoken of, that of Abu Tammâm, as the first and most famous of the name, is meant; but several collections of modern verse, also called Hamasa, exist. The best-known and earliest of these is the Hamasa of Buhturi (d. 284 A.H.), of which the unique MS., now in the Leiden University Library, has been reproduced by photo-lithography (1909); a critical edition has been
HAMBURG, a state of the German empire, on the lower Elbe, bounded by the Prussian provinces of Schleswig-Holstein and Hanover. The whole territory has an administrative area, including both the city and the surrounding suburbs and the surrounding district, including several islands in the Elbe, five small enclaves in Holstein; the communes of Moorburch in the Lüneburg district of the Prussian province of Hanover and Cuxhaven-Ritzebüttel at the mouth of the Elbe, the island of Neuwerk about 5 m. from the coast, and the balliwick (amt) of Bergedorf, which down to 1867 was held in common by Lübeck and Hamburg. Administratively the state is divided into the city, or metropolitan district, and four rural domains (or Landherrenschaften), each under a senator as præses, viz., the domain of the Geestlande, of the Marschlande, of Bergedorf and of Ritzebüttel with Cuxhaven. Cuxhaven-Ritzebüttel and Bergedorf are the only towns besides the capital. The Geestlande comprise the suburban districts encircling the city on the north and west; the Marschlande includes various islands in the Elbe and the fertile tract of land lying between the northern and southern arms of the Elbe, and with its pastures and market gardens supplying Hamburg with large quantities of country produce. In the Bergedorf district lies the Vierlande, or four districts (Neuenburg, Kirchwörder, Altemunde and Cuxhaven), celebrated for its fruit gardens and the picturesque dress of the inhabitants. Ritzebüttel with Cuxhaven, also a watering-place, have mostly a seafaring population. Two rivers, the Alster and the Bille, flow through the city of Hamburg into the Elbe, the mouth of which, at Cuxhaven, is 75 m. below the city.

Government.—As a state of the empire, Hamburg is represented in the federal council (Bundesrat) by one plenipotentiary, and in the imperial diet (Reichstag) by three deputies. Its present constitution came into force on the 1st of January 1861, and was revised in 1859 and again in 1896. According to this Hamburg is a republic, the government (Staatsgewalt) residing in two chambers, the Senate and the House of Burgess. The Senate, which exercises the greater part of the executive power, is composed of eighteen members, one half of whom must have studied law or finance, while at least seven of the remainder must belong to the class of merchants. The members of the Senate are elected for life by the House of Burgess; but a senator is free to retire from office at the expiry of six years. A chief (ober-) and second (unter-) burgomaster, the first of whom bears the title of "Magnificence," chosen annually in secret ballot, preside over the meetings of the Senate, and are usually jurists. No burgomaster can be in office for longer than two years consecutively, and no member of the Senate may hold any other public office. The House of Burgess consists of 160 members, of whom 80 are elected in secret ballot by the direct suffrages of all tax-paying citizens, 40 by the owners of house-property within the city (also by ballot), and the remaining 40, by ballot also, by the so-called "notables," i.e. active and retired merchants and manufacturers exercising a special influence. They are elected for a period of six years, but as half of each class retire at the end of three years, new elections for one half the number take place at the end of that time. The House of Burgesses is represented by a Bürgerausschuss (committee of the house) of twenty deputies whose duty it is to watch over the proceedings of the Senate and the constitution generally. The Senate can interpose a veto in all matters of legislation, saving taxation, and where there is a collision between the two bodies, provision is made for reference to a court of arbitration, consisting of members of both houses in equal numbers, and also to the supreme court of the empire (Reichsgericht) sitting at Leipzig. The law administered is that of the civil and penal codes of the German empire, and the court of appeal for all three Hanse towns is the common Oberlandesgericht, which has its seat in Hamburg. There is also a special court of arbitration in commercial disputes and another for such as arise under accident insurance.

Religion.—The church in Hamburg is completely separated from the state and manages its affairs independently. The ecclesiastical arrangements of Hamburg have undergone great modifications since the general constitution of 1860. From the Reformation to the French occupation at the beginning of the 17th century, Hamburg was a purely Lutheran state; according to the "Recess" of 1539, re-enacted in 1653, non-Lutherans were subject to legal punishment and expulsion from the country. Exceptions were gradually made in favour of foreign residents; but it was not till 1785 that regular inhabitants were allowed to exercise the religious rites of other denominations, and it was not till after the war of freedom that they were allowed to have buildings in the style of churches. In 1860 full religious liberty was guaranteed, and the identification of church and state abolished. By the new constitution of the Lutheran Church, published at first in 1870 for the city only, but in 1876 extended to the rest of the Hamburg territory, the parishes or communes are divided into three church-districts, and the general affairs of the whole community are entrusted to a synod of 53 members and to an ecclesiastical council of 9 members which acts as an executive. Since 1887 a church rate has been levied on the Evangelical-Lutheran communities, and since 1904 upon the Roman Catholics also. The German Reformed Church, the French Reformed, the English Episcopal, the English Reformed, the Roman Catholic, and the Baptist are all recognized by the state. Civil marriages have been permissible in Hamburg since 1866, and since the introduction of the imperial law in January 1876 the number of such marriages has greatly increased.

Finance.—The jurisdiction of the Free Port was on the 1st of January 1882 restricted to the city and port by the extension of the Zollverein to the lower Elbe, and in 1888 the whole of the state of Hamburg, with the exception of the so-called "Free Harbour" (which comprises the port proper and some large warehouses, set apart for goods in bond), was taken into the Zollverein.

Population.—The population increased from 452,000 in 1880 to 622,530 in 1890, and in 1905 amounted to 874,878. The population of the country districts (exclusive of the city of Hamburg) was 72,685 in 1905. The crops raised in the country districts are principally vegetables and fruit, potatoes, hay, oats, rye and wheat. For manufactures and trade statistics see HAMBURG (city).

The military organization of Hamburg was by convention with Prussia. The state possesses three battalions of the 2nd Hanseatic regiment, under Prussian officers. The soldiers swear the oath of allegiance to the senate.

HAMBURG, a seaport of Germany, capital of the free state of Hamburg, on the right bank of the northern arm of the Elbe, 75 m. from its mouth at Cuxhaven and 178 m. N.W. from Berlin by rail. It is the largest and most important seaport on the continent of Europe and (after London and New York) the third largest in the world. Were it not for political and municipal boundaries Hamburg might be considered as forming with Altona and Ottensen (which lie within Prussian territory) one town. The city, surrounded with strong fortifications, protruding a continuous line from six miles, the river crowded with shipping and the densely packed houses surmounted by church towers—of which three are higher than the dome of St Paul's in London—is one of great magnificence.

The city proper lies on both sides of the little river Alster, which, dammed up a short distance from its mouth, forms a lake, of which the southern portion within the line of the former fortifications bears the name of the Inner Alster (Binnen Alster), and the other and larger portion (2500 yards long and 1500 yards at the widest) that of the Outer Alster (Außen Alster). The fortifications as such were removed in 1815, but they have left their trace in a fine girdle of green round the city, though too many inroads on its completeness have been made by railways and roadways. The oldest portion of the city is that which lies prepared by Professor Chilikho at Beyreuth. Four other works of the same name, formed on the model of Abb Tammann's compilation, are mentioned by Bajji and Haskell. Besides these, a work entitled Hanauz ar-Radâ ("the Hamburg of wine") was composed of Abu-l-'Ala al-Ma'arri (d. 429 A.H.). (C. J. L.)
to the east of the Alster; but, though it still retains the name of Altstadt, nearly all trace of its antiquity has disappeared, as it was rebuilt after the great fire of 1842. To the west lies the new town (Neustadt), incorporated in 1678; beyond this and contiguous to Altona is the former suburb of St Pauli, incorporated in 1875, and towards the north-east that of St Georg, which arose in the 13th century but was not incorporated till 1868.

The old town lies low, and it is traversed by a great number of narrow canals or "fleets" (Fleoten)—for the same word which has left its trace in London nomenclature is used in the Low German city—which add considerably to the picturesque ness of the meander quarters, and serve as convenient channels for the transport of goods. They generally form what may be called the back streets, and they are bordered by warehouses, cellars and the lower class of dwelling-houses. As they are subject to the eb and flow of the Elbe, at certain times they run almost dry. As soon as the telegram at Cuxhaven announces high tide three shots are fired from the harbour to warn the inhabitants of the "fleets"; and if the progress of the tide up the river gives indication of danger, other three shots follow. The "fleets" with their quaint medieval warehouses, which come sheer down to the water, and are navigated by barges, have gained for Hamburg the name of "Northern Venice." They are, however, though antique and interesting, somewhat dismal and unsavoury. In fine contrast to them is the bright appearance of the Binnen Alster, which is enclosed on three sides by handsome rows of buildings, the Alsterdamm in the east, the Alter Jungfernstieg in the south, and the Neuer Jungfernstieg in the west, while it is separated from the Aussen Alster by part of the rampart gardens traversed by the railway uniting Hamburg with Altona and crossing the lakes by a beautiful bridge—the Lombardsbrücke. Around the outer lake are grouped the suburbs Harvestehude and Pösseldorf on the western shore, and Uhlenhorst on the eastern, with park-like promenades and villas surrounded by well-kept gardens. Along the southern end of the Binnen Alster runs the Jungfernstieg with fine shops, hotels and restaurants facing the water. A fleet of shallow-draught screw steamers provides a favourite means of communication between the business centre of the city and the outlying colonies of villas.

The streets enclosing the Binnen Alster are fashionable promenades, and leading directly from this quarter are the main business thoroughfares, the Neuer-Wall, the Grosse Bleichen and the Herrmannstrasse. The largest of the public squares in Hamburg is the Hopfenmarkt, which contains the church of St Nicholas (Nikolaikirche) and is the principal market for vegetables and fruit. Others of importance are the Gänsemarkt, the Zeughausmarkt and the Grossneumarkt. Of the thirty-five churches existing in Hamburg (the old cathedral had to be taken down in 1805), the St Petrikirche, Nikolaikirche, St Katharinenkirche, St Jakobikirche and St Michaeliskirche are those that
HAMBURG

873
give their names to the five old city parishes. The Nikolaikirche is especially remarkable for its spire, which is 473 ft. high and ranks, after those of Ulm and Cologne, as the third highest ecclesiastical edifice in the world. The old church was destroyed in the great fire of 1842, and the new building, designed by Sir George Gilbert Scott in 13th century Gothic, was erected 1845-1854. The exterior and interior are elaborately adorned with sculptures. Sandstone from Osterwald near Hildesheim was used for the outside, and for the inner work a softer variety from Postelwitz near Dresden. The Michaeliskirche, which is built on the highest point in the city and has a tower 428 ft. high, was erected (1750-1762) by Ernst G. Sonnin on the site of the older building of the 17th century destroyed by lightning; the interior, which can contain 3000 people, is remarkable for its bold construction, there being no pillars. The St. Petrikirche, originally consecrated in the 12th century and rebuilt in the 14th, was the oldest church in Hamburg; it was burnt in 1842 and rebuilt in its old form in 1842-1849. It has a graceful tapering spire 402 ft. in height (completed 1878); the granite columns from the old cathedral, the stained glass windows by Kellner of Nuremberg, and H. Schubert's fine relief of the entombment of Christ are worthy of notice. The St Katharinenkirche and the St Jakobikirche are the only surviving medieval churches, but neither is of special interest. Of the numerous other churches, Evangelical, Roman Catholic and Anglican, none are of special interest. The new synagogue was built by Rosengarten between 1855 and 1859, and the new Jewish temple and banquet hall built for the Hamburg merchant prince Johann Heinrich, Freiherr von Schröder (1784-1833), is in the churchyard of the Petrikirche. The beautiful chapel of St Gertrude was unfortunately destroyed in 1842.

Hamburg has comparatively few secular buildings of great architectural interest, but first among them is the new Rathaus, a huge German Renaissance building, constructed of sandstone in 1886-1887, richly adorned with sculptures and with a spire 330 ft. in height. It is the place of meeting of the municipal council and of the senate and contains the city archives. Immediately adjoining it and connected with it by two wings is the exchange. It was erected in 1836-1841 on the site of the convent of St Mary Magdalen and escaped the conflagration of 1842. It was restored and enlarged in 1904, and shelters the commercial library of nearly 100,000 vols. During the business hours (1-3 p.m.) the exchange is crowded by some 5000 merchants and brokers. In the same neighbourhood is the Johanneum, erected in 1833 and in which are preserved the town library of about 600,000 printed books and 5000 MSS. and the collection of Hamburg antiquities. In the courtyard is a statue (1882) of the reformer Johann Bugenhagen. In the Fischmarkt, immediately south of the Johanneum, a handsome fountain was erected in 1890. Directly west of the town hall is the new Stadthaus, the chief police station of the town, in front of which is a bronze statue of the burgomaster Karl Friedrich Petersen (1800-1892), erected in 1897. A little farther away are the headquarters of the Patriotic Society (Patriotische Gesellschaft), founded in 1765, with fine rooms for the meetings of artistic and learned societies. Several new public buildings have been erected during the last twenty years, and the tramway line network of the city has been extended to the great extent, abutting upon the Elbe, the most filled in in 1854-1857, and some good streets were built along the site, while the Kersten Miles-Brücke, adorned with statues of four Hamburg heroes, was thrown across the Helgoländer Allee. Farther north, along the line of the former town wall, are the criminal law courts (1879-1882, enlarged 1893) and the civil law courts (finished in 1901). Close to the latter stand the new supreme court, the old age and accident state insurance offices, the chief custom house, and the concert hall, founded by Karl Laeisz, a former Hamburg wharfer. Farther on are the chemical and the physical laboratories and the Hygienic Institute. Facing the botanical gardens a new central post-office, in the Renaissance style, was built in 1887. At the west end of the Lombards-Brücke there is a monument to Lessing (1881); while occupying a commanding site on the promenades towards Altona is the gigantic statue of Bismarck which was unveiled in June 1906. The Kunsthalle (the picture gallery), containing some good works by modern masters, faces the east end of Lombards-Brücke. The new Natural History Museum, completed in 1897, stands a little distance farther south. To the east of it comes the Museum for Art and Industry, founded in 1878, now one of the most important institutions of the kind in Germany, with which is connected a trades school. Close by is the Hansa-fountain (65 ft. high), erected in 1878. On the north-east side of the suburb of St Georg a botanical museum and laboratory have been established. There is a new general hospital at Eppendorf, outside the town on the north, built on the pavilion principle, and one of the finest structures of the kind in Europe; and at Ohlsdorf, in the same direction, a crematorium was built in 1891 in conjunction with the town cemeteries (370 acres). There must also be mentioned the fine public zoological gardens, Hagenbeck’s private zoological gardens in the vicinity, the schools of music and navigation, and the school of commerce. In 1900 a high school for shipbuilding was founded, and in 1901 an institute for seamen’s and tropical diseases, with a laboratory for their physiological study, was opened, and also the first free public library in the city. The river is spanned just above the Frei Hafen by a triple-arched railway bridge, 1339 ft. long, erected in 1868-1873 and doubled in width in 1894. Some 270 miles of tramway lines, besides the streets, connect each of the city districts with the outer suburbs.

Railways.—The through railway traffic of Hamburg is practically confined to that proceeding northwards—to Kiel and Jutland —and for the accommodation of such trains the central (terminus) station at Altona is the chief gathering point. The Hamburg stations, connected with the other by the Verbindungs-Bahn (or metropolitan railway) crossing the Lombards-Brücke, are those of the Venloer (or Hanoverian, as it is often called) Bahnhof on the south-east, in close proximity to the harbour, into which converge the lines from Cologne and Bremen, Hanover and Frankfort-on-Main, and from Berlin, via Nelsen; the Klosterstor-Bahnhof (on the metropolitan line) which temporarily superseded the old Berlin station, and the Lübeck station a little to the north-east, during the erection of the new central station, which occupies a site between the Klosterstor-Bahnhof and the Lombards-Brücke. Between this central station and Altona terminus runs the metropolitan railway, which has been raised several feet so as to bridge the streets, and on which lie the important stations Dammtor and Sternschanze. An excellent service of electric trams interconnect the towns of Hamburg, Altona and the adjacent suburbs, and steamboats provide communication on the Elbe with the riparian towns and villages; and so with Blankenese and Harburg, with Stade, Glückstadt and Cuxhaven.

Trade and Shipping.—Probably there is no place which during the last thirty years of the 19th century grew faster commercially than Hamburg. Its commerce is, however, almost entirely of the former type, of which the railway is not or cannot be the contributing centre for the middle of Europe of the products of all other parts of the world, but is also the chief outlet for German, Austrian, and even to some extent Russian (Polish) raw products and manufactures. Its principal imports are coffee (of which it is the greatest continental market), tea, sugar, spices, rice, wine (especially from Bordeaux), lard (from Chicago), cereals, sago, dried fruits, herrings, wax (from Morocco and Mozambique), tobacco, hemp, cotton (which of late years shows a large increase), wool, skins, leather, oils, dyewoods, indigo, nitrates, phosphates and coal. Of the total importations of all kinds of coal to Hamburg, that of British coal, particularly from Northumberland and Durham, occupies the first place, and despite some falling off in late years, owing to the competition made by Westphalian coal, amounts to more than half the total import. The increase of the trade of Hamburg is most strikingly shown by that of
between present and particularly is Germany Hamburg tonnage such artificial character generally confectionery and food and drink. The import trade of various cereals by sea to Hamburg is very large, and a considerable portion of this corn is converted into flour at Hamburg itself. There are also, in this connexion, numerous bakeries for biscuit, rice-peeling mills and spice mills. Besides the foregoing there are cocoa, chocolate, confectionery and baking-powder factories, coffee-roasting and winemaking and smoking, and the manufacture of tobacco, marine factories and fish-curing, preserving and packing factories. There are numerous breweries, producing annually about 24,000,000 gallons of beer, spirit distilleries and factories of artificial waters. Yarns, textile goods and weaving industries generally have not attained any great dimensions, but there are large jute-spinning mills and factories for cotton-wool and cotton driving-belts. Among other important articles of domestic industry are tobacco and cigars (manufactured mainly in bond, within the free harbour precincts), hydraulic machinery, electro-technical machinery, chemical products (including artificial colouring-matters), oils, soap, rubber, tobacco, ivory and cellarboard articles and the manufacture of leather.

Shipbuilding has made very important progress, and there are at present in Hamburg eleven large shipbuilding yards, employing nearly 10,000 hands. Of these, however, only three of any great extent, and one, where the largest class of ocean-going steamers and of war vessels for the German navy are built, employs about 5000 persons. There are also two yards for the building of pleasure yachts and rowing-boats (in both which branches of sport Hamburg takes a leading place in Germany). Art industries, though numerous, are not those particularly to the luxurious taste of the inhabitants in fitting their houses, such as wall-papers and furniture, and those which are included in the equipment of ocean-going steamers, have of late years made rapid strides and are among the best productions of this character of any German city.

Harbour.—It was the accession of Hamburg to the customs union in 1868 which gave such a vigorous impetus to her more recent commercial development. At the same time a portion of the port was set apart as a free harbour, altogether an area of 750 acres of water and 1750 acres of dry land. In anticipation of this event a gigantic system of docks, basins and quays was constructed, at a total cost of some £5,000,000 (of which the imperial treasury contributed £2,000,000), between the confluent rivers of Alster and Hamburger Allee (1868–1873), an entire quarter of the town inhabited by some 24,000 people being cleared away to make room for these accessories of her commerce. At the north side of this was the Great basin (3380 ft. long, 295 to 427 ft. wide), in which British and Dutch steamers and steamboats of the Sloman (Mediterranean) line anchor. South of this lies the Grassbrook basin (quayage of 2100 ft. and 4630 ft. alongside), which is used by French, Swedish and transatlantic steamers. At the quay point between these two basins there are vast state granaries. On the outer (i.e. river) side of the Grassbrook basin are portions of the old walls for the embark, and from which the mail boats for East Africa, the boats of the Woermann (West Africa) line, and the Norwegian tourist boats depart. To the east of these is the small Magdebureg basin, penetrated by the Basle boat, a large steamship. To the west, parallel to the river, the latter affords accommodation to the transatlantic steamers, including the emigrant ships of the Hamburg-America line, the "ocean mail boats" generally loaded and unloaded at Cuxhaven. On the south bank of the stream there were in succession, going from east to west, the Moldau dock for river craft, the sailing vessel dock (Segelschiff Hafen, 3937 ft. long, 439 to 866 ft. wide, 26 ft. deep), the Hanse dock, India dock, petroleum dock, several swimming and dry docks; and in the west of the free port area three other large docks, one of 77 acres for river craft, the others each 56 acres in extent, and one 231 ft. deep, the other 261 ft. deep, at low water, constructed in 1900–1901. In 1897 Hamburg was provided with a huge floating dock, 558 ft. long and 84 ft. in maximum breadth, capable of holding a vessel of 17,500 tons and draught not exceeding 29 ft., so constructed and equipped that in time of normal seaport weather it could safely receive a vessel of 25 years of the 19th century the channel of the Elbe was greatly improved and deepened, and during the last two years of the 19th century some £300,000 was spent by Hamburg alone in regulating and deepening the channel of the Elbe. The Hamburg basin, on the left bank of the river, as well as two large dock basins (now leased to the Hamburg-America Company), raise the number of basins to twelve.

Emigration.—Hamburg is one of the principal continental ports for the embarkation of emigrants. In 1881–1890, on an average they numbered 90,000 a year (of whom 60,000 proceeded to the United States). In 1890–1900 there were 126,000 emigrants, of whom 43,000 went to the United States (64,137). The number of emigrant Germans has enormously decreased of late years, Russia and Austria-Hungary now being most largely represented. For the accommodation of such passengers large and convenient emigrant shelters have been recently erected close to the wharf of embarkation.

Health and Population.—The health of the city of Hamburg and the Elbe and Alster, as a defence against the Slav, and the epidemic diseases having recently appeared to any serious degree. The malady causing the greatest number of deaths is that of pulmonary consumption; but better housing accommodation has of late years been introduced to the advantage of the inhabitants. The results of the census of 1905 showed the population of the city (not including the rural districts belonging to the state of Hamburg) to be 877,793.

Hamburg is well supplied with places of amusement, especially of the more popular kind. Its Stadt-Theater, rebuilt in 1874, has room for 1750 spectators and is particularly devoted to operatic performances; the Thalia-Theater dates from 1841, and the Old Lady of 1700 to 1800 people, and the Schauspielhaus (for drama) from 1900 people, and there are some seven or eight minor establishments. Dramatic performances have been introduced into the city in the 17th century, and 1678 is the date of the first opera, which was played in a house in the Gänsemarkt. Under Schröder and Lessing the Hamburg stage rose into importance. Though contributing few names to literary history, Hamburg has long been intimately associated with the literary movement. The historian Lappenberg and Friedrich von Hagedorn were born in Hamburg; and not only Lessing, but Heine and Klopstock lived there for some time.

History.—Hamburg probably had its origin in a fortress erected in 811 by Charlemagne, on an elevation between the Slaw and Sax. It was called Hamburgus because of the surrounding forest (Homme). In 811 Charlemagne founded a church here, perhaps on the site of a Saxon place of sacrifice, and this became a great centre for the evangelization of the north of Europe, missionaries from Hamburg introducing Christianity into Jutland and the Danish islands and even into Sweden and Norway. In 834 Hamburg became an archbishopric, St Ansarg, a moik of Corbie and known as the apostle of the North, being the first metropolitan. In 845 church, monastery and town were burnt down by the Norsemen, and two years later the see of Hamburg was united with that of Bremen and its seat transferred to the latter city. The town, rebuilt after this disaster, was again more than once devastated by invading Danes and Slavs. Archbishop Unwan of Hamburg-Bremen (1013–1029) substituted a chapter of canons for the monastery, and in 1037 Archbishop Bezelin (or Alebrand) built a stone cathedral and a palace on the Elbe. In 1110 Hamburg, with Holstein, passed into the hands of Adolph I., count of Schauenburg, and it is with the building of the Neustadt (the present parish of St Nicholas) by his grandson, Adolph II., in 1220, that the history of the commercial city actually begins. In return for a contribution to the costs of a crusade, he obtained from the emperor Frederick I. in 1189 a charter granting Hamburg considerable franchises, including exemption from tolls, a separate court and jurisdiction, and the rights of fishery on the Elbe from the city to the sea. The city council (Rath), first mentioned in 1190, had jurisdiction over both the episcopal and the new town. Craft guilds were already in existence, but these had no share in the government; for, though the Lübeck rule excluding craftsmen from the Rath did not obtain, they were excluded in practice. The counts, of
course, as over-lords, had their Vogt (advocatus) in the town, but this official, as the city grew in power, became subordinate to the Rath, as at Lübeck.

The wealth of the town was increased in 1189 by the destruction of the flourishing trading centre of Bardowieck by Henry the Lion; from this time it began to be dominant among Flemish merchants. In 1207 the city submitted to Valdemar of Schleswig, after his victory over the count of Holstein, but in 1225, owing to the capture of King Valdemar II. of Denmark by Henry of Schwerin, it once more exchanged the Danish over- lordship for that of the counts of Schauenburg, who established themselves here and in 1231 built a strong fort to hold it in check. The defensive alliance of the city with Lübeck in 1241, extended for other purpose by the treaty of 1255, practically laid the foundations of the Hanseatic League (q.v.), of which Hamburg continued to be one of the principal members. The internal organization of the city, too, was rendered more stable by the new constitution of 1270, and the recognition in 1292 of the complete internal autonomy of the city by the count of Schauenburg. The exclusion of the handicraftsmen from the Rath led, early in the 15th century, to a raising of the guilds against the patrician merchants, and in 1430 they forced the latter to recognize the authority of a committee of 48 burgheers, which concluded with the senate the so-called First Recess; there were, however, fresh outbursts in 1458 and 1483, which were settled by further compromises. In 1466 Hamburg did homage to the Emperor, the so-called submission of the Schauenburg counts; but the suzerainty of Denmark was merely nominal and soon repudiated altogether; in 1510 Hamburg was made a free imperial city by the emperor Maximilian I.

In 1529 the Reformation was definitively established in Hamburg by the Great Recess of the 19th of February, which at the same time vested the government of the city in the Rath, together with the three colleges of the Oberalten, the Forty-eight (increased to 60 in 1685) and the Hundred and Forty-four (increased to 186). The ordinary burgheers consisted of the freeholders and the master-workmen of the guilds. In 1536 Hamburg joined the league of Schmalkalden, for which error it had to pay a heavy fine in 1547 when the league had been defeated. During the same period the Lutheran zeal of the citizens led to the expulsion of the Mennonites and other Protestant sects, who founded Altona. The loss this brought to the city was, however, compensated for by the immigration of Protestant refugees from the Low Countries and Jews from Spain and Portugal. In 1549, too, the English merchant adventurers removed their staple from Antwerp to Hamburg. The first staple of Hamburg was established, so early as the 16th century, a regular postal service with certain cities in the interior of Germany, e.g. Leipzig and Breslau; in 1615 it was included in the postal system of Turn und Taxis. In 1603 Hamburg received a code of laws regulating exchange, and in 1619 the bank was established. In 1615 the Neustadt was included within the city walls. During the Thirty Years' War the city received no direct harm; but the ruin of Germany reacted upon its prosperity, and the misery of the lower orders led to an agitation against the Rath. In 1685, at the instigation of the city, the Emperor laid a heavy tax on Hamburg demanding the traditional homage; they were repulsed, but the internal troubles continued, culminating in 1708 in the victory of the democratic factions. The imperial government, however, intervened, and in 1712 the "Great Recess" established durable good relations between the Rath and the commanalty. Frederick IV. of Denmark, who had seized the opportunity to threaten the city (1712), was bought off with a ransom of 246,000 Reichsthaler. Denmark, however, only finally renounced her claims by the treaty of Gottorp in 1763, and in 1770 Hamburg was admitted for the first time to a reparation in the diet of the empire.

The trade of Hamburg received its first great impulse in 1783, when the United States, by the treaty of Paris, became an independent power. From this time dates its first direct maritime communication with America. Its commerce was further extended and developed by the French occupation of Holland in 1795, when the Dutch trade was largely directed to its port. The French Revolution and the insecurity of the political situation, however, exercised a depressing and retarding effect. The wars which ensued, the closing of continental ports against English trade, the occupation of Hamburg in 1803, and the consular massacres of the battle of Jena, and pestilence within its walls brought about a severe commercial crisis and caused a serious decline in its prosperity. Moreover, the great contributions levied by Napoleon on the city, the plundering of its bank by Davoust, and the burning of its prosperous suburbs inflicted wounds from which the city but slowly recovered. Under the long peace which followed the close of the Napoleonic wars, its trade gradually revived, fostered by the declaration of independence of South and Central America, with both of which it energetically opened close commercial relations, and by the introduction of steam navigation. The first steamboat was seen on the Elbe on the 17th of June 1816; in 1826 a regular steam communication was opened with London; and in 1856 the first direct steampath line linked the port with the United States. The great fire of 1842 (5th-8th of May) laid in waste the greatest part of the business quarter of the city and caused a temporary interruption of its commerce. The city, however, soon rose from its ashes, the churches were rebuilt and new streets laid out on a scale of considerable magnificence. In 1866 Hamburg joined the North German Federation, and in 1871, while remaining outside the Zollverein, became a constituent state of the German empire.

In 1883-1888 the works for the Free Harbour were completed, and on the 18th of October 1888 Hamburg joined the Customs Union (Zollverein). In 1892 the cholera raged within its walls, carried off 800 of its inhabitants, and caused considerable losses to its commerce and industry; but the visitation was not without its salutary fruits, for an improved drainage system, better hospital accommodation, and a purer water-supply have since combined to make it one of the healthiest commercial cities of Europe.

Further details about Hamburg will be found in the following works: O. C. Goederschens, Historische Topographie der Freien und Hansestadt Hamburg (1880); E. H. Wichmann, Heimatkunde von Hamburg (1863); W. Melhop, Historische Topographie der Freien und Hansestadt Hamburg von 1800—1895 (1896); Wall, Hamburgische Gesetze und Verordnungen (1889—1896); and W. von Welle, Das hamburgische Staatsrecht (1901). There are many valuable official publications which may be consulted, among these being: Statistik des Reichsbezirks Hamburg, Subst. Reg.-Oberh. Hamburg (1891); Umgang der Freien und Hansestadt Hamburg; (1893—1895). The yearly Hamburgische Staatskalender; and Jahrbuch der Hamburgischen wissenschaftlichen Anstalten. See also Hamburg und seine Bauten (1890); H. Benneth, Lokalhistorie durch Hamburgische Zeitungen (1867); Ueber die burg Undatierte Kartei; and the regular reports by Sir William Ward, H.B.M.'s consul-general at Hamburg, to whom the author is indebted for great assistance in compiling this article. The history of Hamburg is contained in the works of the Frederician historians, the Hamburger Geschichtsquellen (1841—1860); G. Dehio, Geschichte des Erzbistums Hamburg-Bremen (Berlin, 1877); the Hamburgisches Urkundenbuch (1842), the Hamburgische Chroniken (1852—1861), and the Chronica der Stadt Hamburg bis 1557 of Adam Trautzger (1865), all three edited by M. J. Lappenberg; the Briefsammlung des hamburgischen Superintendenten Joachim Westphal 1530—1755, edited by C. H. W. Sillen (1903); Galliés, Geschichte der Stadt Hamburg (1853—1856); K. Koppmann, Hamburgs Verhältnisse (1888), and Kammereirechnungen der Stadt Hamburg (1889—1894); H. W. C. Hubbe, Beiträge zur Geschichte der Stadt Hamburg (1867); W. R. Reiserouten (1880). The works of the Hamburgischen Geschichts- in Darstellungen aus alter und neuer Zeit (1889); and R. Bollheimer, Zeitäufen der hamburgischen Geschichte (1898).

HAMDANI, in full ABDUHMOMMED UL-HASAN IBN AHMAD IBN YA'QUB UL-HAMDANI (d. 945), Arabian geographer, also known as Ibn al-Jazairi. Little is known of him except that he belonged to a family of Yemen, was held in repute as a grammarian in his time, and compiled on various and astronomical subjects, tables, devoted most of his life to the study of the ancient history and geography of Arabia, and died in prison at Salon's in 945. His Geographical of the Arabian Peninsula (Kitâb Jâzārît al-'Arab) is by far the most important work on the subject. After being used in manuscript by A. Sprenger in his Post- und Reisereisen des Orients (Leipzig, 1864) and further
in his _Alle Geographie Arabiens_ (Bern, 1873), it was edited by D. H. Müller (Leiden, 1884; cf. A. Sprenger’s criticism in _Zeitschrift der deutschen morgenländischen Gesellschaft_, vol. 45, pp. 361-394). Much has also been written on this work by E. Glaser in his various publications on ancient Arabia. The other great work of Hamdānī is the _Iklūd_ (Crown) concerning the genealogies of the Himyarites and the wars of their kings in ten volumes. Of this, part 3, on the citadels and castles of south Arabia, has been edited and annotated by D. H. Müller in _Die Burgen und Schlösser Südostarabien_ (Vienna, 1879-1881).

For other works said to have been written by Hamdānī cf. G. Flügel’s _Die grammatischen Schulen der Araber_ (Leipzig, 1866), pp. 220-221.

---

HAMELIN, François Alphonse (1796-1864), French admiral, was born at Pont-l’Évêque on the 2nd of September 1796. He went to sea with his uncle, J. F. E. Hamelin, in the "Vénus" frigate in 1806 as cabin boy. The "Vénus" was part of the French squadron in the Indian Ocean, and young Hamelin had an opportunity of seeing much active service. He, in company with another and a smaller vessel, captured the English frigate "Ceylon" in 1808, but was immediately afterwards captured herself by the "Boadicea," under Commodore Rowley (1765-1842). Young Hamelin was a prisoner of war for a short time. He returned to France in 1811. On the fall of the Empire he had better fortune than most of the Napoleonic officers who were turned ashore. In 1821 he became lieutenant, and in 1823 took part in the French expedition under the duke of Angoulême into Spain. In 1828 he was appointed captain of the "Actéon," and was engaged till 1836 in the coast of Algiers and in the conquest of the town and country. His first command as flag officer was in the Pacific, where he showed much tact during the dispute over the Marquesas Islands with England in 1844. He was promoted vice-admiral in 1848. During the Crimean War he commanded in the Black Sea, and co-operated with Admiral Dundas in the bombardment of Sevastopol 17th of October 1854. His relations with his English colleague were not very cordial. On the 7th of December 1854 he was promoted admiral. Shortly afterwards he was recalled to France, and was named minister of marine. His administration of this department was remarkable for the expeditions to Italy and China organized under his directions; but it was more even notable for the energy shown in adopting and developing the use of armour. The launch of the "Gloire" in 1859 set the example of constructing sea-going ironclads. The first English ironclad, the "Warrior," was designed as an answer to the "Gloire." When Napoleon III. made his first concession to Liberal opposition, Admiral Hamelin was one of the ministers sacrificed. He held no further command, and died on the 3rd of January 1864.

---

HAMELIN, Hermann, 11th Prince of Germany, in the Prussian province of Hanover, at the confluence of the Weser and Hamel, 33 m. S.W. of Hanover, on the line to Altenhechen, which here effects a junction with railways to Löhne and Brunswick. Pop. (1905) 20,736. It has a venerable appearance and has many interesting and picturesque houses. The chief public interests of business are the mines, dedicated to St Boniface and restored in 1870-1875; the town hall; the so-called Rattenfängerhaus (rattcacher’s house) with mural frescoes illustrating the legend (see below); and the Hochzeitshaus (wedding house) with beautiful gables. There are classical, modern and commercial schools. The principal industries are the manufacture of paper, leather, chemicals and tobacco, sugar refining, shipbuilding and salmon fishing. By the steamboats on the Weser there is communication with Karlsfahnen and Minden. In order to avoid the dangerous part of the river near the town a channel was cut in 1734, the repairing and deepening of which, begun in 1806, was completed in 1873. The Weser is here crossed by an iron suspension bridge 830 ft. in length, supported by a pier erected on an island in the middle of the river.

The older name of Hamelin was Hameloe or Hamelowe, and the town owes its origin to an abbey. It existed as a town as early as the 11th century, and in 1259 it was sold by the abbots of Fulda to the bishop of Minden, afterwards passing under the protection of the dukes of Brunswick. About 1540 the Reformation gained an entrance into the town, which was taken by both parties during the Thirty Years’ War. In 1757 it capitulated to the French, who, however, vacated it in the following year. Its fortifications were strengthened in 1766 by the erection of Fort George, on an eminence to the west of the town, across the river. In 1803 the captain of this Hanoverian army in 1803 Hameln fell into the hands of the French; it was retaken by the Prussians in 1806, but, after the battle of Jena, again passed to the French, who dismantled the fortifications and incorporated the town in the kingdom of Westphalia. In 1814 it again became Hanoverian, but in 1866 fell with that kingdom to Prussia.

_Legend of the Pied Piper._—Hamelin is famed as the scene of the myth of the piper of Hameln. According to the legend, the town in the year 1284 was infested by a terrible plague of rats. One day there appeared upon the scene a piper clad in a fantastic suit, who offered for a certain sum of money to charm all the vermin into the Weser. His conditions were agreed to, but after he had fulfilled his promise the inhabitants, on the ground that he was a sorcerer, declined to fulfil their part of the bargain, whereupon on the 20th of June he reappeared in the streets of the town, and putting his pipe to his lips began a soft and curious strain. This drew all the children after him and he led them out of the town to the Koppelberg hill, in the side of which a door suddenly opened, by which he entered and the children after him, all but one who was lame and could not follow fast enough to reach the door before it shut again. Some trace the origin of the legend to the Children’s War of 1277; others to an abduction of children; and others to a dancing mania which seized upon some of the young people of Hameln who left the town on a mad pilgrimage from which they never returned. For a considerable time the town dated its public documents from the event. The story is the subject of a poem by Robert Browning, and also of one by Julius Wolff. Curious evidence that the story rests on a basis of truth is given by the fact that the Koppelberg is not one of the imposing hills by which Hamelin is surrounded, but no more than a slight elevation of the ground, barely high enough to hide the children from view as they left the town.

See C. Langlotz, _Geschichte der Stadt Hameln_ (Hameln, 1888 fol.); A. Sprenger, _Geschichte der Stadt Hameln_ (1861); O. Meinardus, _Der historische Kern der Kattenfängerage_ (Hameln, 1882); Jostes, _Der Katenfänger von Hameln_ (Hameln, 1853); and S. Baring-Gould, _Curious Myths of the Middle Ages_ (1868).

HAMERLING, Robert (1830-1886), Austrian poet, was born at Kirchenberg-am-Walde in Lower Austria, on the 24th of March 1830, of humble parentage. He early displayed a genius for poetry and his youthful attempts at drama excited the admiration of his schoolfellows, who induced admiring old men to subscribe to their assistance young Hamerling was enabled to attend the gymnasium in Vienna and subsequently the university. In 1848 he joined the student’s legion, which played so conspicuous a part in the revolutions of the capital, and in 1849 shared in the defence of Vienna against the imperialist troops of Prince Windischgrätz, and after the collapse of the revolutionary movement he was obliged to hide for a long time to escape arrest. For the next few years he diligently pursued his studies in natural science and philosophy, and in 1855 was appointed master at the gymnasium at Trieste. For many years he battled with ill-health, and in 1866 retired on a pension, which in acknowledgment of his literary labours was increased by the government to a sum sufficient to enable him to live without care until his death at his villa in Stiftungtal near Graz, on the 13th of July 1889. Hamerling was one of the most remarkable of the poets of the modern Austrian school; his most popular poem, _Ahasver in Rom_ (1866), of which the emperor Nero is the central figure, shows at its best the author’s brilliant talent for description. Among his other works may be mentioned _Venus im Exil_ (1858); _Der König von Sien_ (1860), which is generally regarded as his masterpiece; _Die sieben Todsünden_ (1872); _Blätter im Winde_ (1887); _Homunculus_ (1888); _Amor und
Psyche (1882). His novel, Aspasia (1876) gives a finely-drawn description of the Periclean age, but his tragedy Danton and Robespierre is somewhat stilted, showing that Hamerton's genius, though rich in imagination, was ill-suited for the realistic presentation of character.

A popular edition of Hamerton's works in four volumes was published by M. M. Rabenlechner (Hamburg, 1900). For the poet's life, see his autobiographical writings, Stimmungen (Leipzig, 1889); also M. M. Rabenlechner, Hamerton, sein Leben und seine Werke, i. (Hamburg, 1896); a short biography by the same (Dresden, 1901); R. H. Kleinnert, R. Hamerton, ein Dichter der Schönhelt (Hamburg, 1886); A. Polenz, Hamerton, sein Wesen und Wirken (Hamburg, 1890).

HAMERTON, PHILIP GILBERT (1834-1894), English artist and author, was born at Laneside, near Shaw, close to Oldham, on the 10th of September 1834. His mother died at his birth, and having lost his father ten years afterwards, he was educated privately under the direction of his guardians. His first literary attempt, a volume of poems, proving unsuccessful, he devoted himself for a time entirely to landscape painting, encamping out of doors in the Highlands, where he explored with delight the isle of Skye.

Discovering after a time that his qualifications were rather those of an art critic than of a painter he removed to the neighbourhood of his wife's relatives in France, where he produced his Painter's Camp in the Highlands (1863), which obtained a great success and prepared the way for his standard work on Etching and Etchers (1866). In the following year he published a book, entitled Contemporary French Painters, and in 1868 a continuation, Painting in France after the Decline of Classicism. He had meanwhile become art critic on the Saturday Review, and from the burden it laid upon him of frequent visits to England, he did not long retain. He proceeded (1879) to establish an art journal of his own, The Portfolio, a monthly periodical, each number of which consisted of a monograph upon some artist or group of artists, frequently written and always edited by him. The discontinuance of his active work as a painter gave him time for more general literary composition, and he successively produced The Intellectual Life (1875), perhaps the best known and most valuable of his writings; Round my House (1876), notes on French society by a resident; and Modern Frenchmen (1879), admirable short biographies. He also wrote two novels upon which he settled with his wife, a French lady, in 1858.

In 1884 Human Intercourse, another valuable volume of essays, was published, and shortly afterwards Hamerton began to write his autobiography, which he brought down to 1885. In 1882 he issued a finely illustrated work on the technique of the great masters of various arts, under the title of The Graphic Arts, and three years later another splendidly illustrated volume, Landscape, which traces the influence of landscape upon the mind of man. His last books were: Portfolio Papers (1886) and French and English (1886). In 1891 he removed to the neighbourhood of Paris, which he died suddenly on the 4th of November 1894, occupied to the last with his labours on The Portfolio and other writings on art.

In 1896 was published Philip Gilbert Hamerton: an Autobiography, 1834-1881; and a Memoir by his Wife, 1835-1894.

HAM, a town in Chinese Turkestan, otherwise called Kamul, Komul or Kamul, situated on the southern slopes of the Tian Shan mountains, and on the northern verge of the Great Gobi desert, in 42° 48' N., 93° 28' E., at a height above sea-level of 3150 ft. The town is first mentioned in Chinese history in the 1st century, under the name Kao-ulu, and is supposed to have been founded 1000 lǐ north of the fortress Yu-men-kuan, and to be the key to the western countries. This evidently referred to its advantageous position, lying as it did in a fertile tract, at the point of convergence of two main routes running north and south of the Tian-Shan and connecting China with the west. It was taken by the Chinese in A.D. 73 from the Hsiian (the ancient inhabitants of Mongolia), and made a military station. It next fell into the hands of the Uighurs or Eastern Turks, who made it one of their chief towns and held it for several centuries, and whose descendants are said to live there now. From the 7th to the 11th century I-wu-lu is said to have borne the name of Igu or I-chu, under the former of which names it is spoken of by the Chinese pilgrim, Hsiian tsang, who passed through it in the 7th century. The name Hami is first met in the Chinese Yüan-shi or "History of the Mongol Dynasty," but the name more generally used there is Homi-li or Komi-li. Marco Polo, describing it apparently from hearsay, calls it Camul, and speaks of it as a fruitful place inhabited by a Buddhist people of idolatrous and wanton habits. It was visited in 1341 by Giovanni de Marignoli, who baptized a number of both sexes there, and by the Jesuits, in 1704, under the leadership of Shahi Suhuk (1420), who found a magnificent mosque and a convent of dervishes, in juxtaposition with a fine Buddhist temple. Hadji Mahommend (Ramusio's friend) speaks of Kamul as being in his time (c. 1550) the first Mahomedan city met with in travelling from China. When Benedict Goes travelled through the country at the beginning of the 17th century, the power of the king Mahommend Khan of Kashgar extended over nearly the whole country at the base of the Tian Shan to the Chinese frontier, including Kamil. It fell under the sway of the Chinese in 1720, was lost to them in 1865 during the great Mahomedan rebellion, and the trade route through it was consequently closed, but was regained in 1873. Owing to its commanding position on the principal route to the west, and its exceptional fertility, it has very frequently changed hands in the wars between China and her western neighbours. Hami is now a small town of about 6000 inhabitants, and is a busy trading centre. The Mahomedan population consists of immigrants from Kashgar, Bokhara and Samarkand, and of descendants of the Uighurs.

HAMILCAR BARCA, or BARCAS (Heb. barak "lightning"), Carthaginian general and statesman, father of Hannibal, was born soon after 270 B.C. He distinguished himself during the First Punic War in 247, when he took over the chief command in Sicily, which at this time was almost entirely in the hands of the Romans. Landing suddenly on the north-west of the island with a small mercenary force he seized a strong position on Mt. Erice (Monte Pellegrino, near Palermo), and not only maintained himself against all attacks, but carried his raids as far as the coast of south Italy. In 244 he transferred his army to a similar position on the slopes of Mt. Erzys (Monte San Giuliano), from which he was able to lend support to the besieged garrison in the neighbouring town of Drepanum (Trapani). By a provision of the peace of 241 Hamilcar's unbeaten force was allowed to depart from Sicily without any token of submission. On returning to Africa his troops, which had been kept together only by his personal authority and by the promise of good pay, broke out into open mutiny when their rewards were withheld by Hamilcar's opponents among the governing aristocracy. The serious danger into which Carthage was brought by the failure of the aristocratic generals was averted by Hamilcar, whom the government in this crisis could not but reinstate. By the power of his personal influence among the mercenaries and the surrounding African peoples, and by superior strategy, he speedily crushed the revolt (237). After this success Hamilcar enjoyed such influence among the popular and patriotic party that his opponents could not prevent him being raised to a virtual dictatorship. After recruiting and training a new army in some Numidian forays he led on his own responsibility an expedition into Spain, where he hoped to gain a new empire to compensate Carthage for the loss of Sicily and Sardania, and to serve as a basis for a campaign of vengeance against the Romans (229). In eight years by virtue of arms and diplomacy he secured an extensive territory in Spain, but his premature death in battle (228) prevented him from completing the conquest. Hamilcar stood out far above the Carthaginians of his age in military and diplomatic skill and in strength of patriotism; in these qualities he was surpassed only by his son Hannibal, whom he had imbued with his own deep hatred of Rome and trained to be his successor in the conflict.

This Hamilcar has been confused with another general who succeeded to the command of the Carthaginians in the First Punic War, and after successes at Tharros and Drepanum was defeated at
Economus (265 B.C.). Subsequently, apart from unskilful operations against Regulus, nothing is certainly known of him. For others of the name see Carthage, Sicily, Smith's Classical Dictionary. So far as the name is concerned, Miletus is perhaps the same as Melik, the Tyrian god.

See Polybius i.iii; Cornelius Nepos, Vita Hamilcaris; Appian, Res Hispanicae, chs. 4, 5; Diodorus, Esoporia, xxiv, xxx; O. Meltzer, Geschichte der Karthager (Berlin, 1877), p. 434. (M. O. B. C.)

HAMILTON, the name of a famous Scottish family. Chief among the legends still clinging to this important family is that which gives a descent from the house of Beaumont, a branch of which is stated to have held the manor of Hamilton in Leicestershire; and it is argued that the three cinquefoils of the Hamilton shield bear some resemblance to the single cinquefoil of the Beaumonts. In face of this it has been recently shown that the single cinquefoil was also borne by the Umfravilles of Northumberland, who appear to have owned a place called Hamilton in that county. It may be pointed out that Simon de Montfort, the great earl of Leicester, in whose veins flowed the blood of the Beaumonts, obtained about 1245 the warship of Gilbert de Umfraville, second earl of Angus, and it is conceivable that this name Gilbert may somehow be responsible for the legend of the Beaumont descent, seeing that the first authentic ancestor of the Hamiltons is one Walter FitzGilbert. He first appears in 1294-1295 as one of the witnesses to a charter by James, the high steward of Scotland, to the monks of Paisley; and in 1296 he is styled as a witness of "Hameldon." Who this Gilbert of "Hameldon" may have been is uncertain, "but the fact must be faced," Mr John Anderson points out (Scots Peerage, iv. 340) "that in a charter of the 12th of December 1272 by Thomas of Crayne or Craigie to the monks of Paisley of his church of Craigie in Kyle, there appears as witness a certain 'Gilbert de Hameldun clericus,' whose name occurs along with the local clergy of Inverkip, Blackhall, Paisley and Dunoon. He was therefore probably also a cleric of the same neighbourhood, and it is significant that his son, FitzGilbert, appears in 1304, and in 1296 is described as son of Gilbert de Hameldon. . . ." Walter FitzGilbert took some part in the affairs of his time. At first he joined the English party but after Bannockburn went over to Bruce, was knighted and subsequently received the barony of Cadzow. His younger son John was father of Alexander Hamilton who acquired the lands of Innerwick by marriage, and from him descended a certain Thomas Hamilton, who acquired the lands of Priestfield early in the 16th century. Another Thomas, grandson of this last, who had with others of his house followed Queen Mary and was made a "man of the household of Mary," was executed in 1570 under the policy of deposing Mary, Queen of Scots. This Thomas was a man of little which was afterwards marquis, was in 1656 to William Douglas, earl of Selkirk. The history of the descendants of this marriage belongs to the great house of Douglas, the 7th duke of Hamilton becoming the male representative and chief of the house of Douglas, earls of Angus.

The above mentioned Claud Hamilton, who with his brother, the 3rd marquess, was taken as a prisoner in the cause of Queen Mary, was created a lord of parliament as Lord Paisley in 1587. He had five sons, of whom three settled in Ireland, Sir Claud being ancestor of the Hamiltons of Beltrim and Sir Frederick, distinguished in early life in the Swedish wars, being ancestor of the viscounts Boydne.

James, the eldest son of Lord Paisley, found favour with James VI. and was created in 1603 Lord of Abercorn, and three years later was advanced in the peerage as earl of Abercorn and lord of Paisley, Hamilton, Mountcastell and Kilpatrick. His eldest son James, and earl of Abercorn, eventually heir male of the house of Hamilton and successor to the dukedom of Châtellerault, was created in his father's lifetime lord of Strabane in Ireland, but he resigned this title in 1633 in favour of his brother Claud, whose grandson, Claud, 5th Lord Strabane, succeeded
eventually as 4th earl of Abercorn. This earl, taking the side of James II., was with him in Ireland, his estate and title being afterwards forfeited, while his kinsman Gustavus Hamilton, afterwards first Lord Boyne, raised several regiments and William III., and greatly distinguished himself in the service of that monarch. His brother Charles, 6th earl of Abercorn, who obtained a reversal of the attainder, died without issue surviving in 1701 when the titles passed to his kinsman James Hamilton, grandson of Sir George Hamilton of Donalong in Ireland and great-grandson of the first earl. This branch, most faithful to the house of Stuart, counted among its many members distinguished in military annals Count Anthony Hamilton, author of the *Mémoires du comte de Gramont* and brother of "la belle Hamilton." James, 6th earl of Abercorn (whose brother William was ancestor of Hamilton of the Mount, baronet), was a partizan of William III., and obtained in 1701 the additional Irish titles of lord of Mountcastle and viscount of Strabane.

The 8th earl of Abercorn, who was summoned to the Irish house of peers in his father's lifetime as Lord Mountcastle, was created a peer of Great Britain in 1760 as Viscount Hamilton of Hamilton in Leicestershire, and renewed the family's connexion with Scotland by repurchasing the barony of Duddingston and later the lordship of Paisley. His nephew and successor was once Lord Hamilton of Abercorn in 1790, and was father of James, 1st duke of Abercorn.

See the article Hamilton and other articles on the different branches of the family (e.g. Haddington and Belhaven) in Sir J. B. Paul's *History of Sir R. Douglas's Peerage of Scotland*; and also G. Marshall, *Guide to Heraldry and Genealogy*.

**HAMILTON, MARQUESSES AND DUKES OF.** The holders of these titles descended from Sir James Hamilton of Cadzow, who was made an hereditary lord of parliament in 1445, his lands and baronies at the same time being erected into the "lordship" of Hamilton. His first wife Euphemia, widow of the 5th earl of Douglas, died in 1468, and probably early in 1474 he married Mary, daughter of King James II. and widow of Thomas Boyd, earl of Arran; the consequent nearness of the Hamiltons to the Scottish crown gave them very great weight in Scottish affairs. The first Lord Hamilton has been frequently confused with his father, James Hamilton of Cadzow, who was one of the hostages in England for the payment of James I.'s ransom, and is sometimes represented as surviving until 1451 or even 1479, whereas he certainly died, according to evidence brought forward by J. Anderson in *The Scots Peerage*, before May 1441. James, elder son of the 1st lord, was himself earl of Arran and Mary, was created earl of Arran in 1503; and his son James, who was regent of Scotland from 1542 to 1554, received in February 1549 a grant of the duchy of Châtellerault in Poitou.

**John, 1st marquess of Hamilton (c. 1542-1604),** third son of James Hamilton, 2nd earl of Arran (c. 1528-1562) and duke of Châtellerault, was given the abbey of Arbroath in 1551. In politics he was largely under the influence of his energetic and unscrupulous younger brother Claud, afterwards Baron Paisley (c. 1543-1622), ancestor of the dukes of Abercorn. The brothers were the real heads of the house of Hamilton, their elder brother Arran being insane. At first hostile to Mary, they later became her devoted partisans. Their uncle, John Hamilton, archbishop of St Andrews, natural son of the 1st earl of Arran, was restored to his consistorial jurisdiction by Mary in 1566, and in May of the next year he divorced Bothwell from his wife. Lord Claud met Mary on her escape from Lochleven and escorted her to Hamilton palace. John appears to have been in France in 1568 when the battle of Langside was fought, and it was probably Claud who commanded Mary's vanguard in the battle. With others of the queen's party they were forfeited by the parliament and sought their revenge on the regent Murray. Although the Hamiltons disavowed all connexion with Murray's murderer, James Hamilton of Bothwellhaugh, he had been provided with horse and weapons by the abbot of Arbroath, and it was at Hamilton that he sought refuge after the deed. Archbishop Hamilton was hanged at Stirling in 1571 for alleged complicity in the murder of Darnley, and is said to have admitted that he was a party to the murder of Murray. At the pacification of Perth in 1573 the Hamiltons abandoned Mary's cause, and a reconciliation with the Douglas was arranged by Lord John's marriage with Margaret, daughter of the 7th Lord Glamis, a cousin of the regent Morton. Sir William Douglas of Lochleven, however, persistently sought his life in revenge for the murder of Murray until, on his refusal to keep the peace, he was imprisoned. On the uncertain evidence extracted from the assassin by torture, the Hamiltons had been credited with a share in the murder of the regent Lennox in 1571. In 1579 proceedings against them for these two crimes were resumed, and when they escaped to England their lands and titles were seized by their political enemies the Earls of Bothwell and Hertford. John Hamilton presently dissociated himself from the policy of his brother Claud, who continued to plot for Spanish intervention on behalf of Mary; and Catholic plotters are even said to have suggested his murder to procure the succession of his brother. Hamilton had at one time been credited with the hope of marrying Mary; his desires now centred on the peaceful enjoyment of his estates. With other Scottish exiles he crossed the border in 1585 and marched on Stirling; he was admitted on the 4th of November and formally reconciled with James VI., with whom he had been previously domiciled for years. When James Hamilton was reconciled to Scotland in 1586, and the abbey of Paisley was erected into a temporal barony in his favour in 1587. Much of his later years was spent in strict retirement, his son being authorized to act for him in 1598. John was created marquess of Hamilton and Lord Evan in 1599, and died on the 6th of April 1604.

His eldest surviving son James, 2nd marquess of Hamilton (c. 1589-1623), was created baron of Innerdale and earl of Cambridge in the peerage of England in 1619, and these honours descended to his son James, who in 1643 was created duke of Hamilton (c. 1589-1643), and succeeded to the dukedom on his brother's execution in 1649. He was created earl of Lanark in 1639, and in the next year became secretary of state in Scotland. Arrested at Oxford by the king's orders in 1643 for "concurrency" with Hamilton, he effected his escape and was temporarily reconciled with the Presbyterian party. He was sent by the Scottish committee of estates to treat with Charles I. at Newcastle in 1646, when he sought in vain to persuade the king to consent to the establishment of Presbyterianism in England. On the 26th of September 1647 he signed, on behalf of the Scots the treaty with Charles's queen, Mary of Modena, "Engrossed in the act of pacification and helped to organize the second Civil War. In 1648 he fled to Holland, his succession in the next year to his brother's dukedom making him an important personage among the Royalist exiles. He returned to Scotland with Prince Charles in 1650, but, finding a reconciliation with Argyll impossible, he refused to prejudice Charles's cause by pushing his claims, and lived in retirement chiefly until the Scottish invasion of England, when he acted as colonel of a body of his dependants. He died on the 12th of September 1651 from the effects of wounds received at Worcester. He left no male heirs, and the title devolved on the 1st duke's eldest surviving daughter Anne, duchess of Hamilton in her own right.

Anne married in 1656 William Douglas, earl of Selkirk (1635-1694), who was created duke of Hamilton in 1660 on his wife's petition, receiving also several of the other Hamilton peerages, but for his life only. The Hamilton estates had been declared forfeit by Cromwell, and he himself had been fined £1000. He supported Lauderdale in the early stages of his Scottish policy, in which he adopted a moderate attitude towards the Presbyterian, but the two were soon alienated, through the influence of the court, whose financial agent, William of Douay, supported his petitions. The earl of Lauderdale, who spent much time at Hamilton Palace in arranging the Hamilton papers. With other Scottish noblemen who resisted Lauderdale's measures Hamilton was twice summoned to London to present his case at court, but without obtaining any result. He was dismissed from the privy council in 1676, and on a subsequent visit to London Charles refused to receive him. On the accession
of James II. He received numerous honours, but he was one of the first to enter into communication with the prince of Orange. He presided over the convention of Edinburgh, summoned at his request, which offered the Scottish crown to William and Mary in March 1689. His death took place at Holyrood on the 18th of April 1694. His wife survived until 1716.

James Douglas, 4th duke of Hamilton (1668–1712), oldest son of James and his first wife, was created peer of Scotland in 1698, and at the accession of Queen Anne he was regarded as leader of the Scottish national party. He was an opponent of the union with England, but his lack of decision rendered his political conduct ineffective. He was created duke of Brandon in the peerage of Great Britain in 1711; and on the 15th of November in the following year he fought the celebrated duel with Charles Lord Mohun, narrated in Thackeray's Esmond, in which both the principals were killed. His son, James (1703–1743), became the 5th duke in 1712. His grandson, James, 6th duke of Hamilton and Brandon (1724–1758), married the famous beauty, Elizabeth Gunning, afterwards duchess of Argyll. James George, 7th duke (1753–1769), became head of the house of Douglas on the death in 1761 of Archibald, duke of Douglas, whose titles but not his estates then devolved on the duke of Hamilton as heir-male. Archibald’s brother Douglas (1756–1799) was the 8th duke, and when he died childless the titles passed to his uncle Archibald (1740–1819). His son, Archibald, 9th duke (1757–1832), who as marquess of Douglas was a great collector and connoisseur of works of art and books, was knighted for his collections in 1816 and in 1832, was ambassador at St Petersburg in 1866–1897. His sister, Lady Anne Hamilton, was lady-in-waiting and a faithful friend to Queen Caroline, wife of George IV; she did not write the Secret History of the Court of England . . . (1832) to which her name was attached.

William Alexander, 11th duke of Hamilton (1811–1863), married Princess Marie Amélie, daughter of Charles, grand-duke of Baden, and, on her mother’s side, a cousin of Napoleon III. The title of duke of Châtellerault, granted to his remote ancestor in 1548, and claimed at different times by various branches of the Hamilton family, was conferred on the 11th duke’s son, William Alexander, 12th duke of Hamilton (1845–1895), by the emperor of the French in 1864. His sister, Lady Mary Douglas-Hamilton, married, in 1869 Albert, prince of Monaco, but their marriage was declared invalid in 1880. She subsequently married Count Tassiolo Festetics, a Hungarian noble. The 12th duke left no male issue and was succeeded in 1895 by his kinsman, Alfred Douglas, a descendant of the 4th duke. Claud Hamilton, 1st Baron Paisley, brother of the 1st marquess of Hamilton, was, as mentioned above, ancestor of the Abercorn branch of the Hamilton family. His son, I. Anderson in Sir J. B. Paul’s edition of the Scots Peerage, vol. iv. (1907).

HAMILTON, ALEXANDER (1757–1804), American statesman and economist, was born, as a British subject, on the island of Nevis in the West Indies on the 11th of January 1757. He came of good family on both sides. His father, James Hamilton, a Scottish merchant of St Christopher, was a younger son of Alexander Hamilton of Grange, Lanarkshire, by Elizabeth, daughter of Sir R. Pollock. His mother, Rachael Fawcett (Faucette), of French Huguenot descent, married when very young a Danish proprietor of St Croix, John Michael Levine, with whom she lived unhappily and whom she soon left, subsequently living with James Hamilton; her husband procured a divorce in 1759, but the court forbade her remarriage. Such unions as hers with James Hamilton were long not uncommon in the West Indies. By her James Hamilton had two sons, Alexander and James. Business misfortunes having caused his father’s bankruptcy, and his mother dying in 1768, young Alexander, as he was then, had to administer his own affairs at St Croix, where, in his twelfth year, he entered the counting-house of Nicholas Cruger. Shortly afterward Mr Cruger, going abroad, left the boy in charge of the business. The extraordinary specimens we possess of his mercantile correspondence and friendly letters, written at this time, attest an astonishing poise and maturity of mind, and self-conscious ambition. His opportunities for regular schooling must have been very scant; but he had cultivated friends who discerned his talents and encouraged their development, and he early formed the habits of wide reading and industrious study that were to persist through his life. An accomplishment later of great service to Hamilton, common enough in the Antilles, but very rare in the English continental colonies, was a familiar command of French. In 1772 some friends, impressed by a description by him of the terrible West Indian hurricane in that year, made it possible for him to go to New York to complete his education. Arriving in the autumn of 1772, he prepared for college at Elizabethtown, N.J., and in 1774 entered King’s College (now Columbia University) in New York City. His studies, however, were interrupted by the War of American Independence. His political leanings were strongly confirmed, to which reason had already led him, that he should cast in his fortunes with the colonists. Into their cause he threw himself with ardor. In 1774–1775 he wrote two influential anonymous pamphlets, which were attributed to John Jay; they show remarkable maturity and controversial ability, and rank high among the political arguments of the time. He organized an artillery company, was awarded its captainship on examination, won the interest of Nathanael Greene and Washington by the proficiency and bravery he displayed in the field, and was commissioned a lieutenant-colonel in March 1777 with the rank of lieutenant-colonel, and during four years served as his private secretary and confidential aide. The important duties with which he was entrusted attested Washington’s entire confidence in his abilities and character; then and afterwards, indeed, reciprocal confidence and respect took the place, in their relations, of personal attachment. But Hamilton was ambitious for military glory—it was an ambition he never lost; he became impatient of detention in what he regarded as a position of unpleasant dependence, and (1782) determined to resign his command. He secured a field command, through Washington, and won laurels at Yorktown, where he led the American column in the

1These facts were first definitely determined by Mrs Gertrude Atherton from the Danish Archives in Denmark and the West Indies; see article in North American Review, Aug. 1902, vol. 157, p. 217, and preface to her A Few of Hamilton’s Letters (New York, 1903).

2These were written in answer to the widely read pamphlets published over the nom de plume of "A Westchester Farmer," and now known to have been written by Samuel Seabury (q.v.). Hamilton’s pamphlets were entitled "A Full Vindication of the Measures of the Congress from the Calumnies of their Enemies," and "The Farmer Refuted." Concerning them George Ticknor Curtis (Constitutional History of the United States, i. 274) has said, "There are, displayed in these papers a power of reasoning and sarcasm, a knowledge of the principles of government and of the English constitution, and a grasp of the merits of the whole controversy, that would have done honour to any man at any age. To say that they evince precocity of intellect gives no idea of their main characteristics. They show great maturity; more regard for the maturity than has ever been published by any other person, at so early an age, in the same degree of thought."

3George Bancroft was the first to point out that there is small evidence that Hamilton ever really appreciated Washington’s great qualities; but on the score of personal and Federalist indebtedness he left explicit recognition.

For Hamilton’s letter to General Schuyler on this episode—one of his most important letters, in some ways, that he ever wrote —see the Works, ix. 232 (8. 33).
final assault on the British works. In 1780 he married Elizabeth, daughter of General Philip Schuyler, and thus became allied with one of the most distinguished families in New York. He made use of some of her not inconsiderable efforts upon which his fame principally rests. In letters of 1779-1786 he correctly diagnoses the ills of the Confederation, and suggests with admirable prescience the necessity of centralization in its governmental powers; he was, indeed, one of the first, if not to conceive, at least to suggest adequate checks on the anarchic tendencies of the time. After a year's service in Congress in 1782-1783, in which he experienced the futility of endeavouring to attain through that decrepid body the ends he sought, he settled down to legal practice in New York. The Government Act of 1786 gave Hamilton an opportunity. A delegate from New York, he supported Madison in inducing the Convention to exceed its delegated powers and summon the Federal Convention of 1787 at Philadelphia (himself drafting the call); he secured a place on the New York delegation; and, when his anti-Federal colleagues withdrew from the Convention, he signed the Constitution for his state. So long as his colleagues were present his own vote was useless, and he abstained himself for some time from the debates after making one remarkable speech (June 18th, 1787). In the next phase of the government, he was clearly the strongest in the world. Though fully conscious that monarchy in America was impossible, he wished to obtain the next best solution in an aristocratic, strongly centralized, coercive, but representative union, with devices to give weight to the influence of class and property. His plan had no chance of success; but though unable to obtain what he wished, he used his great talents to secure the adoption of the Constitution.

To this struggle was due the greatest of his writings, and the greatest individual contribution to the adoption of the new government, The Federalist, which remains a classic commentary on American Constitutional law and the principles of government, and of which Guizot said that "in the application of elementary principles of government to practical administration it was the greatest work known to him. Its inception, and much more than half its contents were Hamilton's (the rest Madison's and Jay's). Sheer will and reasoning could hardly be more brilliant.1

1 Especially the letter of September 1789 to James Duane, Works, i. 213 (1: 203); also the "Capitalist" papers of 1781.

2 His most famous case at this time (Rutgers v. Waddington) was one that well illustrated his moral courage. Under a Trespass Law, "of New York," an English officer was made to apologize and an assault charge against one Joshua Waddington, a Loyalist, who during the war of American Independence, while New York was occupied by the British, had made and occupied some of the most valuable real estate in New York. In the trial, Waddington, Hamilton, who advocated a conciliatory treatment of the Loyalists, represented Waddington, who won the case, decided in 1790.

3 As Mr Oliver points out (Alexander Hamilton, p. 156), Hamilton's idea of the British constitution was not a correct picture of the British constitution in 1787, and still less of that of the 20th century. "What he had in mind was the British constitution as George III. had tried to make it." Hamilton's ideal was an elective monarchy, and his guiding principle a proper balance of authority.

4 Briefly, he proposed a governor and two chambers—an Assembly elected by the people for three years, and a Senate—the governor and senate holding office for life or during good behaviour, and chosen, through electors, by voters qualified by property; the governor having a negative to any law, a treaty, and the principles of government, and to be appointed by the federal government; the federal government to control all militia. See Works, i. 347 (i: 331); and cf. his correspondence, which is scanty, pausing in later years, notably x. 446, 431, 329 (8: 606, 656, 517), and references below.

5 Nearly all the papers in The Federalist first appeared (between October, 1787 and April, 1788) in New York journals, over the signature of "Publius." James Madison, in his "Notes on the Constitution," i. 241, said: "There is no work on the subject of the Constitution in Congress, and on republican and federal government generally, that deserves to be more thoroughly studied. I know not indeed of any work on the principles of government that can be obtainable, which contain so much value, to this small and unpretending volume. It is equally admirable in the depth of its wisdom, the comprehensiveness of its views, the sagacity of its reflections, and the tearlessness, patriotism,  

7 Hamilton and effectively exhibited that they were by Hamilton in the New York convention of 1788, whose vote he won, against the greatest odds, for the ratification of the Constitution. It was the judgment of Chancellor James Kent, of the practice of which can hardly be disputed, that "all the documentary proof and the current observation of the time lead us to the conclusion that he surpassed all his contemporaries in his exertions to create, recommend, adopt and defend the Constitution of the United States."

When the new government was inaugurated, Hamilton became secretary of the treasury in Washington's cabinet. Congress immediately referred to him a press of queries and problems, and there came from his pen a succession of papers that have left the strongest imprint in its administration. In the early years of the national government—two reports on public credit, upholding an ideal of national honour higher than the prevalent popular principles; a report on manufactures, advocating their encouragement (e.g. by bounties paid from surplus revenues amassed by tariff duties)—a famous report that has served ever since as a storehouse of arguments for a national protective policy; a report favouring the establishment of a national bank, the argument being based on the doctrine of "implied powers," that the government, for its purposes, has a right to exercise, and the application that Congress may do anything that can be made, through the medium of money, to subserve the "general welfare" of the United States—doctrines that, through judicial interpretation, have revolutionized the Constitution; and, finally, a vast mass of detailed work by order and efficiency were given to the national finances. In 1793 he put to confusion his opponents who had brought about a congressional investigation of his official accounts. The success of his financial measures was immediate and remarkable. They did not, as is often but loosely said, save the economic prosperity; but they did prop it, in an all-important field, with order, hope and confidence. His ultimate purpose was always the strengthening of the union; but before particularizing his political theories, and the political import of his financial measures, the remaining events of his life may be traced.

His activity in the cabinet was by no means confined to the finances. He regarded himself, apparently, as premier, and sometimes overstepped the limits of his office in interfering with other departments. The heterogeneous character of the duties placed upon his department by Congress seemed in fact to merge this department, as it was then conceived, in the one that was in fact predominant with Washington (so far as any man could have predominant influence). Thus it happens that in foreign affairs, whatever credit properly belongs to the Federalists as a party (see also the article FEDERALIST PARTY for the adoption of that principle of neutrality which became the traditional policy of the United States must be regarded as largely due to Hamilton. But allowance must be made for the mere advantage of initiative which belonged to any party that organized the government—the differences between Hamilton and Jefferson in this question of neutrality, being almost purely factitious. On domestic policy their differences were vital, candour, simplicity, and elegance, with which its truths are uttered and recommended.

The first position was offered first to Robert Morris, who declined it, expressing the opinion that Hamilton was the man best fitted to meet its problems.

Hamilton's Report on Manufactures (1791) by itself entitles him to a place among the great economists. It was the first great revolt from Adam Smith, and on whose Wealth of Nations (1776) he is said to have already written a commentary which is lost. In his criticism on Adam Smith, and his arguments for a system of moderate protective duties associated with the deliberate policy of promoting national interests, his work was the inspiration of Friedrich List, and so the foundation of the economic system of Germany in a later day, and again, still later, of the policy of Tariff Reform and Colonial Preference in England, as advocated by Mr Chamberlain and his supporters. See the detailed account given in the article PROTECTION.

That, while Jefferson hated British aristocracy and sympathized with French democracy, Hamilton hated French democracy and sympathized with British aristocracy and order; but
and in their conflicts over Hamilton's financial measures they organized, on the basis of varying tenets and ideals which have never ceased to conflict in American politics, the two great parties of Federalists and Democrats (or Democratic-Republicans). On the 31st of January 1795 Hamilton resigned his office of treasury secretary of the United States and returned to the practice of law in New York, leaving it for public service only in 1798-1800, when he was the active head, under Washington (who insisted that Hamilton should be second only to himself), of the army organized for war against France. But though in private life he remained the continual and chief adviser of Washington—notably in the serious crisis of the Jay Treaty, of which Hamilton approved. Washington's Farewell Address (1796) was written for him by Hamilton.

After Washington's death the Federalist leadership was divided (and disputed) between John Adams, who had the prestige of a varied and great career, and greater strength than any other Federalist with the people, and Hamilton, who controlled practically all the leaders of lesser rank, including much the greater part of the most distinguished men of the country, so that it has been very justly said that "the roll of his followers is enough in itself to establish his position in American history" (Lodge). But Hamilton was not essentially a popular leader. When his passions were not involved, or when they were repressed by a crisis, he was far-sighted, and his judgment was excellent. But as Hamilton himself once said, his heart was ever the master of his judgment. He was, indeed, not above intrigue, but he was unsuccessful in it. He was a fighter through and through, and his courage was superb; but he was indifferent in utterance, impulsive in management, opinionated, self-confident, and uncompromising in nature and methods. His faults are nowhere better shown than in his quarrel with John Adams. Three times, in order to accomplish ends deemed by him, personally, to be desirable, Hamilton used the political fortunes of John Adams, in presidential elections, as a mere hazard in his manoeuvres; moreover, after Adams became president, and so the official head of the party, Hamilton constantly advised the members of the president's cabinet, and through them endeavoured to control Adams's policy; and finally, on the eve of the crucial election of 1800, he wrote a bitter personal attack on the president (containing much confidential cabinet information), which was intended for private circulation, but which was secured and published by Aaron Burr, his legal and political rival.

The mention of Burr leads us to the fatal end of another great political antipathy of Hamilton's life. He read Burr's character correctly from the beginning; deemed it a patriotic duty to thwart him in his ambitions; defeated his hopes successively of a foreign mission, the presidency, and the governorship of New York; and in his conversations and letters repeatedly and unspiringly denounced him. If these denunciations were known to Burr they were ignored by him until his last defeat. After that he forced a quarrel on a trivial bit of hearsay (that Hamilton had said he had a "despicable opinion of Burr"); and Hamilton, believing as he explained in a letter he left before going to his death—that a complaisance with the duller indulgences of the time was inseparable from the ability to be in future useful in public affairs, accepted a challenge from him. The duel was fought at Weehawken on the Jersey shore of the Hudson opposite the City of New York. At the first fire Hamilton fell, mortally wounded, and he died on the following day, the 12th of July 1804. Hamilton had found the necessary fire, but his pistol went off as he fell. The tragic close of his career appeared for the moment the fierce hatred of politics, and his death was very generally deplored as a national calamity.

No emphasis, however strong, upon the mere consecutive personal successes of Hamilton's life is sufficient to show the measure of his importance in American history. That importance lies, to a large extent, in the political ideas for which he stood. His mind was eminently "legal." He was the unrivalled controversialist of the time. His writings, which are distinctly clear, vigorous, and rigid reasoning, rather than by any show of scholarship—in the extent of which he was sold in character Hamilton's might have been, he was surpassed by several of his contemporaries—are in general strikingly empirical in basis. He drew his theories from his experiences of the Revolutionary period, and he modified them hardly at all through life. In his earliest pamphlets (1774-1775) he started out with the ordinary pre-Revolutionary Whig doctrines of natural rights and liberty; but the first experience of semi-anarchic states'rights and individualism ended his fervour for ideas so essentially alien to his practical, logical mind, and they have no place in his later writings. The feeble inadequacy of conception, infirmity of power, factional jealousy, disintegrating particularism, and vicious finance of the Confederation were realized by many others; but none other saw so clearly the concrete nationalistic remedies for these concrete ills, or pursued remedial ends so constantly, so ably, and so consistently. An immigrant, Hamilton had no particularistic ties; he was by instinct a "continentalist" or federalist. He wanted a strong union and energetic government that should be respected as much as possible by all states and as little as possible on those of the state legislatures; that should have the support of wealth and class; and that should curb the states to such an "entire subordination" as nowise to be hindered by those bodies. At these ends he aimed with extraordinary skill in all his financial measures. As early as 1776 he urged the direct collection of federal taxes by federal agents. From 1779 onward we trace the idea of supporting government by the interest of the property classes; from 1781 onward the idea that a not-excessive public debt be a blessing, not a hindrance to the union. Hence his device by which the federal government, assuming the war debts of the states, secured greater resources, based itself on a high ideal of nationalism, strengthened its hold on the individual citizen, and gained the support of property. In his report on manufactures his chief avowed motive was to strengthen the union. To the same end he conceived the constitutional doctrines of liberal construction, "implied powers," and the "general welfare," which were later embodied in the decisions of John Marshall. The idea of nationalism pervaded and quickened all his life and works. With one great exception, the dictum of Guizot is hardly an exaggeration, that "there is not in the Constitution of the United States an element of order, of force, of duration, which he did not powerfully contribute to introduce into it and to cause to predominate."

1 Hamilton's widow, who survived him for half a century, dying at the age of ninety-seven, was left with four sons and four daughters. He had been an affectionate husband and father, though his devotion to his wife had been consistent with occasional lapses from strict marital fidelity. One intrigue into which he drifted in 1791, with a Mrs Reynolds, led to the blackmailing of Hamilton by her husband, and when this scandal, shortly afterwards, got into trouble for fraud, his relations with Hamilton were unscrupulously misrepresented for political purposes by some of Hamilton's supporters. But Hamilton faced the necessity of revealing the true state of things with conspicuous courage, and the scandal only reacted on his accusers. One of them was Monroe, whose reputation came very badly out of this unsavoury affair.

2 In later years he said no debt should be incurred without providing simultaneously for its payment.
The exception, as American history showed, was American democracy. The loose and barren rule of the Confederation seemed to conservative minds such as Hamilton's to presage, in its strengthening of individualism, a fatal loosening of social restraints, and led him on to a dread that never overcame. Liberty, he reminded his fellows, in the New York Convention of 1788, seemed to be alone considered in government, but there was another thing equally important: "a principle of strength and stability in the organization ... and of vigour in its operation." But Hamilton's governmental system was in fact repressive. He wanted a system strong enough, he would have said, to overcome the anarchic tendencies loosed by war, and represented by those notions of natural rights which he had himself once championed; strong enough to curtail the unwise, energetic, self-interest, power, influence, and to control—not, as Jefferson would have it, to be controlled by—the people. Confidence in the integrity, the self-control, and the good judgment of the people, which was the content of Jefferson's political faith, had almost no place in Hamilton's theories. "Men," said he, "are reasoning rather than reasonable animals." The charge that he laboured to introduce monarchy by intrigue is an under-estimate of his good sense. Hamilton's thinking, however, did carry him foul of current democratic philosophy; as he said, he presented his plan as "... as a system of limited self-control, which we ought to approach as far as possible"; moreover, he held through life his belief in its principles, and in its superiority over the government actually created; and though its inconsistency with American tendencies was yearly more apparent, he never ceased to avow on all occasions his aristocratic-monarchical partialities. Moreover, his preferences for at least an aristocratic republic were shared by many other men of talent. When it is added that Jefferson's assertions, alike as regards Hamilton's talk and the intent and tendency of his political measures, were, not to the extent of the underlying fact—but that discounting Jefferson's somewhat intemperate interpretations—unquestionably true, it cannot be accounted strange that Hamilton's Democratic opponents mistook his theoretic predilections for positive designs. Nor would it be a strained inference from much that he said, to believe that he hoped and expected that in the "crisis" he foresaw, when democracy should have caused the ruin of the country, a new government might be formed that should approximate to his own ideals. From the beginning of the excesses of the French Revolution he was possessed by the persuasion that American liberty, like the freedom of any other nation, might at any moment crush the restraints of the Constitution and put an end on a career of licence and anarchy. To this obsession he sacrificed his life. After the Democratic victory of 1800, his letters, full of retrospective judgments and interesting outlooks, are but rarely relieved in their sombre pessimism by flashes of hope and courage. His last letter on politics, written two days before his death, was a memorable denunciation of Jefferson and his followers. He evidently emphasized: in this letter he warns his New England friends against dismemberment of the union as "a clear sacrifice of great positive advantages, without any counterbalancing good; administering no relief to our real disease, which is democracy, the poison of which, by a subdivision, will only be more concentrated in each part, and consequently the more virulent." To the end he never lost his fear of the states, nor gained faith in the future of the country. He laboured still, in mingled hope and apprehension, to prop the frail and worthless fabric,77 which he feared would destroy all the advantages of his political faith, and which he hoped, by a little self-control, would be able to resist the attacks of the democrats. He was the leader of reactionary forces—constructive forces, which he had opposed in the critical period after the War of American Independence, and in the period of Federalist supremacy. He was in sympathy with the dominant forces of public life only while they took, during the war, the predominant impress of an imperfect nationalism. Jeffersonian democracy came into power in 1800 in direct line with colonial development; Hamiltonian Federalism was a break in that development; and this alone can explain how Jefferson could organize the Democratic Party in face of the brilliant success of the Federalists in constructing the government. Hamilton stigmatised his rival as a political fanatic; but as a party leader he claimed to be, Hamilton could not see, or would not concede, the predominating forces in American life, and which would uncomromisingly have minimized the two great political conquels of the colonial period—local self-government and democracy.

Few Americans have received higher tributes from foreign authors. Talleyrand, personally impressed when in America with Hamilton's brilliant qualities, declared that he had the power of divining without reasoning, and compared him to Fox and Burke. Jefferson, himself a Congressman and Senator, was one of the judges rendered by his countrymen, Washington's confidence in his ability and integrity is perhaps the most significant. Chancellor James Kent, and others only less competent, paid remarkable testimony to his legal abilities. Chief-justice Marshall ranked him second to Washington alone. No judgment of his own worth in 1802. In justification of the above statements see the correspondence of 1806-1804 between Morris and Jefferson, in Works, v. 636, 425, 434, 440, 445 (or 8: 543, 591, 596, 605, 606). 6

HAMILTON, ANTHONY—HAMILTON, ELIZABETH

is more justly measured than Madison's (in 1814): "That he possessed intellectual powers of the first order, and the moral qualities of a manly and sound mind in a captivating degree, has been awarded him by a suffrage now universal. If his theory of government deviated from the republican standard he had the candour to avow it, and the greater merit of co-operating faithfully in maintaining and supporting a system which was not his choice."

In person Hamilton was rather short and slender; in carriage, erect, dignified and graceful. Deep-set, changeable, dark eyes vivified his mobile features, and set off his light hair and fair, ruddy countenance. His carriage and bearing were most articulate; he is boldly poised and very striking. The captivating charm of his manners and conversation is attested by all who knew him, and in familiar life he was artlessly simple. Friends he won readily, and he held them in devoted attachment by the solid worth of a frank, ardent, generous, warm-hearted and high-minded character. Versatile as were his intellectual powers, his nature seems comparatively simple. A firm will, tireless energy, aggressive courage and bold self-confidence were its leading qualities; the word "intensity" perhaps sums up his quality. His Scotch and Gallic strain in a grand manner are evident; his countenance was decidedly Scotch; his nervous speech and bearing and vehement temperament rather French; in his mind, agility, clarity and penetration were matched with logical solidity. The remarkable quality of his mind lay in the rare combination of acute analysis and grasp of detail with great comprehensiveness of thought. So far as his writings show, he was almost wholly lacking in humour, and in imagination little less so. He certainly had wit, but it is hard to believe he could have had any touch of fancy. In public speaking he often combined the intellectual and the emotional qualities, a combination that might take the place of imagination and enabled him, on the coldest theme, to move deeply the feelings of his auditors.

BIBLIOGRAPHY.—Hamilton's Works have been edited by H. C. Lodge (New York, 9 vols., 1885-1886, and 12 vols., 1904); all references above are first to the latter edition, secondly (in brackets) to the former. There are various additional editions of The Federalist, notably those of H. B. Dawson (1863), H. C. Lodge (1888), and —the most scholarly—P. L. Ford (1898); cf. American Historical Review, ii. 413, 675. See also James Bryce, "Predictions of Hamilton and de Tocqueville," in Johns Hopkins University Studies, vol. 5 (Baltimore, 1887), and the capital essay of Anson D. Morse in the Political Science Quarterly, v. (1890), pp. 1-23. For a bibliography of English and French works, see C. E. Lewis, American Historical Review, x. 219, 231, and International Bibliography of the History of the U.S., pp. 780-810. The unfinished Life of Alexander Hamilton, by his son, J. C. Hamilton, going only to 1778 (New York, 2 vols., 1834-1835), is of course superseded; but the best and most useful of a number of biographies (since it is rather revolutionary and uncritical History of the Republic... as traced in the Writings of Alexander Hamilton (New York, 7 vols., 1857-1864; 4th ed., Boston, 1879), Professor W. G. Sumner's Alexander Hamilton (Macmillan, 1890) is appreciative, and important for its criticism from the point of view of an American free-trader; see also, on Hamilton's finance and economic views, Prof. C. F. Dunbar, Quarterly Journal of Economics, iii. (1889), p. 32; E. G. Bourne in 1840, x. (1844), p. 325; E. C. Lant in Journal of Political Economy, iii. (1893), p. 289. Among modern studies must also be mentioned J. T. Morse's able Life (1876); H. C. Lodge's (in the American Statesmen series, 1882); and G. Shear's two books, his Historical Study (1877) and Life and Epoch (1879). C. J. Rickett's Hamilton and his Contemporaries (1884), written during the Civil War, is sympathetic, but rather speculative. The magnificent Life by John L. Hall in a Low countries' edition, the first in which Jackson's summary of a historical romance, The Conqueror (New York, 1902), for the writing of which the author made new investigations into the biographical details, and elucidations, is valuable. It is not an easy task to study A Few of Hamilton's Letters (1903). F. S. Oliver's brilliant Alexander Hamilton: An Essay on American Union (London, 1906), which uses its subject to illustrate the necessity of British imperial federation, is an original and provocative book. The life of a non-American author brings out so well the wider issues involved in Hamilton's economic policy.

HAMILTON, ANTHONY, or ANTOINE (1646-1720), French classical author, was born about 1646. He is especially noteworthy from the fact that, though by birth he was a foreigner, his literary characteristics are more decidedly French than those of many of the most indubitable Frenchmen. His father was George Hamilton, younger brother of James, 2nd earl of Abercorn, and head of the family of Hamilton in the peerage of Scotland, and 6th duke of Châteauerc in the peerage of France; and his mother was Mary Butler, sister of the 1st duke of Ormonde. According to some authorities he was born at Drogheda, but according to the London edition of his works in 1811 his birthplace was Roscrea, Tipperary. From the age of four till he was fourteen the boy was brought up in France, whither his family had removed after the execution of Charles I. The fact that, like his father, he was a Roman Catholic, prevented his receiving the political promotion he might otherwise have expected on the Restoration, but he became a distinguished member of a brilliant band of courtiers whose champion he was to become. He took service in the French army, and the marriage of his sister Elizabeth, "la belle Hamilton," to Philibert, comte de Gramont (q.v.) rendered his connexion with France more intimate, if possible, than before. On the accession of James II. he obtained an infantry regiment in Ireland, and was appointed governor of Limerick and a member of the privy council. But the battle of the Boyne, at which he was present, brought disaster on all who were attached to the cause of the Stuarts, and before long he was again in France—an exile, but at the court of the rest of Europe. In 1723 he was created Lord St Germain and in the châteaux of his friends. With Ludovise, duchesse du Maine, he became an especial favourite, and it was at her seat at Sceaux that he wrote the Mémoires that made him famous. He died at St Germain-en-Laye on the 21st of April 1720.

It is mainly by the Mémoires du comte de Gramont that Hamilton takes rank with the most classical writers of France. It was said to have been written at Gramont's dictation, but it is very evident that Hamilton's share is the most considerable. The work was first published anonymously in 1723 under the title of La Vie de Colone, but it was really printed in Holland, at that time the great patroness of all questionable authors. An English translation by Boyer appeared in 1714. Upwards of thirty editions have since appeared, the best of the French being Renouard's (1812), forming part of a collected edition of Hamilton's works, and Gustave Brunet's (1859), and the best of the English, Edwards's (1793), with 78 engravings from portraits in the royal collections at Windsor and elsewhere, A. F. Bertrand de Molèville's (2 vols., 1811), with 64 portraits by E. Scriven and others, and Gordon Goodwin's (2 vols., 1903). The original edition was reprinted by Benjamin Tristram in 1786, and this edition was the satiric parody of the romantic tales which Antoine Galland's translation of The Thousand and One Nights had brought into favour in France, Hamilton wrote, partly for the amusement of Henrietta Burke, sister of the duchess of Berwick, to whom he was much attached, four ironical and extravagant contes, Le Bélier, Fleur d'épine, Zénodye and Les Quatre Farcadins. The saying in Le Bélier "Bélier, mon ami, tu me ferais plaisir si tu voulais commencer par le commencement," has passed into a proverb. These tales were circulating privately during Hamilton's lifetime, and the first three appeared in Paris in 1730, ten years after the death of the author; a collection of his Œuvres diverses in 1731 contained the unfinished Zénodye. Hamilton was also the author of some songs as exquisite in their way as his prose, and interchangeably amusing verses with the duke of Berwick. In the name of his niece, the countess of Stafford, Hamilton maintained a witty correspondence with Lady Mary Wortley Montagu.

See notices of Hamilton in Lescure's edition (1873) of the Contes, Sainte-Beuve's Cœursaures du lendemain, tome i, Sayou's Histoire de la littérature française, and Hugues's (1853), and by L. S. Auger in the Œuvres complètes (1804).

HAMILTON, ELIZABETH (1758-1816), British author, was born at Belfast, of Scottish extraction, on the 21st of July 1758. Her father's death in 1759 left his wife so embarrassed that Elizabeth was adopted in 1762 by her paternal aunt, Mrs Marshall, who lived in Scotland, near Stirling. In 1788 Miss Hamilton went to live with her brother Captain Charles Hamilton (1753-1792), who was engaged on his translation of the Hedyaya. Prompted by her brother's associations, she produced her
HAMILTON, LADY—HAMILTON, JAMES

Letters of a Hindoo Rajah in 1796. Soon after, with her sister
Mrs Blake, she settled at Bath, where she published in 1800 the
Memories of Modern Philosophers, a satire on the admirers of
the French Revolution. In 1801-1802 appeared her Letters
on Education. After traversing through Wales and Scotland for
nearly two years, the sisters took up their abode in 1803 at
Edinburgh. In 1804, Miss Hamilton, as she then preferred to be
called, published her Life of Agrrippina, wife of Germanicus; and
in the same year she received a pension from government.
The Cottagers of Glenburnie (1808), which is her best-known work,
was described by Sir Walter Scott as "a picture of the rural
habits of Scotland, of striking and impressive fidelity." She
also published Popular Essays on the Elementary Principles
of the Human Mind (1812), and Hints addressed to the
Patrons and Directors of Public Schools (1815). She died at Harrogate
on the 23rd of July 1816.

Memoirs of Mrs Elizabeth Hamilton, by Miss Benger, were
published in 1818.

HAMILTON, EMMA, LADY (c. 1765-1816), wife of Sir William
Hamilton (q.v.), the British envoy at Naples, and famous as
the mistress of Nelson, was the daughter of Henry Lyon, a
blacksmith of Great Neston in Cheshire. The date of her birth
cannot be fixed with certainty, but she was baptised at Great
Neston on the 12th of May 1765, and it is not improbable that
she was born in that year. Her baptismal name was Emily.
As his fiancée, she married, soon after her birth, the mother, who was
deleted, and in her distress applied to the Hon. Charles Greville, to whom
she was already known. At this time she called herself Emily
Hart. Greville, a gentleman of artistic tastes and well known
in society, entertained her as his mistress, her mother, known
as Mrs Cadogan, acting as housekeeper and partly as servant.
Under the protection of Greville, whose means were narrowed
by debt, she acquired some education, and was taught to sing,
dance and act with professional skill. In 1782 he introduced
her to his friend Romney the portrait painter, who had been
established in London for many years in the art of the old school, doing
beauty with enthusiasm. The numerous famous portraits of
her from his brush may have somewhat idealised her apparently
robust and brilliantly coloured beauty, but her vivacity and
powers of fascination cannot be doubted. She had the tempera-
ment of an artist, and seems to have been sincerely attached to
Greville. In 1784 she was seen by his uncle, Sir William
Hamilton, who admired her greatly. Two years later she was
sent on a visit to him at Naples, as the result of an understanding
between Hamilton and Greville—the uncle paying his nephew’s
debts and the nephew eking his mistress. Emma at first
resented, but then submitted to the arrangement. Her beauty,
her artistic capacity, and her high spirits soon made her a great
favourite in the easy-going society of Naples, and Queen Maria
Carolina became closely attached to her. She became famous for
her "attitudes," a series of poses plastiques in which she
represented classical and other figures. On the 6th of September
1791, during a visit to England, she was married to Sir W.
Hamilton. The ceremony was required in order to justify her
public reception at the court of Naples, where Lady Hamilton
played an important part as the agent through whom the queen
communicated with the British minister—sometimes in opposi-
tion to the will and the policy of the king. The revolutionary
wars and disturbances which began after 1792 made the services of
Lady Hamilton always useful and sometimes necessary to the
British government. It was claimed by her, and on her
behalf, that she secured valuable information in 1796, and was
of essential service to the British fleet in 1798 during the Nile
campaign, by enabling it to obtain stores and water in Sicily.
These claims have been denied on the rather irrelevant ground
that they are wanting in official confirmation, which was only
accorded through the French ambassador, official and secret,
but it is not improbable that they were considerably exaggerated,
and it is certain that her stories cannot always be reconciled
with one another or with the accepted facts. When Nelson
returned from the Nile in September 1798 Lady Hamilton made
him her hero, and he became entirely devoted to her. Her
influence over him indeed became notorious, and brought him
much official displeasure. Lady Hamilton undoubtedly used
her influence to draw Nelson into a most unhappy participation
in the domestic troubles of Naples, and when Sir W. Hamilton
was recalled in 1800 she travelled with him and Nelson occasion-
ally across Europe. In England Lady Hamilton insisted on
making a parade of her hold over Nelson. Their child, Horatia
Nelson Thompson, was born on the 30th of January 1801.
The profuse habits which Emma Hamilton had contracted in Naples,
together with a passion for gambling which grew on her, led her
to debt, and also into extravagant ways of living, against which
her husband feebly protested. On his death in 1803 she received
by his will a life-tenant of £300, and the furniture of his house in
Piccadilly. She then lived openly with Nelson at his house at
Naples, but not in any way openly recognized. The services rendered at Naples, but did not succeed. On his
death she received Merton, and an annuity of £300, as well as
the control of the interest of the £3000 he left to her daughter.
But gambling and extravagance kept her poor. In 1808 her
friends endeavoured to arrange her affairs, but in 1813 she was
put in prison for debt and remained there for a year. A certain
Alderman Smith having aided her to get out, she went over to
Calais for refuge from her creditors, and she died there in
distress if not in want on the 15th of January 1815.

AUTHORITIES.—The Memoirs of Lady Hamilton (London, 1815)
were the work of an ill-disposed but well-informed and shrewd
observer whose name is not given. Lady Hamilton and Lord
Nelson, by J. C. Jefferson (London, 1868) is based on authentic papers.
It is corrected in some particulars by the detailed recent life written
by Walter Sichel, Emma, Lady Hamilton (London, 1905). See also
the authorities given in the article NELSON.

D. H.)

HAMILTON, JAMES (1759-1831), English educationist, and
author of the Hamiltonian system of teaching languages, was
born in 1759. The first part of his life was spent in mercantile
pursuits. Having settled in Hamburg and become free of the
city, he was anxious to become acquainted with German and
Polish, but found himself confined to English. General d'Argen
In twelve lessons he found himself able to read an easy German
book, his master having discarded the use of a grammar and
translated to him short stories word for word into French. As
a citizen of Hamburg Hamilton started a business in Paris, and
during the peace of Amiens maintained a lucrative trade with
England; but at the rupture of the treaty he was made a prisoner
of war, and though the protection of Hamburg was enough to get
the words effacé de la liste des prisonniers de guerre inscribed upon
his passport, he was detained in custody till the close of hostilities.
His business being thus ruined, he went in 1814 to America,
intending to become a farmer and manufacturer of potash;
but, changing his plan before he reached his "location," he
started as a teacher in New York. Adopting his old tutor's
method, he attained remarkable success in New York, Baltimore,
Washington, Boston, Montreal and Quebec. Returning to
England in July 1823, he was equally fortunate in Manchester
and elsewhere. The two master principles of his method were
that the language should be presented to the scholar as a living
organism, and that its laws should be learned from observation
and drill. He lived in London, with occasional visits to
Philadelphia, and was vigorously attacked and defended. In 1826
Sydney Smith devoted an article to its elucidation in the
Edinburgh Review. As textbooks for his pupils Hamilton printed interlinear
translations of the Gospel of John, of an Epitome historiae sacrae,
of Aesop's Fables, Eutropius, Aurelius Victor, Phaedrus, &c., and
many books were issued as Hamiltonian with which he
Hamilton, James, 1st Duke of (1666–1649), Scottish nobleman, son of James, 2nd marquess of Hamilton, and of the Lady Anne Cunningham, daughter of the earl of Glencarin, was born on the 18th June 1666. As the descendant and representative of James Hamilton, 1st earl of Arran, he was the heir to the throne of Scotland after the descendants of James VI. He married in his fourteenth year Mary Fielding, aged seven, daughter of Lord Fielding, afterwards 1st earl of Denbigh, and was educated at Exeter College, Oxford, where he matriculated on the 14th of December 1621. He succeeded to his father's titles on the latter's death in 1625. In 1628 he was made master of the horse and was also appointed gentleman of the bedchamber and a privy councillor. In 1631 Hamilton took over a force of 6000 men to assist Gustavus Adolphus in Germany. He guarded the fortresses on the Oder while Gustavus fought Tilly at Breitenfeld, and afterwards occupied Magdeburg, but his army was destroyed by disease and starvation, and after the complete failure of the expedition Hamilton returned to England in September 1634. He now became Charles I's chief adviser in Scottish affairs. In May 1638, after the outbreak of the revolt against the English Prayer-Book, he was appointed commissioner for Scotland to appease the discontented. He described the Scots as being "possessed by the devil," and instead of doing his utmost to support the king's interests was easily intimidated by the covenanting leaders and persuaded of the impossibility of resisting their demands, finally returning to Charles to urge him to give way. It is said that he so far forgot his trust as to encourage the Scottish leaders in their resistance in order to gain their favour. On the 27th of July Charles sent him back with new proposals for the election of an assembly and a parliament, episcopacy being safeguarded but bishops being made responsible to future assemblies. After a wrangle concerning the mode of election he again returned to Charles. Having been sent back to Edinburgh on the 17th of September, he brought with him a revocation of the prayer-book and canons and another covenant to be substituted for the national covenant. On the 21st of November Hamilton presided over the first meeting of the assembly in Glasgow cathedral, but dissolv ed it on the 28th on its declaring the bishops responsible to its authority. The assembly, however, continued to sit notwithstanding, and Hamilton returned to England to give an account of his failure, leaving the enemy triumphant and in possession. War was now decided upon, and Hamilton was chosen to command an expedition to the Forth to menace the rear of the Scots. On arrival on the 1st of May 1639 he found the plan impossible, despaired of success, and was recalled in June. On the 8th of July, after a hostile reception at Edinburgh, he resigned his commission. He supported Strafford's proposal to call the Short Parliament, but otherwise opposed him as strongly as he could, as the chief adversary of the Scots; and he aided the elder Vane, it was believed, in accomplishing Strafford's destruction by sending for him to the Long Parliament. Hamilton now supported the parliamentary party, desired an alliance with his nation, and persuaded Charles in February 1641 to admit some of their leaders into the council. On the death of Strafford Hamilton was confronted by a new antagonist in Montrose, who detected both his character and policy and repudiated his supremacy in Scotland. On the 10th of August 1641 he accompanied Charles on his last visit to Scotland. His aim now was to effect an alliance between the king and Argyll, the former accepting Presbyterianism and the latter the English parliament, and when this failed he abandoned Charles and adhered to Argyll. In consequence he received a challenge from Lord Ker, of which he gave the king information, and obtained from Ker an apology. Montrose wrote to Charles declaring he could prove Hamilton to be a traitor. The king himself spoke of him as being "very active in his own preservation." Shortly afterwards the plot—known as the "Incident"—to seize Argyll, Hamilton and the latter's brother, the earl of Lanark, was discovered, and on the 12th of October they fled from Edinburgh. Hamilton returned not long afterwards, and notwithstanding all that had occurred still retained Charles's favour and confidence. He returned with him to London and accompanied him on the 5th of January 1642 when he went to the city after the failure to secure the five members. In July Hamilton went to Scotland on a hopeless mission to prevent the intervention of the Scots in the war, and a breach then took place between him and Argyll. When in February 1643 proposals of mediation between Charles and the parliament came from Scotland, Hamilton instigated the "cross petition" which demanded from Charles the surrender of the annuities of tithes in order to embarrass Loudoun, the chief promoter of the project, to whom they had already been granted. This failing, he promoted a scheme for overwhelming the influence and votes of Argyll and his party by sending to Scotland all the Scottish peers then with the king, thereby preventing any assistance to the parliament coming from that quarter, while Charles was to guarantee the establishment of Presbyterianism in Scotland only. This foolish intrigue was strongly opposed by Montrose, who was eager to strike a sudden blow and anticipate his defeat. Having been sent to Edinburgh, Hamilton was detained in Argyll's castle, and was not released till the 5th of February. At last incurred Charles's resentment and he was sent, in January 1644, a prisoner to Pendennis Castle, in 1645 being removed to St Michael's Mount, where he was liberat ed by Fairfax's troops on the 23rd of April 1646. Subsequently he showed great activity in the futile negotiations between the Scots and Charles at Newcastle. In 1648, in consequence of the seizure of Charles by the army in 1647, Hamilton obtained a temporary influence and authority in the Scottish parliament over Argyll, and led a large force into England in support of the king on the 8th of July. He showed complete incapacity in military command; he was kept in check for some time by Lambert; and though outnumbering the enemy by 24,000 to about 9000 men, allowed his troops to disperse over the country and to be defeated in detail by Cromwell during the three days August 17th–19th at the so-called battle of Preston, being himself taken prisoner on the 25th. He was tried on the 6th of February 1649, condemned to death on the 6th of March and executed on the 9th.

Hamilton, during his unfortunate career, had often been suspected of betraying the king's cause, and, as agent to the Scottish throne, of intentionally playing into the hands of the Covenanters with a view of procuring the crown for himself. The charge was brought against him as early as 1631 when he was

See S. R. Gardiner in the Dict. of Nat. Biography.
levying men in Scotland for the German expedition, but Charles gave no credence to it and showed his trust in Hamilton by causing him to share his own room. The charge, however, always clung to him, and his intriguing character and hopeless management of the king's affairs in Scotland gave colour to the accusation. There seems, however, to be no real foundation for it. His career is sufficiently explained by his thoroughly weak and egotistical character. He took no interest whatever in the great and pressing exigencies of his country, but was always endeavoring only to preserve peace and to avoid personal losses. "He was devoid of intellectual or moral strength, and was therefore easily brought to fancy all future tasks easy and all present obstacles insuperable." A worse choice than Hamilton could not possibly have been made in such a crisis, and his want of principle, of firmness and resolution, brought irretrievable ruin upon the royal cause.

Hamilton's three sons died young, and the dukedom passed by special remainder to his brother William, earl of Lanark. On the latter's death in 1651 the Scottish titles reverted to the 1st duke's daughter, Anne, whose husband, William Douglas, was created (third) duke of Hamilton.

HAMILTON, JOHN (c. 1511-1571), Scottish prelate and politician, was a natural son of James Hamilton, 1st earl of Arran. At a very early age he became a monk and abbot of Paisley, and after studying in Paris he returned to Scotland, where he soon rose to a position of power and influence under his half-brother, the regent Arran. He was made keeper of the privy seal in 1543 and bishop of Dunkeld two years later; in 1546 he followed David Beaton as archbishop of St Andrews, and about the same time he became treasurer of the kingdom. He made vigorous efforts to stay the growth of Protestantism, but with one or two exceptions 

persecution was not the policy of Archbishop Hamilton, in 1551 in the interests of the Roman Catholic religion a cætechism called Hamilton's Catechism (published with an introduction by T. G. Law in 1884) was drawn up and printed, possibly at his instigation. Having incurred the displeasure of the Protectors, now the dominant party in Scotland, the archbishop was imprisoned in 1563. After his release he was an active partisan of Mary queen of Scots; he baptized the infant James, afterwards King James VI., and pronounced the divorce of the queen from Bothwell. He was present at the battle of Langside, and some time later took refuge in Dumbarton Castle. Here he was seized, and on the charge of being concerned in the murders of Lord Darnley and the regent Murray he was tried, and hanged on the 6th of April 1571. The archbishop had three children by his mistress, Grizel Sempill.

HAMILTON, PATRICK (1504-1528), Scottish divine, second son of Sir Patrick Hamilton, well known in Scottish chivalry, and of Catherine Stewart, daughter of Alexander, duke of Albany, second son of James II. of Scotland, was born in the diocese of Glasgow, probably at his father's estate of Stanehouse in Lanarkshire. He was educated probably at Linlithgow. In 1517 he matriculated at the University of Paris, and it was probably about the same year that he went to study at Paris, for his name is found in an ancient list of those who graduated there in 1520. It was doubtless in Paris, where Luther's writings were already exciting much discussion, that he received the germs of the doctrines he was afterwards to uphold. From Alexander Ales we learn that Hamilton subsequently went to Louvain, attracted probably by the fame of Erasmus, who in 1521 had his headquarters there. Returning to Scotland, the young scholar naturally selected St Andrews, the capital of the church and of learning, as his residence. On the 9th of June 1523 he became a member of the university of St Andrews, and on the 3rd of October 1524 he was admitted to its faculty of arts. There Hamilton attained such influence that he was permitted to conduct as preceptor a musical mass of his own composition in the cathedral. But the reformed doctrines had now obtained a firm hold on the young abbot, and he was eager to communicate them to his fellow-countrymen. Early in 1527 the attention of James Beaton, archbishop of St Andrews, was directed to the heretical and innovative nature of the young priest, whereupon he ordered that Hamilton should be formally summoned and accused. Hamilton fled to Germany, first visiting Luther at Wittenberg, and afterwards enrolling himself as a student, under Franz Lambert of Avignon, in the new university of Marburg, opened on the 30th of May 1527 by Philip, landgrave of Hesse. Hermann von dem Busche, one of the contributors to the Epistolae obscurorum virorum, John Frith and Tyndale were among those whom he met there. Late in the autumn of 1527 Hamilton returned to Scotland, bold in the belief that he was restored to his principles. He went to his brother's house at Kincavel, near Linlithgow, in which town he preached frequently, and soon afterwards he married a young lady of noble rank, whose name has not come down to us. Beaton, avoiding open violence through fear of Hamilton's high connections, invited him to a conference at St Andrews. The reformer, predicting that he was going to confirm the pious in the true doctrine by his death, resolutely accepted the invitation, and for nearly a month was permitted to preach and dispute, perhaps in order to provide material for accusation. At length, however, he was summoned before a council of bishops and clergy presided over by the archbishop; there were thirteen charges, seven of which were based on the doctrines affirmed in the Loci communes. On examination Hamilton maintained that these were undoubtedly true. The council condemned him as a heretic on the whole thirteen charges. Hamilton was seized, and, it is said, surrendered to the soldiery on an assurance that he would be restored to his friends without injury. The council convicted him, after a sham disputation with Friar Campbell, and handed him over to the secular power. The sentence was carried out on the same day (February 29, 1528) as he was summoned before a council of bishops and clergy presided over by the archbishop; there were thirteen charges, seven of which were based on the doctrines affirmed in the Loci communes. On examination Hamilton maintained that these were undoubtedly true. The council condemned him as a heretic on the whole thirteen charges. HAMILTON, ROBERT (1743-1829), Scottish economist and mathematician, was born at Firlig, Edinburgh, on the 11th of June 1743. His grandfather, William Hamilton, principal of Edinburgh University, had been a professor of divinity. Having completed his education at the university of Edinburgh, where he was distinguished in mathematics, Robert was induced to enter a banking-house in order to acquire a practical knowledge of business, but his ambition was really academic. In 1769 he gave up business pursuits and accepted the rectoryship of Perth academy. In 1779 he was elected to be the chair of natural philosophy at Aberdeen University. For many years, however, by private arrangement with his colleague Professor Copland, Hamilton taught the class of mathematics. In 1817 he was presented to the latter chair.

1 Hamilton's most important work is the Essay on the National Debt, which appeared in 1813 and was undoubtedly the first to expose the economic fallacies involved in Pitt's policy of a sinking fund. It is still of value. A posthumous volume published in 1870, The Progress of Society, is also of great ability, and is a very effective treatment of economical principles by tracing their natural origin and position in the development of social life. Some minor works of a practical character (Introduction to Merchandise, 1777; Essay on War and Peace, 1790) are now forgotten.
HAMILTON, Thomas (1780–1842), Scottish writer, younger brother of the philosopher, Sir William Hamilton, Bart., was born in 1780. He was educated at Glasgow University, where he made a close friend of Michael Scott, the author of Tom Cringle's Log. He entered the army in 1810, and served throughout the Napoleonic and American campaigns, but continued to cultivate his literary tastes. On the conclusion of peace he withdrew, with the rank of captain, from active service. He contributed both prose and verse to Blackwood's Magazine, in which appeared his vigorous and popular military novel, Cyril Thornton (1827). His Annals of the Peninsular Campaign, published originally in 1829, and republished in 1849 with additions by Frederick Hardman, is written with great clearness and impartiality. His only other work, Men and Manners in America, is a record of travels in 1823, partly at the expense of British prejudice, and by the author's aristocratic dislike of a democracy. Hamilton died at Pisa on the 7th of December 1842.

HAMILTON, William (1704–1754), Scottish poet, the author of "The Braes of Yarrow," was born in 1704 at Bangour in Linlithgowshire, the son of James Hamilton of Bangour, a member of the Scottish bar. As early as 1724 we find him contributing to Allan Ramsay's Tea Table Miscellany. In 1745 Hamilton joined the cause of Prince Charles, and though he is said by William Hamilton to have never joined the battle of Prestonpans in verse. After the disaster of Culloden he lurked for several months in the Highlands and escaped to France; but in 1749 the influence of his friends procured him permission to return to Scotland, and in the following year he obtained possession of the family estate of Bangour. The state of his health compelled him, however, to live abroad, and he died at Lyons on the 25th of March 1754. He was buried in the Abbey Church of Holyroodhouse, Edinburgh. He was twice married—"into families of distinction" says the preface of the authorized edition of his poems.

Hamilton left behind him a considerable number of poems, none of them except "The Braes of Yarrow" of striking originality. The collection is composed of odes, epitaphs, short pieces of translation, songs, and occasional verses. The longest is "Contemplation, or the Triumph of Love" (about 500 lines). The first edition was published without his permission by Foulis (Glasgow, 1748), and introduced by a preface from the pen of Adam Smith. Another edition with corrections by himself was brought out by his friend in 1766, and to this was prefixed a posthumous notice by the printer.

In 1850 James Paterson edited The Poems and Songs of William Hamilton. This volume contains several poems till then unpublished, and gives a life of the author.

HAMILTON, Sir William (1730–1803), British diplomatist and archaeologist, son of Lord Archibald Hamilton, governor of Greenwich hospital and of Jamaica, was born in Scotland on the 13th of December 1730, and served in the 3rd Regiment of Foot Guards from 1747 to 1758. He left the army after his marriage with Miss Barlow, a Welsh heiress from whom he inherited an estate near Swansea upon her death in 1782. Their only child, a daughter, died in 1775. From 1761 to 1764 he was a member of parliament for Midhurst, but in the latter year he was appointed envoy to the court of Naples, a post which he held for thirty-six years—until his recall in 1800. During the greater part of this time the official duties of the minister were of small importance. It was enough that the representative of the British crown should be a man of the world whose means enabled him to entertain on a handsome scale. Hamilton was admirably qualified for these duties, being an amiable and accomplished man, who took an intelligent interest in science and art. In 1766 he became a member of the Royal Society, and between that year and 1780 he contributed to its Philosophical Transactions a series of observations on the action of volcanoes, which he had made, or caused to be made, at Vesuvius and Etna. He employed a draftsman named Fabris to make studies of the eruption of 1775 and 1776, and a Dominican, Resina, to make observations at a later period. He published several treatises on earthquakes and volcanoes between 1776 and 1783. He was a fellow of the Society of Antiquaries and of the Dilettanti, and a notable collector. Many of his treasures went to enrich the British Museum. In 1772 he was made a knight of the Bath. The last ten years of his life presented a curious contrast to the elegant peace of those which had preceded them. In 1791 he married Emma Lyon (see the separate article on Lady Hamilton). The outbreak of the French Revolution and the rapid extension of the revolutionary movement in Western Europe soon overwhelmed Naples. It was a misfortune for Sir William that he was left to meet the very trying political and diplomatic conditions which arose after 1793. His health had begun to break down, and he suffered from bilious fevers. He was in fact in a state approaching dotage before his recall, a fact which, combined with his senile devotion to Lady Hamilton, has to be considered in accounting for his extraordinary complaisance in her relations with Nelson. He died on the 6th of April 1803.

See E. Edwards, Lives of the Founders of the British Museum (London, 1870); and the authorities given in the article on Emma, Lady Hamilton.

HAMILTON, Sir William, Bart. (1766–1830), Scottish metaphysician, was born in Glasgow on the 8th of March 1766. His father, Dr William Hamilton, was a professor of anatomy in the university of Glasgow; and when he died in 1790, in his thirty-second year, he had already gained a great reputation. William Hamilton and a younger brother (afterwards Captain Thomas Hamilton, q.v.) were thus brought up under the sole care of their mother. William received his early education in Scotland, except during two years which he spent in a private school near London, and in 1807, as a Snell expeditioner, to Balliol College, Oxford. He obtained a first-class in litteris humanioribus and took the degree of B.A. in 1811, M.A. in 1814. He had been intended for the medical profession, but soon after leaving Oxford he gave up this idea, and in 1813 became a member of the Scottish bar. His life, however, was mainly that of a student; and the following years, marked by little of outward incident, were filled by researches of all kinds, through which he daily added to his stores of learning, while at the same time he was gradually forming his philosophic system. Investigation enabled him to make good his claim to represent the Hamilton family of Preston, from which he took up the barony, which had been in abeyance since the death of Sir Robert Hamilton of Preston (1650–1701), well known in his day as a Covenanting leader.

Two visits to Germany in 1817 and 1820 led to his taking up the study of German and later on that of contemporary German philosophy, which was then almost entirely neglected in the British universities. In 1820 he was a candidate for the chair of moral philosophy in the university of Edinburgh, which had fallen vacant on the death of Thomas Brown, colleague of Dugald Stewart, and the latter's consequent resignation, but was defeated on political grounds by John Wilson (1785–1854), the "Christopher North" of Blackwood's Magazine. Soon afterwards (1821) he was appointed professor of civil history, and as such delivered several courses of lectures on the history of modern Europe and the history of literature. The salary was £100 a year, derived from a local beer tax, and was discontinued after a time. No pupils were compelled to attend, the class dwindled, and Hamilton gave it up when the salary ceased. In January 1827 he suffered a severe loss in the death of his mother, to whom he had been a devoted son. In March 1828 he married his cousin Janet Marshall.

In 1829 his career of authorship began with the appearance of the well-known essay on the "Philosophy of the Unconditioned" (a critique of Comte's Cours de philosophie)—the first of a series of articles contributed by him to the Edinburgh Review. He was elected in 1836 to the Edinburgh chair of logic and metaphysics, and from this time dates the influence which, during the next twenty years, he exerted over the thought of the younger-
HAMILTON, SIR WILLIAM 889

generation in Scotland. Much about the same time he began the preparation of an annotated edition of Reid's works, intending to annex to it a number of dissertations. Before, however, this design had been carried out, he was struck (1844) with paralysis of the right side, which serious incapacitation to write, though it left his mind wholly unimpaired. The edition of Reid appeared in 1846, but with only seven of the intended dissertations—the last, too, unfinished. It was his distinct purpose to complete the work, but this purpose remained at his death unfulfilled, and all that could be done afterwards was to print such materials for the remainder, or such notes on the subjects to be discussed, as were found among his MSS. Considerably before this time he had formed his theory of logic, the leading principles of which were indicated in the prospectus of an essay on logic to be contributed to the 'Encyclopedia of Scotland.' Still, the elaboration of the scheme in its details and applications continued during the next few years to occupy much of his leisure. Out of this arose a sharp controversy with Augustus de Morgan. The essay did not appear, but the results of the labour gone through are contained in the appendices to his Lectures on Logic. Another occupation of these years was the preparation of extensive materials for a publication which he designed on the personal history, influence and opinions of Luther. Here he advanced so far as to have planned and partly carried out the arrangement of its materials, but of this no further, and still remains in MS. In 1835-1839 appeared the first and second editions of his Discourses in Philosophy, Literature and Education, a reprint, with large additions, of his contributions to the Edinburgh Review. Soon after, his general health began to fail. Still, however, aided now as ever by his devoted wife, he persevered in literary labour; and during 1835-1836 he brought out nine volumes of a new edition of Stewart's works. The only remaining volume was to have contained a memoir of Stewart, but this he did not live to write. He taught his class for the last time in the winter of 1835-1836. Shortly after, a serious attack of consumption he was taken ill, and on the 6th of May 1836 he died in Edinburgh.

Hamilton's positive contribution to the progress of thought is comparatively slight, and his writings, even where reinforced by the copious lecture notes taken by his pupils, cannot be said to present a comprehensive philosophic system. None the less he did considerable service by stimulating a spirit of criticism in his pupils, by insisting on the great importance of psychology as opposed to the older metaphysical methods, and not least by his recognition of the importance of the distinction of sense and intuition, each in its own important work was his 'Philosophy of the Unconditioned,' the development of the principle that for the human finite mind there can be no knowledge of the Infinite. The basis of his whole argument is an antithesis which is the mind's relation with Kant's antithesis between subject and object, the knowing and the known, Hamilton laid down the principle that every object is known only in virtue of its relations to other objects (see RELATIVITY OF KNOWLEDGE). From this it follows limitless time, space, power and so forth are humanly speaking incoercible. The fact, however, that all thought seems to demand the idea of the Infinite or absolute provides a sphere for faith, which is thus the specific philosophy of theology. It is a weakness characteristic of the human mind that it cannot conceive any phenomenon without a beginning: hence the conception of the causal relation, according to which every phenomenon has its cause, preceding phenomenon, and its effect in subsequent phenomena. The causal concept is, therefore, only one of the ordinary necessary forms of the cognitive consciousness limited, as have been shown, by the principle that which is not causally related to something else is complete or conditioned. As regards the problem of the nature of objectivity, Hamilton simply accepts the evidence of consciousness as to the separate existence of the object: 'the root of our nature cannot be a lie.' In virtue of this assumption Hamilton's philosophy becomes a 'natural realism.' In fact his whole position is a strange compound of Kant and Reid. Its chief practical corollary is the denial of philosophy as a method of attaining absolute knowledge and its relegation to the academic sphere of mental training. The transition from philosophy to theology, i.e. to the sphere of faith, is presented by Hamilton under the analogous relation between the mind and the religious mystery, as its knowledge is conditioned Absolute or God to the world of the conditioned. Conditioned, itself a conditioned phenomenon, must derive from or depend on different things prior to or behind material phenomena. Consequently, Hamilton, having made no statement about that God, who in the terms of the analogy bears to the conditioned mind the relation which the conditioned mind bears to its objects, can himself be unconditioned. He can be regarded only as the highest relation within the world of phenomena as far as is conditioned. It is thus an absolute or unconditioned. Thus the very principles of Hamilton's philosophy are apparently violated in his theological argument. Hamilton regarded logic as a purely formal science; it seemed to him an incoherent mass of heterogeneous principles, to treat as parts of the same science the formal and the material conditions of knowledge. He was quite ready to allow that on this fundamental point it is impossible to be certain; but it seemed to him as if the total of his logical method, based on the laws of thought and deriving thence its several laws. The only logical laws which he recognized were the three axioms of identity, non-contradiction, and exclusion, and he regarded as several phases of one general law, the law of thought, i.e. the law of thought, therefore, of thought. The law of reason and consequence he considered not as different, but merely as expressing metaphysically what he called the general law of thought. "It was not, he said, in his theory of importance—that logic be allowed to state explicitly what is thought implicitly." In logic, Hamilton is known chiefly as the inventor of the doctrine of the correspondence, or as a philosopher, his 'natural realism,' i.e. that, as the judgment 'All A is B' should really mean 'All A is all B,' whereas the ordinary universal proposition should be stated 'All A is some B.' This view, which was supported by Stanley Jevons, is fundamentally opposed to the conception of system. Since it it imposes a complete restriction in the mode of a judgment, in point of fact when a judgment is made, e.g. about men, that they are mortal ('All men are mortal'), the intention is to determine the individual in question as falling under a general rule (the predicate is used in connotation). In other words, we are not concerned with the question what the thought is among the various things which must die? (as is implied in the form 'all men are some mortals') but 'what is the fact about the individual man?' There are two main arguments, one the general opinion of further, e.g., H. W. B. Joseph, Introduction to Logic, 1906, pp. 198 foll.).

The philosopher to whom above all others Hamilton professed allegiance was Aristotle. His works were the object of his profoundest admiration, and his student's edition contains all that his whole philosophy was cast. With the commentators on the Aristotelian writings, ancient, medieval and modern, he was also familiar; and the scholastic philosophy he studied with care and from the books he had acquired he had a particularly close attention in his mind. His wide reading enabled him to trace many a doctrine to the writings of forgotten thinkers; and nothing gave him greater pleasure than to draw forth such from their obscurity, and to give due acknowledgment, even if it chanced to be of the prior possession of a view or argument that he had thought out for himself. Of modern German philosophy he was a diligent, if not always sympathetic, student. How profoundly his thinking was modified by that of Kant is evident from the tenor of his speculations; nor was this less the case because, on fundamental points, he came to widely different conclusions. His position was incompletely which regarded him only as a philosopher, for his knowledge and his interests embraced all subjects related to that of the human mind. Physical and mathematical science had, indeed, no attraction for him; but he was a profound student of theology. His taste, however, literature alone in all modern scholarship was widely and deeply read; and, from his unusual powers of memory, the store of which he had acquired were always at command. If there was one period with the literature of which he was more particularly familiar it was the 16th and 17th centuries. Here in every department he was at home. He had gathered a vast amount of its theological lore, had a critical knowledge especially of its Latin poetry, and was minutely acquainted with the history of the actors in its varied scenes not only as narrated in professed records, but as revealed in the letters, table-talk, and casual effusions of themselves or their contemporaries (cf. his article on the Epistolae obscurorum virorum, and his pamphlet on the Disruption of the Church of Scotland in 1843). Among his literary projects were editions of the works of George Buchanan and of Thomas Caecil Scaliger. His general scholarship found expression in his library, which was admirably arranged, and in a philosophical collection. It now forms a distinct portion of the library of the university of Glasgow. His professional education—an interest which he manifested alike as a teacher and as a writer, and which had led him long before he was either to a study of the subject both theoretical and historical. He thence adopted views as to the ends and methods of teaching that are singularly out of step with what is now met with general recognition; but he also expressed in one of his articles an unflavourably view of the study of mathematics as a mere gymnastic, which excited much opposition, but which he never gave reason for. His writings on education are progressive and successful, and his writings on university organization and reform had, at the time of their appearance, a decisive practical effect, and contributed largely to extending the limits of both. His posthumous works are his Lectures on Metaphysics and Logic, 4 vols., edited by H. L. Mansel, Oxford, and John Veitch (Metaphysics,
HAMILTON, W. G.—HAMILTON, SIR W. ROWAN

HAMILTON, WILLIAM GERARD (1729–1796), English statesman, popularly known as "Single Speech Hamilton," was born in London on the 28th of January 1729, the son of a Scottish bencher of Lincoln's Inn. He was educated at Winchester and at Oriel College, Oxford. Inheriting his father's fortune he entered political life and became M.P. for Petersfield, Hampshire.

His maiden speech, delivered on the 13th of November 1755, during the debate on the address, which excited Walpole's admiration, is generally supposed to have been his only effort in the House of Commons. But the nickname "Single Speech" is undoubtedly misleading, and Hamilton is known to have spoken with success on other occasions, both in the House of Commons and in the Irish parliament. In 1760 he was appointed one of the commissioners for trade and plantations, and in 1761 he became chief secretary to Lord Halifax, the lord-lieutenant of Ireland, as well as Irish M. P. for Kilkenny and English M. P. for Pontefract. He was chancellor of the exchequer in Ireland in 1763, and subsequently filled various other administrative offices. Hamilton was thought very highly of by Dr Johnson, and it is certain that he was strongly opposed to the British taxation of America. He died in London on the 16th of July 1796, and was buried in the chancel vault of St Martin's-in-the-fields.

Two of his speeches in the Irish House of Commons, and some other miscellaneous works, were published after his death under the title Parliamentary Legog.

HAMILTON, SIR WILLIAM ROWAN (1805–1865), Scottish mathematician, was born in Dublin on the 4th of August 1805. His father, Archibald Hamilton, who was a solicitor, and his uncle, James Hamilton (curate of Trim), migrated from Scotland in youth. A branch of the Scottish family to which they belonged had settled in the north of Ireland in the time of James I., and this fact seems to have given rise to the common impression that Hamilton was an Irishman.

His genius first displayed itself in the form of a wonderful power of acquiring languages. At the age of seven he had already made very considerable progress in Hebrew, and before he was thirteen he had acquired, under the care of his uncle, who was an extraordinary linguist, almost as many languages as he had years of age. Among these, besides the classical and the modern European languages, were included Persian, Arabic, Hindustani, Sanskrit and even Malay. But though to the very end of his life he retained much of the singular learning of his childhood and youth, often reading Persian and Arabic in the intervals of sterners pursuits, he had long abandoned them as a study, and employed them merely as a relaxation.

His mathematical studies seem to have been undertaken and carried to their full development without any assistance whatever, and the result is that his writings belong to no particular "school," unless indeed we consider them to form, as they are well entitled to do, a school by themselves. As an arithmetical calculator he was not only wonderfully expert, but he seems to have occasionally found a positive delight in working out an enormous number of places of decimals the result of some irksome calculation. At the age of twelve he engaged Zerah Colburn, the American "calculating boy," who was then being exhibited as a curiosity in Dublin, and he had not always the worst of the encounter. But, two years before, he had accidentally fallen in with an extraordinary man of mathematics, whom, at the age of twelve he attacked Newton's Arithmetica universalis. This was his introduction to modern analysis. He soon commenced to read the Principia, and at sixteen he had mastered a great part of that work, besides some more modern works on analytical geometry and the differential calculus.

About this period he was also engaged in preparation for entrance at Trinity College, Dublin, and had therefore to devote a portion of his time to classics. In the summer of 1822, in his seventeenth year, he began a systematic study of Laplace's Mecanique Celeste. Nothing could be better fitted to call forth such mathematical powers as those of Hamilton; for Laplace's great work, rich to professional in analytical processes alike novel and powerful, demands from the most gifted student careful and often laborious study. It was in the successful effort to open this treasure-house that Hamilton's mind received its final temper, "Dès lors il commence à marcher seul," to use the words of the biographer of another great mathematician. From that time he appears to have devoted himself almost wholly to original investigation (so far at least as regards mathematics), though he ever kept himself well acquainted with the progress of science both in Britain and abroad.

At last, after a long delay, in 1834, when one of Laplace's demonstrations, he was induced by a friend to write out his remarks, that they might be shown to Dr John Brinkley (1763–1835), afterwards bishop of Clony, but who was then the first royal astronomer for Ireland, and an accomplished mathematician. Brinkley seems at once to have perceived the vast talents of young Hamilton, and to have encouraged him in the kindest manner. He is said to have remarked in 1823 of this lad of eighteen: "This young man, I do not say will be, but is, the first mathematician of his age." His whole career at Trinity College was perhaps unexampled. Amongst a number of competitors of more than ordinary merit, he was first in every subject and at every examination. He achieved the rare distinction of obtaining an optime for both Greek and for physics. How many more such honours he might have attained it is impossible to say; but he was expected to win both the gold medals at the degree examination, had his career as a student not been cut short by an unprecedented event. This was his appointment to the Andrews professorship of astronomy in the university of Dublin, vacated by Dr Brinkley in 1837. The chair was not exactly offered to him, as has been sometimes asserted, but the electors, having met and talked over the subject, authorized one of their number, who was Hamilton's personal friend, to urge him to become a candidate, a step which his modesty had prevented him from taking. Thus, when barely twenty-two, he was established at the Observatory, Dunsink, near Dublin. He was not specially fitted for the post, for although he had a profound acquaintance with theoretical astronomy, he had paid but little attention to the regular work of the practical astronomer. And it must be said that his time was seldom employed in original investigations that it would have been had he spent it in observations made even with the best of instruments,—infinitely better than if he had spent it on those of the observatory, which, however good originally, were then totally unfit for the delicate requirements of modern astronomy. Indeed there can be little doubt that Hamilton was intended by the university authorities who elected him to the professorship of astronomy to spend his time as he best could for the advancement of science, without being tied down to any particular branch. Had he devoted himself to practical astronomy they would assuredly have furnished him with modern instruments and an adequate staff of assistants.

In 1835, being secretary to the meeting of the British Association which was held that year in Dublin, he was knighted by the lord-lieutenant. But far higher honours rapidly succeeded, among which we may merely mention his election in 1837 to the president's chair in the Royal Irish Academy, and the rare distinction of being made corresponding member of the academy of St Petersburg. These are the few salient points (other, of course, than the epochs of his more important discoveries and inventions presently to be considered) in the uneventful life of this great man. He retained his wonderful faculties unimpaired to the very last, and steadily continued till within a day or two of his death, which occurred on the 2nd of September 1865, the task (his Elements of Quaternions) which had occupied the last six years of his life.

The germ of his first great discovery was contained in one of those early papers in which he sought to simplify Laplace's Du Mote, under the title of "Caustics," it was presented in 1824 to the Royal Irish Academy. It was referred as usual to a committee. Their report, while acknowledging the novelty and value of its
Hamilton, a town of Dundas and Normanby counties, Victoria, Australia, on the Grange Burne Creek, 107½ m. by rail, W. Many of which are its townships. Hamilton is a number of educational institutions, chief among which are the Hamilton and Western District College, one of the finest buildings of its kind in Victoria, the Hamilton Academy, and the Alexandra ladies' college, a state school, and a Catholic college. It has a fine racecourse, and pastoral and agricultural exhibitions are held annually, as the surrounding district is mainly devoted to sheep-farming. Mutton is frozen and exported. Hamilton became a borough in 1859.

Hamilton (Grand or Hamilton), the chief river of Labrador, enters Lake Attikona, which rises in the Labrador highlands at an elevation of 1700 ft., its chief sources being Lakes Attikonk and Ashunani, between 65° and 66° W. and 52° and 53° N. After a precipitous course of 600 m. it empties into Melville Lake (90 m. long and 18 wide), an extension of Hamilton inlet, on the Atlantic. About 220 m. from its mouth occurs the Grand Falls of Labrador. Here in a distance of 12 m. the river drops 760 ft., culminating in a final vertical fall of 316 ft. Below the falls are violent rapids, and the river sweeps through a deep and narrow canyon. The country through which it passes is for the most part a wilderness of barren rock, full of lakes and lacustrine rivers, and is largely covered by pine woodlands; along the southern margins of the valley spruce and poplars grow to a moderate size. From the head of Lake Attikona a steep and rocky portage of less than a mile leads to Burnt Lake, which is drained by the St Lawrence by the Romaine river.

Hamilton, one of the chief cities of Canada, capital of Wentworth county, Ontario. It occupies a highly picturesque situation upon the shore of a spacious land-locked bay at the western end of Lake Ontario. It covers the plain stretching between the water-front and the escarpment (called "The Mountain"), this latter being a continuation of that over which the Falls of Niagara plunge 40 m. to the west. Founded about 1778 by one Robert Land, the growth of Hamilton has been steady and substantial, and, owing to its remarkable industrial development, it has come to be called "the Birmingham of Canada." This development is largely due to the use of electrical energy generated by water-power, in regard to which Hamilton stands first among Canadian cities. The electricity has not, however, been obtained from Niagara Falls, but from De Cew Falls, 55 m. S.E. of the city. The entire electrical railway system, the lighting of the city, and the majority of the factories are operated by this power. Among the manufacturing interests of Hamilton are varied, and some of the establishments are of vast size, employing many thousands of hands each, such as the International Harvester Co. and the Canadian Westinghouse Co. In addition Hamilton is the centre of one of the finest fruit-growing districts on the continent, and its opening market is a remarkable sight. The municipal matters are managed by a mayor and board of aldermen. Six steam railroads and three electric radial roads afford Hamilton ample facilities for transportation by land, while during the season of navigation...
John Hamilton, an ancestor of Lord Belhaven, and now belong to Lord Ruthven. About 2 m. S.W. of Hamilton, within the western High Park, are the falls on the precipitous rock 200 ft. in height, the foot of which is washed by the Avon, standing on the site of an ancient farm, which was granted to Sir Walter FitzGilbert Hamilton, the son of the founder of the family, in return for the fealty. Near it is the noble chase of the first century, the ancient oaks, the remains of the Caledonian Forest, where are still preserved some of the original breed of wild deer. Opposite Cadzow Castle, in the eastern High Park, on the right bank of the Avon, is Chatelherault, consisting of stables and offices, andimitating in outline the palace of that name in France.

HAMILTON—HAMIRPUR,
a number of steamboat lines supply daily services to Toronto and other lake ports. Entrance into the broad bay is obtained through a short canal intersecting Burlington Beach, which is crossed by two swing bridges, whereof one—that of the Grand Trunk railway—is among the largest of its kind in the world. Burlington Beach is lined with cottages occupied by the city residents during the hot summer months. Hamilton is rich in popular residence, and contains a large number of schools, all of which have been well provided for, and the training at the public grammar school, the normal college, the collegiate institute, model school and more than a score of public schools, for the most part housed in handsome stone and brick buildings. There are four hospitals, and the asylum for the insane is the largest in Canada. There is an excellent public library, and in the same building with it a good art school. Hamilton boasts of a number of parks, Dundurn Castle Park, containing several interesting relics of the war of 1812, being the finest, and, as it is practically within the city limits, it is a great boon to the people. Gore Park, in the centre of the city, is used for concerts, given by various bands, one of which has gained an international reputation. Since its incorporation in 1833 the history of Hamilton has shown continuous growth. In 1816 the population was 2846; in 1821, 10,428; in 1861, 19,096; in 1871, 26,880; in 1881, 36,661; in 1891, 48,959; and in 1901, 52,634. The Anglican bishop of Niagara has his seat here, and also a Roman Catholic bishop. Hamilton returns two members to the Provincial parliament and two to the Dominion.

HAMILTON, a municipal and police burgh of Lanarkshire, Scotland. Pop. (1891), 32,775; (1901), 32,775. It is situated about 1 m. from the junction of the Avon with the Clyde, 103 m. S.E. of Glasgow by road, and has stations on the Caledonian and North British railways. The town hall in the Scottish Baronial style has a clock-tower 130 ft. high, and the county buildings are in the Grecian style. Among the subjects of antiquarian interest are Queenzie Neuk, the spot where Queen Mary rested on her journey to Langside, the old steeple and pillory built in the reign of Charles I., the Mote Hill, the old Runic cross, and the carved gateway in the palace style. In the churchyard there is a monument to four coventancers who suffered at Edinburgh, on the 7th of December 1600, whose heads were buried here. Among the industries are manufactures of cotton, lace and embroidered muslins, and carriage-building, and there are also large market gardens, the district being famed especially for its apples, and some dairy-farming; but the prosperity of the town depends chiefly upon the coal and ironstone of the surrounding country, which is the richest mineral field in Scotland. Hamilton originated in the 13th century under the patronage of the lords of Hamilton, who received a burgh of barony in 1456 and a royal burgh in 1548. The latter rights were afterwards surrendered and it was made the chief burgh of the regality and dukedom of Hamilton in 1668, the third marquess having been created duke in 1643. It unites with Airdrie, Falkirk, Lanark and Linlithgow to form the Falkirk district of burghs, which returns one member to parliament.

Immediately east of the town is Hamilton palace, the seat of the duke of Hamilton and Brandon, premier peer of Scotland. It occupies most of the site of the original burgh of Netherton. The first mansion was erected at the end of the 16th century and rebuilt about 1710, to be succeeded in 1822-1829 by the present palace, a specimen of the enriched Corinthian architecture, with a projecting plain portico after the style of the temple of Jupiter Stator at Rome, 204 ft. in length and 60 ft. in height. Each of the twelve pillars of the portico is a single block of stone, quarried at Dalserf, midway between Hamilton and Lanark, and required thirty horses to draw it to its site. The interior is richly decorated and once contained the tapestries to the paintings in Scotland, but most of them, together with the Hamilton and Brandon collection of pictures, were removed to the Royal Scottish Academy in 1882. Within the grounds, which comprise nearly 1500 acres, is the mausoleum erected by the 10th duke, a structure resembling in general appearance the moon and canal with a circular building springing from a square base, and enclosing a decorated octagonal chapel, the door of which is a copy in bronze of Giberti's gates at Florence. At Bannercull, 1 m. S.E. of the town, may be seen a picturesque and romantic glen, which was once the site of steep banks of the Avon. Their quaint shrubbery and old-fashioned setting render them attractive. They were planned in 1593 by...
HAMITIC RACES AND LANGUAGES

The district has an area of 2,289 sq. m., and encloses the native states of Sarila, Jigni and Bhat, besides portions of Charkhari and Garrauli. Hamirpur forms part of the great plain of Bundelkhand, which stretches from the banks of the Jumna to the central Vindhyan plateau. The district is in shape an irregular parallelogram, with a general slope northward from the low hills on the southern boundary. The scenery is rendered picturesque by the artificial lakes of Mahoba. These magnificent reservoirs were constructed by the Chandel rajas before the Mahommedan conquest. The drainage and as sheets of ornamental water. Many of them enclose cisterns or peninsulas, crowned by the ruins of granite temples, exquisitely carved and decorated. From the base of this hill and lake country the general plain of the district spreads northward in an arid and treeless level towards the broken banks of the rivers. Of these the principal are the Betwa and its tributary the Dhasan, both of which are unnavigable. There is little waste land, except in the ravines by the river sides. The deep black soil of Bundelkhand, known as mār, retains the moisture under a dried and rifted surface. The maize and the produce is grain of various sorts, the most important being grams. Cotton is also a valuable crop. Agriculture suffers much from the spread of the kōns grass, a noxious weed which overruns the fields and is found to be almost inedicable wherever it has once obtained a footing. Droughts and famine are unhappily common. The climate is dry and hot, owing to the absence of shade and the barrenness of soil, except in the neighbourhood of the Mahoba lakes, which cool and moisten the atmosphere.

In 1901 the pop. was 458,542, showing a decrease of 11% in the decade, due to the famine of 1895-1897. Export trade is chiefly in agricultural produce and cotton cloth. Rath is the principal commercial centre. The Midland branch of the Great Indian Peninsula railway passes through the south of the district.

From the 9th to the 12th century this district was the centre of the Chandel kingdom, with its capital at Mahoba. The rajas adorned the town with many splendid edifices, remains of which still exist, besides constructing the noble artificial lakes already described. At the end of the 12th century Mahoba fell into the hands of the Musulmans. In 1680 the district was conquered by Chhatar Sal, the hero of the Bundelas, who assigned at his death one-third of his dominions to his ally the peshwa of the Marathas. Until Bundelkhand became British territory in 1803 there was constant warfare between the Bundela princes and the Maratha chieftains. On the outbreak of the Mutiny in 1857, Hamirpur was the scene of a fierce rebellion, and all the principal towns were plundered by the surrounding chiefs. After a short period of desultory guerrilla warfare the rebels were effectually quelled and the work of reorganisation began. The district has since been subject to cycles of varying agricultural prosperity.

HAMITIC RACES AND LANGUAGES. The questions involved in a consideration of Hamitic races and Hamitic languages are independent of one another and call for separate treatment.

I. Hamitic Races. — The term Hamitic as applied to race is not only extremely vague but has been much abused by anthropological writers. Of the few who have attempted a precise definition the most prominent is Sergi, and his classification may be taken as representing one point of view with regard to this difficult question.

Sergi considers the Hamites, using the term in the racial sense, as a branch of his “Mediterranean Race”; and divides them as follows:

1. Eastern Branch —
(a) Ancient and Modern Egyptian (excluding the Arabs).
(b) Nubia, Beja.
(c) Abyssinians.
(d) Galla, Danakil, Somali.

With regard to this classification the following conclusions may be regarded as comparatively certain: that the members of groups c, e, and f of the first branch appear to be closely inter-connected by both speech and blood, and that the Beja, Nubians, and Godbars or Abyssinians in the south have absorbed a certain amount of Galla blood, but the majority are Semitic or Semitico-Negrid. The Beja, Nubians, and Godbars are the remnants of the Ancient Egyptians and the Beja are still a matter of doubt, and the relation of these groups to each other is still controversial. Sergi, it is true, arguing from physical data believes that a close connexion exists; but the data are not illumined by any satisfactory general or specific connexion. It may well be doubted. His “Northern Branch” corresponds with the more satisfactory term “Libyan Race,” represented in fair purity by the Beja, and, mixed with Negro elements, by the Fula and Tibbu. This Libyan race is distinctively a white race, with dark curly hair; the Eastern Hamites are equally distinctively a brown people with frizzy hair. If, as Sergi believes, these brown people are themselves a race, and not a cross between white and black in varying proportions, they are found in their greatest purity among the Somali and Galla, and mixed with Bantu blood among the Ba-Hima (Wahuma) and Watussi. The Masai seem to be as much Nilotic Negro as Hamite or Semite. The Gal and the Hamites of the southern portion of Abyssinia, and it is not unlikely that the Beja are very early Semitic immigrants with an aboriginal Negro mixture. It is also possible that they and the Ancient Egyptians may contain a Bantu element. The Nubians appear akin to the Egyptians but with a strong Negroid element.

To return to Sergi’s two branches, besides the differences in skin colour and hair-texture there is also a cultural and linguistic importance. The Eastern Hamites are essentially a pastoral people and therefore nomadic or semi-nomadic; the Berbers, who, as above said, are the purest representatives of the Libyans, are agricultural. The Beja and the Hamites are the pastoral of the Eastern Hamites, and it is in this connexion that the Beja and Hamites will be dealt with in the following paragraphs. It is not said that the Hamites are a more complete people, and Sergi’s group of Semitic Hamites is a group of Semitic speech.

It would seem therefore that, while sufficient data have not been collected to decide whether, on the evidence of exact anthropological measurements, the Libyans are connected racially with the Eastern Hamites, the testimony derived from broad “descriptive characteristics” and general culture is against such a connection. To regard the Libyans as Hamites solely on the ground that the languages spoken by the two groups show affinities would be rash and might be as false as to aver that the present-day Hungarians are Mongolians because Magyar is an Asianic tongue. Regarding the present status of the scholarship it would be safer therefore to restrict the term “Hamites” to Sergi’s first group; and call the second by the name “Libyans.” The difficult question of the origin of the archaic Egyptians is discussed elsewhere.

As to the question whether the Hamites in this restricted sense are a definite race or a blend, no discussion can, in view of the paucity of evidence, as yet lead to a satisfactory conclusion, but it might perhaps be a good thing to further researches may possibly connect them with the Dravidian peoples of India. It is sufficient for present purposes that the term Hamite, using it as coextensive with Sergi’s Eastern Hamite, has a definite connotation. By the term is meant a brown people with frizzy hair, of lean and sinewy physique, with slender but muscular arms and legs, a thin straight or even aquiline nose with delicate nostrils, thin lips and no trace of prognathism. (T. A. J.)

II. Hamitic Languages. — The whole north of Africa was once inhabited by tribes of the Caucasian race, speaking languages which are now generally called, after Genesis x, Hamitic, a term introduced principally by Friedrich Müller. The linguistic coherence of that race has been broken up especially by the intrusion of Arabs, whose language has exercised a powerful influence on all those nations. This is particularly true of the distance over which these tribes were spread, have made those languages diverge more widely than do the various tongues of the Indo-European stock, but still their affinity can easily be traced by the linguist, and is, perhaps, greater than the corresponding anthropologic similarity between the white Libyan, red Galla and swarthy Somali. The relationship of these languages to Semitic has long been noticed, but was at first taken for descent from Semitic (cf. the name Syro-Arabian) proposed by Prichard. Now linguists are agreed that the
and Beja are the best-preserved types, and the latter especially may be called the Sanskrit of Hamitic. The other Cushitic tongues exhibit increasing agglutinative tendencies the farther we go south, although the archaic heads are found even in Somalian (Gallal), the isolated High Cushitic tongues (originally branch off from a stock common with Gallal and Somalian) diverge most strongly from the original type. Already in the South Arabian Agasa are full of very peculiar developments; the Hamitic character of the Síd(oma) languages can be traced only by lengthy comparisons. The simple and pretty (Hausa) language, the commercial language of the whole North (among the Senussi, Gerenchr, for example), has often-raised question of some (very remote) relationship between Hamitic and the great Bantu family is still undecided; more doubtful is that with the interesting Ful (a) language in the western Sudan, but a relationship with the Nilotic branch of negro languages is suggested by some. e.g., Nuba, have borrowed some words from neighboring Hamitic peoples). The development of a grammatical gender, this principal characteristic of Semito-Hamitic, in Bari and Masai, may be traced back through the Galla, and it is likely that the phenomenon in Hottentots does not justify the attempt often made to classify this with Hamitic.

3. Ancient Egyptian, as we have seen, does not form the connecting link between Libyan and Cushitic which its geographical position would lead us to expect. It represents a third independent branch, or rather a second one, Libyan and Cushitic forming one branch, Ancient Egyptian the third branch. (The investigations of Rochemont in Mémoires de la société de linguistique de Paris, 1873; elementary) are less due to original relationship than to the general better preservation of the northern idioms (see above). Frequent attempts to detach Egyptian from Hamitic and to attribute it to a Semitic immigration later than that of the other Hamites cannot be proved. Egyptian is, in many respects, more remote from Semitic than the Libyco-Berber immigration, being more than the types of its sister branch, having lost the most characteristic verbal inflection (the Hamito-Semitic imperfect), forming the nominal plural in its own peculiar fashion, &c.

The advantage of Egyptian, that it is represented in texts of 3000 B.C., while the sister tongues exist only in forms 5000 years later, allows us, e.g. to trace the Semitic principle of triliteral roots more clearly in Egyptian; but still the latter tongue is hardly more characteristic than a local or nearer Semitic than Beja or Kala &c. All this is said principally of the grammar. Of the vocabulary it must not be forgotten that none of the Hamitic tongues remained unchanged after the tribes of the northern coast of the Red Sea and the Emirates and Semites, say 4000 or 6000 B.C. Repeated Semitic immigrations and influences have brought so many layers of loan-words that it is questionable if any modern Hamitic language has now more than the purest Arabian of the Yemen; for this reason it is more due to original affinity, which come from pre-Christian immigrations, which from later influences, are difficult questions not yet faced by science; e.g. the half-affected sibilant is a product of primitive Hamito-Semitic kinship, but they are probably only a gift of some Arab invasion, prehistoric for us. Arab tribes seem to have repeatedly swept over the whole area of the Hamites, long before the time of Mahomet, and to have left deep impressions on races and languages, but none of these migrations stands in the full light of history (not even that of the Gez tribes of Abyssinia). Egyptian exhibits constant influences from its Canaanite neighbours; it is cumbered with such loan-words already in 3000 B.C.; new affixes can be traced, especially c. 1600. (The Semitic influences on Libyan are, however, very slight, inferior to the Latin.) To its Hamitic roots (forming over 50% of the whole) go most of its formation in detail, for which the works of Reinisch and Basset have merely built a basis.

HAMLET, the hero of Shakespeare's tragedy, a striking figure in Scandinavian romance. The chief authority for the legend of Hamlet is Saxo Grammaticus, who devotes to it parts of the third and fourth books of his Historia Danica, written at the beginning of the 13th century. It is supposed that the story of Hamlet, Amluth: or Amlofi, was contained in the lost Skjaldunga saga, but it is no longer a question of determining whether Saxo derived his information in this case from oral or written sources. The close parallels between the
tale of Hamlet and the English romances of Havelok, Horn and Bevis of Hampton make it not unlikely that Hamlet is of British rather than of Scandinavian origin. His name does in fact occur in the Irish Annals of the Four Masters (ed. O’Donovan, 1851) in a stanza attributed to the Irish Queen Gormlaith, who laments the death of her husband, Niall Glundubh, at the hands of Amhlaidh in 919 at the battle of Ath-Chlath. The slayer of Niall Glundubh is by other authorities stated to have been Sihtric. Now Sihtric was the father of that Olaf or Anlaf Cuaran who was the prototype of the English Havelok, but nowhere else does he receive the nickname of Amhlaidh. If Amhlaidh may be shown to be identified with Sihtric, who first went to Dublin in 888, the relations between the tales of Havelok and Hamlet are readily explicable, since nothing was more likely than that the exploits of father and son should be confounded (see Havelok). But, whoever the historic Hamlet may have been, it is quite certain that much was added that was extraneous to Scandinavian tradition. Later in the 10th century there is evidence of the existence of an Icelandic saga of Amlöð or Amleth in a passage from the poet Snaebjørn in the second part of the prose Eddas. According to this saga, Hamlet’s history is as follows:

In the days of Rórik, king of Denmark, Gervendill was governor of Jutland, and was succeeded by his sons Horvendill and Feng. Horvendill, on his return from a Viking expedition in which he had slain Koll, king of Norway, married Gerutha, Rórik’s daughter, who bore him a son Amleth. But Feng, out of jealousy, murdered Horvendill, and persuaded Gerutha to become his wife, on the plea that he had committed the crime for no other reason than to avenge her of a husband by whom she had been hated. Amleth, afraid of sharing his father’s fate, pretended to be imbecile, but the suspicion of Feng put him to various tests which are related in detail. Among other things they sought to entangle him with a young girl, his foster-sister, but his cunning saved him. When, however, Amleth slew the eavesdropper hidden, like Polonius, in his mother’s room, and destroyed all trace of the deed, Feng was assured that the young man’s madness was feigned. Accordingly he despatched him to England in company with two attendants, who bore a letter enjoining the king of the country to put him to death. Amleth surmised the purport of their instructions, and secretly altered the message on their wooden tablets to the effect that the king should put the attendants to death and give Amleth his daughter in marriage. After marrying the princess Amleth returned at the end of a year to Denmark. Of the wealth he had accumulated he took with him only certain hollow sticks filled with gold. He arrived in time for a funeral feast, held to celebrate his supposed death. During the feast he plied the courtiers with wine, and executed his vengeance during their drunken sleep by fastening down over them the woollen hangings of the ball with pegs he had sharpened during his feigned madness, and then setting fire to the palace. Feng he slew with his own sword. After a long harangue to the people he was proclaimed king. Returning to England for his wife he found that his father-in-law and Feng had been pledged each to avenge the other’s death. The English king, unwilling personally to carry out his pledge, sent Amleth as proxy woeer for the hand of a terrible Scottish queen Hermuthruda, who had put all former woesers to death, but fell in love with Amleth. On his return to England his first wife, whose love proved stronger than her threat, told him of her father’s intended revenge. In the battle which followed Amleth won the day by setting up the dead men of the day before with stakes, and thus terrifying the enemy. He then returned with his two wives to Jutland, where he had to encounter the enmity of Wigle, Rorik’s successor. He was slain in a battle against Wigle, and Hermuthruda, although she had engaged to die with him, married the victor.

The other Scandinavian versions of the tale are: the Hröðsaga Kraka, where the brothers Helgi and Hrhoar take the place of the hero; the tale of Harald and Halfdan, as related in the 7th book of Saxo Grammaticus; the modern Icelandic Amblesa Saga, a romance of the earliest MS. of which dates from the 17th century; and the folk-tale of Brján, which was put in writing in 1707. Helgi and Hrhoar, like Harald and Halfdan, avenge their father’s death on their uncle by burning him in his palace. Harald and Halfdan escape after their father’s death by being brought up, with dogs’ names, in a hollow oak, and subsequently by feigned madness; and in the case of the other brothers there are traces of a similar motive, since the boys are called by dogs’ names. The methods of Hamlet’s madness, as related by Saxo, showing itself between the covenants of ynanthropy. In the Amblesa Saga, which is an uncollatable version, in part derived from Saxo’s version, there are, besides romantic additions, some traits which point to an earlier version of the tale. Saxo Grammaticus was certainly familiar with the Latin historians, and it is most probable that, recognizing the similarity between the northern Hamlet legend and the classical tale of Lucius Junius Brutus as told by Livy, by Valerius Maximus, and by Dionysius of Halicarnassus (with which he was probably acquainted through a Latin epitome), he deliberately added cited variations from the classical story. The incident of the gold-filled sticks could hardly appear fortuitously in both, and a comparison of the harangues of Amleth (Saxo, Book iv.) and of Brutus (Dionysius iv. 77) shows marked similarities. In both tales the usurping uncle is ultimately succeeded by the nephew who has escaped notice during his youth by a feigned madness. But the parts played by the personages who in Shakespeare became Ophelia and Polonius, the method of revenge, and the whole narrative of Amleth’s adventure in England, have no parallels in the Latin story.

Dr. O. L. Jiriczek first pointed out the striking similarities existing between the story of Amleth in Saxo and the other northern versions, and that of Kei Chosro in the Shahnamah (Book of the King) of the Persian poet Firdausi. The comparison was carried farther by R. Zemker (Bewe Amletvius, pp. 207-268, Berlin and Leipzig, 1904), who even concluded that the northern saga rested on an earlier version of Firdausi’s story, in which indeed nearly all the individual elements of the various northern versions are to be found. Further resemblances exist in the Amblesa Saga with the tales of Bellerophon, of Heracles, and of Servius Tullius. That Oriental tales through Byzantine and Arabic channels did find their way to the west is well known, and there is nothing very surprising in their being attached to a local hero.

The tale of Hamlet’s adventures in Britain forms an episode so distinct that it was at one time referred to a separate hero. The traitorous letter, the purport of which is changed by Hermuthruda, occurs in the popular Dit de l’empereur Constant, and in Arabian and Indian tales. Hermuthruda’s cruelty to her wooers is common in northern and German mythology, and close

1 Printed in Forsmålar Sögur Norrlanda (vol. i. Copenhagen, 1829), analysed by F. Detter in Zeitschr. für deutsches Altertum (vol. 36, Berlin, 1892).
2 The English translation and with other texts germane to the subject by J. Gollancz (Hamlet in Icelandic, London, 1898).
3 Professor I. Gollancz points out (p. lxx.) that Brján is a variation of the Irish Brian, that the relations between Ireland and the Norsemen were very close, and that, curiously enough, Brian Borúla was the hero of that very battle of Clontarf (1014) where the device (which occurs in Havelok and Hamlet) of blinding the enemy by tying the wounded to stakes to represent active soldiers was used.
4 "Hamlet in Iran," in Zeitschrift des Vereins für Volkswunde, x. (Berlin, 1900).
parallels are afforded by Thrytho, the terrible bride of Offa I., who figures in Beowulf, and by Brunhilda in the Nibelungenlied.

The story of Hamlet was known to the Elizabethans in François de Belleforest's Histoires tragiques (1559), and found its supreme expression in Shakespeare's tragedy. That as early as 1587 or 1589 Hamlet had appeared on the English stage is shown by Nash's preface to Greene's Menaphon: "He will afford you whole Hamlets, I should say, handfuls of tragical speeches." The Shakespearian Hamlet owes, however, little but the outline of his story to Saxo. In character he is diametrically opposed to his prototype. Amleth's madness was certainly altogether feigned; he prepared his vengeance a year beforehand, and carried it out deliberately and ruthlessly at every point. His riddling speech has little more than an outward similarity to the words of Hamlet, who resembles him, however, in his disconcerting penetration into his enemies' plans. For a discussion of Shakespeare's play and its immediate sources see Shakespeare.

HAMLEY, SIR EDWARD BRUCE (1824-1893), British general and military writer, youngest son of Vice-Admiral William Hamley, was born on the 27th of April 1824 at Bodmin, Cornwall, and entered the Royal Artillery in 1843. He was promoted captain in 1850, and in 1851 went to Gibraltar, where he commenced his literary career by contributing articles to magazines. He served throughout the Crimean campaign as aide-de-camp to the Duke of Wellington, and at the battle of Inkerman was engaged in the siege and reduction of Sevastopol, and was detailed to take the field in all the operations with distinction, and becoming successively major and lieutenant-colonel by brevet. He also received the C.B. and French and Turkish orders. During the war he contributed to Blackwood's Magazine an admirable account of the progress of the campaign, which was afterwards republished. The combination in Hamley of literary and military ability secured for him in 1859 the professorship of military history at the new Staff College at Sandhurst, from which in 1866 he went to the council of military education, returning in 1870 to the Staff College as commandant. From 1870 to 1881 he was British commissioner successively for the delimitation of the frontiers of Turkey and Bulgaria, Turkey in Asia and Russia, and Turkey and Greece, and was rewarded with the K.C.M.G. Promoted colonel in 1863, he became a lieutenant-general in 1882, when he commanded the 2nd division of the expedition to Egypt under Lord Wolseley, and led his troops in the battle of Tell-el-Kebir, for which he received the K.C.B., the thanks of parliament, and 2nd class of Osmanieh. Hamley considered that his services in Egypt had been insufficiently recognized in Lord Wolseley's despatches, and expressed his indignation freely, but he had no sufficient ground for supposing that there was any intention to belittle his services. From 1885 until his death on the 12th of August 1893 he represented Birkenhead in parliament in the Conservative interest.

Hamley was a clever and versatile writer. His principal work, The Operations of War, published in 1867, became a text-book of military instruction. He published some pamphlets on national defence, was a frequent contributor to magazines, and the author of several novels, of which perhaps the best known is Lady Lee's Widowhood.

HAMLIN, HANNIBAL (1809-1891), vice-president of the United States (1861-1865), was born at Paris, Maine, on the 17th of August 1809. After studying in Hebron Academy, he conducted his father's farm for a time, became schoolmaster, and later managed a weekly newspaper at Paris. He then studied law, was admitted to the bar in 1833, and rapidly acquired a reputation as an able lawyer and a good public speaker. Entering politics as an anti-slavery Democrat, he was a member of the House of Representatives in 1836-1840, serving as its presiding officer during the last four years. He was a representative in Congress from 1843 to 1847, and a member of the United States Senate from 1848 to 1856. From the very beginning of his service in Congress he was prominent as an opponent of the extension of slavery; he was a conspicuous supporter of the Wilmot Proviso, spoke against the Compromise Measures of 1850, and in 1856, chiefly because of the passage in 1854 of the Kansas-Nebraska Bill, which repealed the Missouri Compromise, and his party's endorsement of that repeal at the Cincinnati Convention two years later, he withdrew from the Democrats and joined the newly organized Republican party. The Republicans of Maine nominated him for governor in the same year, and having carried the election by a large majority he was inaugurated in this office on the 8th of January 1857. In the latter part of February, however, he resigned the governorship, and was again a member of the Senate from 1857 to January 1861. From 1861 to 1865, during the Civil War, he was Vice-President of the United States. While in this office he was one of the chief advisers of President Lincoln, and urged both the Emancipation Proclamation and the arming of the negroes. After the war he again served in the Senate (1869-1881), was minister to Spain (1881-1883), and then retired from public life. He died at Bangor, Maine, on the 4th of July 1891.

HAMMAD AR-RAWIYA, town, in Germany, in the Prussian province of Westphalia, on the Linge, 19 m. by rail N.E. from Dortmund on the main line Cologne-Hanover. Pop. (1905) 38,430. It is surrounded by pleasant promenades occupying the site of the former engirling fortifications. The principal buildings are four Roman Catholic and three Evangelical churches, several schools and an infirmary. The town is flourishing and rapidly increasing, and possesses very extensive wire factories (in connexion with which there are puddling and rolling works), machine works, and manufactories of gloves, baskets, leather, starch, chemicals, varnish, oil and beer. Near the town are some thermal baths.

Hamm, which became a town about the end of the 12th century, was originally the capital of the countship of Mark, and was fortified in 1226. It became a member of the Hanseatic League. In 1614 it was besieged by the Dutch, and it was several times taken and retaken during the Thirty Years' War. In 1666 it came into the possession of Brandenburg. In 1761 and 1762 it was bombarded by the French, and in 1793 its fortifications were dismantled.

HAMMER—HAMMERFEST

HAMMER, FRIEDRICH JULIUS (1810-1862), German poet, was born on the 7th of June 1810 at Dresden. In 1831 he went to Leipzig to study law, but devoted himself mainly to the shape of hand-guns, and became a lawyer. Returning to Dresden in 1834, he became a lawyer and poet. In 1837 he published "Das kleine Freisstück," and in 1838 at Leipzig he founded a literary society. In 1841 he published "Der Kaiser von der Mundwurzel," and in 1851 his "Phantastische Geschichte," which is a collection of his poems. His most popular works are "Der Kaiser von der Mundwurzel," "Phantastische Geschichte," and "Das kleine Freisstück." His poems are characterized by their descriptive power and their vivid imagery.

The origin of the word "hammer-cloth," an ornamental cloth covering the box-seat on a state-coach, has been often explained. It was applied to the hammer from the tools carried in the box-seat by the coachman for repairs, &c. The New English Dictionary points out that while the word occurs as early as 1465, the use of a box-seat is not known before the 17th century. Other suggestions are that it is a corruption of "hamper-cloth," or of "hammer-cloth," which is used in this sense, probably owing to a mistake.

Neither of these supposed corruptions helps very much. Skeat connects the word with a Dutch word hemel, meaning a canopy. In the name of the bird, the yellow-hammer, the latter part seems to be "hamer." This appears in the German name, Hemelring, and the word probably means the "chirper," cf. the Ger. zimmem, to call, lament.

HAMMERBEAM ROOF, in architecture, the name given to a Gothic open timber roof, of which the finest example is that over Westminster Hall (1355-1359). In order to give greater height in the centre, the ordinary tie beam is cut through, and the portions remaining, known as hammerbeams, are supported by curved braces from the wall; in Westminster Hall, in order to give greater strength to the framing, a large arched piece of timber is carried across the hall, rising from the bottom of the wall piece to the centre of the collar beam, the latter being also supported by curved braces.

The span of Westminster Hall is 68 ft. 4 in., and the opening between the ends of the hammerbeams 25 ft. 6 in. The height from the paving of the hall to the hammerbeam is 40 ft., and to the underside of the collar beam 63 ft. 6 in., so that an additional height in the centre of 23 ft. 6 in. has been gained. Other important examples of hammerbeam roofs exist over the halls of Hampton Court and Eltham palaces, and there are numerous examples of smaller dimensions in churches throughout England and particularly in the eastern counties. The ends of the hammerbeams are usually decorated with wings and holding shields; the curved braces and beams are richly moulded, and the spandrels in the larger examples filled in with tracery, as in Westminster Hall. Sometimes, but rarely, the collar beam is similarly treated, or cut through and supported by additional curved braces, as in the hall of the Middle Temple, London.

HAMMERFEST, the most northern town in Europe. Pop. (1900) 2300. It is situated on an island (Kvalö) off the N.W. coast of Norway, in Finnmarken amt (county), in 70° 40' 11" N., the latitude being the extreme north of Alaska. Its position, together with the best illustration of the influence of the north-eastward Atlantic drift, the mean annual temperature being 36° F. (January 31°, July 57°). Hammerfest is 774 m. by sea N.E. of Trondheim, and 78 S.W. from the North Cape. The character of this coast differs from the southern, the islands being fewer and larger, and of table shape. The narrow strait Strömmen separates Kvalö from the larger Seiland, whose snow-covered hills with several glaciers rise above 3500 ft., while an insular rampart of mountains, Sorø, protects the Strait and harbour from the open sea. The town is timber-built and modern; and the Protestant church, town-hall, and schools were all rebuilt after fire in 1860. There is also a Roman Catholic church. The sun does not set at Hammerfest from the 13th of May to the 20th of July. This is the busy season of the townsfolk. Vessels set out to the fisheries, as far as Spitsbergen and the Kara Sea; and trade is brisk, not only Norwegian and Danish but British, German and particularly Russian vessels engaging in it. Cod-liver oil and salted fish are exported with reindeer-skins, fox-skins and eiderdown; and coal and salt for curing are imported. In the spring the great herds of tame reindeer, driven by the townspeople from the end of the cliffs to the summer pastures of Seiland; towards winter they are called home again. From the 18th of November to the 23rd of January the sun is not seen, and the enforced quiet of winter prevails. Electric light was introduced in the town in 1891. On the Fuglenes or Birds' Cape, which protects the harbour on the north, there stands a column with an inscription in Norse and Latin, stating that Hammerfest was one of the stations of the
HAMMER-KOP—HAMMERSMITH

expedition for the measurement of the arc of the meridian in 1816–1832. Nor is this its only association with science; for it was one of the spots chosen by Sir Edward Sabine for his series of pendulum experiments in 1823. The ascent of the Sadlen or the Tyven in the neighbourhood is usually undertaken by travellers for the view of the barren, snow-clad Arctic landscape, the bluff indented coast, and the vast expanse of the Arctic Ocean. In Vienna, Hammersmith

HAMMER-KOP, or HAMMEKOP, an African bird, which has been regarded as a stork and as a heron, the Scopus umbretto of ornithologists, called the "Umbre" by T. Pennant, now placed in a separate family Scopidae between the herons and storks. It was discovered by M. Adanson, the French traveller, in Senegal about the middle of the 19th century, and was described by M. J. Brisson in 1774. It has since been found to inhabit nearly the whole of Africa and Madagascar, and is the "hammerkop" (hammekop) of the Cape colonists. Though not larger than a raven, it builds an enormous nest, some six feet in diameter, with a flat-topped roof and a small hole for entrance and exit, and placed either on a tree or a rocky ledge. The bird, of an almost uniform brown colour, slightly glossed with purple and its tail barred with black, has a long terminal crest, generally borne horizontally, so as to give rise to its common name. It is somewhat sluggish by day, but displays much activity at dusk, when it will go through a series of strange performances. (A. N.)

HAMMER-PURGSTALL, JOSEPH, FREIHERR VON (1774–1859), Austrian orientalist, was born at Graz on the 4th of June 1774, the son of Joseph Johann von Hammer, and received his early education at Vienna. In 1796 he became a military engineer in the Imperial service, and in 1799 he was appointed to a position in the Austrian embassy in Constantinople, and in this capacity he took part in the expedition under Admiral Sir William Sidney Smith and General Sir John Hely Hutchinson against the French. In 1807 he returned home from the East, after which he was made a privy councillor, and, on inheriting in 1835 the estates of the countess Purgstall in Styria, was given the title of "freiherr." In 1847 he was elected president of the newly-founded academy, and he died at Vienna on the 23rd of November 1856.

For fifty years Hammer-Purgstall wrote incessantly on the most diverse subjects and published numerous texts and translations of Arabic, Persian and Turkish authors. It was natural that a scholar who traversed so large a field should lay himself open to the criticism of specialists, and he was severely handled by Friedrich Christian Diez (1794–1876), who, in his Unfug und Betrug (1819), devoted to him nearly 600 pages of abuse. Von Hammer-Purgstall did for Germany the same work that Sir William Jones (q.v.) did for England and Silvestre de Sacy for France. His name is always associated with his contemporaries, Edward William Lane, with whom he came into friendly conflict on the subject of the origin of The Thousand and One Nights, an assiduous worker, and in spite of many faults did more for oriental studies than most of his critics put together.

Von Hammer's principal work was his Geschichte des osmanischen Reiches (10 vols., Pesth, 1827–1835). Another edition of this was published at Pesth in 1834–1835, and it has been translated into French by L. Latymer, and, in his own time, into Constantopolis and of the Bosporos (1822); Sur les origines russes (St Petersburg, 1825); Geschichte der osmanischen Dichtkunst (1836); Geschichte der Goldenen Horde in Kipishak (1840); Geschichte der Chane der Kreim (1856); and an unfinished Littératuregeschichte der Araber (1856–1866). His Geschichte der Assassinen (1818) has been translated into English by O. C. Wood (1835).

Texts and translations—El-Thaball, Arab. and Ger. (1820); El-Wanhaish, History of the Mongols, Arab. and Eng. (1806); El- Wazisf, Pers. and Ger. (1856); Schelbitzki's Rosenvon des Geheimnisses, Pers. and Ger. (1836); Ez- Zamakhresh, Goldene Denkmale, Pers. and Ger. (1836); Ez- Zemakhresh, Arab. and Ger. (1858); Ez-Hamnow, Das arab. Hohe Lied der Liebe, Arab. and Ger. (1854). Translations of—El-Mutanabbis's Poems; Ez-Rasmi's Account of his Embassy (1606); Contes inédits des 1001 nuits (1828). Besides these small and smaller works, Von Hammer contributed numerous essays and criticisms to the Fundgruben des Orients, which he edited; to the Journal asiatique; and to many other learned journals; above all to the Transactions of the "Akademie der Wissenschaften" of Vienna, of which he was mainly the founder; and he translated Evliya Effendi's Travels in Europe, for the English Oriental Translation Fund. For a fuller list of his works, which amount in all to over 300, see the Compendium des der Acad. des Inschr. et des Belles-Lettres (1857). See also Schlottmann, Joseph von Hammer-Purgstall (Zurich, 1857).

HAMMERSMITH, a western metropolitan borough of London, England, bounded E. by Kensington and S. by Fulham and the Thames, and extending N. and W. to the boundary of the county of London. Pop. (1001) 117,250. The name appears in the early forms of Hermodesweode and Hammersweod; the derivation is probably from the Anglo-Saxon, signifying the place with a haven (hythe). Hammersmith is mentioned with Fulham as a winter camp of Danish invaders in 879, when they occupied the island of Hame, which may be identified with Chiswick Eyot. Hammersmith consists of residential streets of various classes. There are many good houses in the districts of Brook Green in the south-east, and Ravenscourt Park and Starch Green in the west. Shepherd's Bush in the east is a populous and poorer quarter. Boat-building yards, lead-mills, oil mills, distilleries, coach factories, motor works, and other industrial establishments are found along the river and elsewhere in the borough. The main thoroughfares are Uxbridge Road and Goldhawk Road, from Acton on the west, converging at Shepherd's Bush and continuing towards Notting Hill; King Street from Chiswick on the south-west, continued as Hammersmith Broadway and Road to Kensington Road; Bridge Road from Hammersmith Bridge over the Thames, and Fulham Palace Road from Fulham, converging at the Broadway. Old Hammersmith Bridge, designed by Tierney and Stark (1804), was the earliest suspension bridge erected near London. This bridge was found insecure and replaced in 1884–1887. Until 1834 Hammersmith formed part of Fulham parish. Its church of St Paul was built as a chapel of ease to Fulham, and consecrated by Laud in 1631. The existing building dates from 1890. Among the old monuments preserved is that of Sir Nicholas Crispe (d. 1663), a prominent royalist during the civil wars and a benefactor of the parish. Schools and religious houses are numerous. St Paul's school is one of the principal public schools in England. It was founded in 1570 by John Colet, dean of St Paul's, under the shadow of the cathedral church. But it appears that Colet actually refounded and reorganized a school which had been attached to the cathedral of St Paul from very early times; the first mention of such a school dates from the early part of the 12th century (see an article in The Times, London, July 7, 1900, on the occasion of the celebration of the quatercentenary of Colet's foundation). The school was moved to its present site in Hammersmith Road in 1883. The number of foundation scholars, that is, the number for which Colet's endowment continued, was 879, the earliest surviving form of the miraculous draught. The total number of pupils is about 600. The school governors are appointed by the Mercers' Company (by which body the new site was acquired), and the universities of Oxford, Cambridge and London. Close to the school is St Paul's preparatory school, and at Brook Green is a girls' school in connexion with the main school. There are, besides, the Edward Latymer foundation school for boys (1624), part of the income of which is devoted to general charitable purposes; the Godolphin school, founded in the 16th century and remodelled as a grammar school in 1865; Nazareth House of Little Sisters of the Poor, the Convent of the Sacred Heart, and other convents. The town hall, the West London hospital with its post-graduate college, and Wormwood Scrubs prison are noteworthy buildings. Other institutions are the Hammersmith school of art and a Roman Catholic training college. Besides the picturesque Ravenscourt Park (31 acres) there are extensive recreation grounds in the north of the borough at Wormwood Scrubs (193 acres), and others of lesser extent. An important place of entertainment is Olympia, near Hammersmith Road and the Addison Road station on the West London railway, which includes a vast arena under a glass roof; while at Shepherd's Bush are the extensive grounds and buildings first occupied by the Franco-British Exhibition of 1908, including
a huge stadium for athletic displays. In the extreme north of the borough is the Kensal Green Roman Catholic cemetery, in which Cardinal Manning and many other prominent members of this faith are buried. In the neighbourhood of the Mall, bordering the river, are the house where Thomson wrote his poem “The Seasons,” and Kelmscott House, the residence of William Morris. The parliamentary borough of Hillingdon returns one member. The borough council consists of a mayor, 5 elected aldermen, and 30 councillors. Area, 2,286½ acres.

HAMMER-THROWING, a branch of field athletics which consists of hurling to the greatest possible distance an instrument with a heavy head and slender handle called the hammer. Throwing the hammer is in all probability of Keltic origin, as it has been popular in Ireland and Scotland for many centuries. The missile was, however, not a hammer, but the wheel of a chariot attached to a fixed axle, by which it was whirled around the head and cast for distance. Such a sport has probably been cultivated in the old Irish games, a large stone being substituted for the wheel at the beginning of the Christian era. In the Scottish highlands the missile took the form of a smith’s sledge-hammer, and in this form the sport became popular in England in early days. Edward II. is said to have fostered it, and Henry VIII. is known to have been proficient. At the beginning of the 19th century two standard hammers were generally recognized in Scotland, the heavy hammer, weighing about 21 lb, and the light hammer, weighing about 16 lb. These were in general use until about 1885, although the light hammer gradually attained the ascendancy. In this apparatus the hammer, although originally an ordinary blacksmith’s sledge with a handle about 3 ft. long, the form of the head was gradually modified until it acquired its present spherical shape, and the stiff wooden handle gave place to one of flexible whalebone about 3 in. in diameter. The Scottish style of throwing, which also obtained in America, was to stand on a mark, swing the hammer round the head several times and hurl it backwards over the shoulder, the length being measured from the mark made by the falling hammer to the nearest foot of the thrower, no run or follow being allowed. Such men as Donald Dinne, G. Davidson and Kenneth McRae threw the light hammer over 110 ft., and Dinnie’s record was 132 ft.8 in., made, however, from a raised mount. Meanwhile the English Amateur Athletic Association had early fixed the weight of the hammer at 16 lb, but the length of the handle and the run varied widely, the restrictions being few. Under these conditions S. S. Brown, of Oxford, made in 1873 a throw of 120 ft., which was considered extraordinary at the time. In 1875 the throw was made from a 7-ft. circle without run, head and handle of the missile weighing together exactly 16 lb. In 1887 the circle was enlarged to 9 ft. 9 in. 1889 the flexible metal was made. The throw was made after a few rapid revolutions of the body, which added an impetus that greatly added to the distance attained. It thus happened that the Scottish competitors at the English games, who clung to their standing style of throwing, were, although athletes of the very first class, repeatedly beaten; the result being that the Scottish association was forced to introduce the English rules. This was also the case in America, where the throw from the 7-ft. circle, any motions being allowed within it, was adopted in 1888, and still obtains. The American hammer is of metal; it consists of a circular body with two skeleton loops for the hands, the wire being joined to the head by means of a ball-bearing swivel. Thus the greatest mechanical advantage, that of having the entire weight of the missile at the end, as well as the least friction, is obtained. In England the Amateur Athletic Association in 1908 enacted that “the head and handle may be of any size, shape and material, provided that the complete implement shall not be more than 4 ft. and its weight not less than 16 lb. The competitor may assume any position he chooses, and use either one or both hands. All throws shall be made from a circle 7 ft. in diameter.” The modern hammer-thrower, if right-handed, begins by placing the head on the ground at his right side. He then lifts and swings it towards his head with increasing rapidity, his whole body finally revolving with outstretched arms twice, in some cases three times, as rapidly as possible, the hammer being released in the desired direction. During the “spinning,” or revolving of the body, the athlete must be constantly, “ahead of the hammer,” i.e. he must be drawing it after him with continually increased pressure up to the very moment of delivery. The muscles chiefly called into play are those of the shoulders, back and loins. The adoption of the hand-loops has given the thrower greater control over the hammer and has thus rendered the sport much less dangerous than it once was.

With a wooden handle the longest throw made in Great Britain from a 9-ft. circle was that of W. J. M. Barry in 1892, who won the championship in that year with a distance of 193 ft. 3 in. With the flexible hammer it is measured from the starting line to the point where the hammer is constantly carried by the arm. The record was held in 1909 by M. J. McGrath with 175 ft. 8 in., made in 1907; a Scottish amateur, T. K. Nicholson, held the British record of 169 ft. 8 in. The world’s record for throw from a 7-ft. circle was 172 ft. 9 in. by J. Flanagan in 1904 in America; the British record from 9-ft. circle being also held by Flanagan with a throw of 163 ft. 1 in. made in 1900. Flanagan’s Olympic record (London, 1908) was 170 ft. 43 in. See Athletics in the Badminton library: Athletes’ Guide in Spalding’s Athletic library; “Hammer-Throwing” in vol. xx. of Outing.

HAMMER-TOE, a painful condition in which a toe is rigidly bent and the salient angle on its upper aspect is constantly irritated by the boot. It is treated surgically, not as formerly by amputation of the toe, but the toe is made permanently to lie flat by the simple excision of the small digital joint. Even in extremely bad cases of hammer-toe the operation of resection of the head of the metatarsal phalanx is to be recommended rather than the amputation of the toe.

HAMMOCK, a bed or couch hung from each end. The word is said to have been derived from the hamack tree, the bark of which was used by the aboriginal natives of Brazil to form the nets, suspended from trees, in which they slept. The hammock may be of matting, skin or textiles, lined with cushions or filled with bedding. It is much used in hot climates.

HAMMOND, HENRY (1665–1660), English divine, was born at Chertsey in Surrey on the 18th of August 1665. He was educated at Eton and at Magdalen College, Oxford, becoming demy or scholar in 1681, and fellow in 1682. He took orders in 1689, and in 1683 in preaching before the court so won the approval of the earl of Leicester that he presented him to the living of Penshurst in Kent. In 1683 he was made archdeacon of Chichester. He was a member of the convocation of 1640, and was nominated one of the Westminster Assembly of divines. Instead of sitting at Westminster he took part in the unsuccessful rising at Turbridge in favour of King Charles I., and was obliged to flee in disguise to Oxford, then the royal headquarters. There he spent much of his time in writing, though he accompanied the king's court to Oxford and London and heard many public and private addresses by Rich. Vines, one of the parliamentary envoys. In his absence he was appointed canon of Christ Church and public orator of the university. These dignities he relinquished for a time in order to attend the king as chaplain during his captivity in the hands of the parliament. When Charles was deprived of all his loyal attendants at Christmas 1647, Hammond returned to Oxford and was made subdean of Christ Church, only, however, to be removed from all his offices by the parliamentary visitors, who imprisoned him for ten weeks. Afterwards he was permitted, though still under quasi-confinement, to retire to the house of Philip Warwick at Clapham in Bedfordshire. In 1650, having regained his full liberty, Hammond betook himself to the friendly mansion of Sir John Pakington, at Westwood, in Worcestershire, where he died on the 25th of April 1660, just on the eve of his preferment to the see of Worcester. Hammond was held in high esteem even by his opponents. He was handsome in person and benevolent in disposition. He was an excellent preacher; Charles I. pronounced him the most natural orator he had ever heard. His range of reading was extensive, and he was a most diligent student of the law.

His writings, published in 4 vols. fol. (1674–1684), consist for the most part of controversial sermons and tracts. The Angola-Catholic
HAMMOND, a city of Lake county, Indiana, U.S.A., about 18 m. S.E. of the business centre of Chicago, on the Grand Calumet river. Pop. (1890), 5428; (1900) 12,376, of whom 3138 were foreign-born; (1900, census) 25,729. In 1846 a settlement committed by no fewer than 186 men was made by approaching Chicago from the east, and several early belt lines. As far as its industries are concerned, it is a part of Chicago, to which it owes its rapid growth and its extensive manufacturing establishments, which include slaughtering and packing houses, iron and steel works, chemical works, piano, wagon and carriage factories, printing establishments, flour and starch mills, glue works, breweries and distilleries. In 1900 Hammond was the principal slaughtering and meat-packing centre of the state, but subsequently a large establishment removed from the city, and Hammond's success factor was 100, all industries decreased from $25,070,552 in 1900 to $7,671,203 in 1905; after 1905 there was renewed growth in the city's manufacturing interests. It has a good water-supply system which is owned by the city. Hammond was first settled about 1868, was named in honour of Abram A. Hammond (acting governor of the state in 1860-1861) and was chartered as a city in 1883.

HAMON, JEAN LOUIS (1821-1874), French painter, was born at Plouha on the 5th of May 1821. At an early age he was intended for the priesthood, and placed under the care of two brothers Lamennais, but his industry led him to become a painter finally triumphed over family opposition, and in 1840 he courageously left Plouha for Paris—his sole resources being a pension of five hundred francs, granted him for one year only by the municipality of his native town. At Paris Hamon received valuable counsels and encouragement from Delaroche and Gleyre, and in 1848 he made his appearance at the Salon with "Le Tombeau du Christ" (Musée de Marseille), and a decorative work, "Deusse de Porte." The works which he exhibited in 1849—"Une Affiche romaine," "L'Égalité au sérail," and "Perroquet faisant avec deux jeunes filles"—were bought by the brothers Lamennais, and Hamon was enabled to accept a place in the manufactory of Sévres, but an enamelled casket by his hand having attracted notice at the London International Exhibition of 1851, he received a medal, and, reinspired by success, left his post to try his chances again at the Salon of 1852. "La Comédie humaine," which he then exhibited, turned the tide of his fortune, and "Ma sœur n'y est pas" (purchased by the emperor) obtained for its author a third-class medal in 1853. At the Paris International Exhibition of 1855, when Hamon re-exhibited the casket of 1851, together with several vases and pictures of which "L'Amour et son troupeau," "Ce n'est pas moi," and "Une Gardeuse d'enfants" were the chief, he received a medal of the second class, and the ribbon of the legion of honour. In the following year he was absent in the East, but in 1857 he reappeared with "Boutique à quatre sous," "Papillon enchaîné," "Cantharide esclave," "Dévoués," &c., in all ten pictures; "L'Amour en visite" was contributed to the Salon of 1859, and "Vierge de Lesbos," "Tuette," "La Volière," "L'Écamotude" and "La Sour année" were all seen in 1861. Hamon now spent some time in Italy, chiefly at Capri, whence in 1864 he sent to Paris "L'Absinthe" and "Un Jour de fiançailles." The influence of Italy was also evident in "Les Muses à Pompéi," his sole contribution to the Salon of 1866, a work which enjoyed great popularity and was re-exhibited at the International Exhibition of 1867, together with "La Promenade" and six other pictures of previous years. His last work, "Le Triste Rivage," appeared at the Salon of 1873. It was painted at St Raphael, where Hamon had finally settled in a little house on the shores of the Mediterranean, close by Alphonse Karr's famous garden. In this house he died on the 29th of May 1874.

HAMPDEN, HENRY BOUVERIE WILLIAM BRAND, 1ST Viscount (1812-1892), speaker of the House of Commons, was the second son of the 21st Baron Dacre, and descended from John Hampden, the patriot, in the female line; the barony of Dacre devolved on him in 1890, after he had been created Viscount Hampden in 1884. He entered parliament as a Liberal in 1852, and for some time was chief whip of his party. In 1872 he was elected speaker, and retained this post till February 1884. It fell to him to deal with the systematic obstruction of the Irish Nationalist party, and his speakership is memorable for his action on the 2nd of February 1888 in refusing to admit the bill that was called the "Tithes Bill"—a step which led to the formal introduction of the closure into parliamentary procedure. He died on the 14th of March 1892, being succeeded as 2nd viscount by his son (b. 1841), who was governor of New South Wales, 1865-1890.

HAMPDEN, JOHN (c. 1595-1643), English statesman, the eldest son of William Hampden, of Great Hampden in Buckinghamshire, a descendant of a very ancient family of that place, said to have been established there before the Conquest, and of Elizabeth, second daughter of Sir Henry Croft, esq., and, in 1864 was ennobled, and, in 1866, was created viscount of Oliver, the future protector, was born about the year 1595, and, when he was but a child, he became the owner of a good estate and a ward of the crown. He was educated at the grammar school at Thame, and on the 30th of March 1610 became a commoner of Magdalen College at Oxford. In 1613 he was admitted a student of the Inner Temple. He first sat in parliament for the borough of Grampound in 1623, representing later Wendover in the first three parliaments of Charles 1., Buckinghamshire in the Short Parliament of 1640, and Wendover again in the Long Parliament. In the early days of his parliamentary career he was content to be overshadowed by Eliot, as in its later days he was content to be overshadowed by Pym and to be commanded by Essex. Yet it is Hampden, and not Eliot or Pym, who lives in the popular imagination as the central figure of the English revolution in its earlier stages. It is Hampden whose statue rather than that of Eliot or Pym has been selected to take its place in St Stephen's Hall as the noblest type of the parliamentary opposition, as Falkland's has been selected as the noblest type of parliamentary royalism.

Something of Hampden's fame no doubt is owing to the position which he took up as the opponent of ship-money. But he was hardly less distinguished by the merit of his work, which money would have been, than by the mingled massiveness and modesty of his character, his dislike of all pretences in himself or others, his brave contempt of danger, and his charitable readiness to shield others as far as possible from the evil consequences of their actions. Nor was he wanting in that skill which enabled him to influence men towards the ends at which he aimed, and which was spoken of as subtlety by those who disliked his ends.

During these first parliaments Hampden did not, so far as we know, open his lips in public debate, but he was increasingly employed in committee work, for which he seems to have had a special aptitude. In 1626 he took an active part in the preparation of the charges against Buckingham. In January 1627 he was bound over to answer at the council board for his refusal to pay the forced loan. Later in the year he was committed to the house, and then sent into confinement in Hampshire, from which he was liberated just before the meeting of the third parliament of the reign, in which he once more rendered useful but unobtrusive assistance to his leaders.

When the breach came in 1629, Hampden was found in episcopal correspondence with the imprisoned Eliot, discussing with him the prospects of the Massachusetts colony, or rendering
hospitality and giving counsel to the patriot's sons now that they were deprived of a father's personal care. It was not till 1637, however, that his resistance to the payment of ship-money gained for his name the lustre which it has never since lost. (See Ship-Money.) Seven out of the twelve judges sided against him, but the connexion between the rights of property and the parliamentary system was firmly established in the popular mind. The tax had been justified, says Clarendon, who expresses his admiration at Hampden's "rare temper and modesty at this crisis, "upon such grounds and reasons as every slander- by was able to swear was not law" (Hist. i. 159, viii. 82).

In the Short Parliament of 1640 Hampden stood forth amongst the leaders. He guided the House in the debate on the 4th of May in its opposition to the grant of twelve subsidies in return for the surrender of ship-money. Parliament was dissolved the next day, and on the 6th an unsuccessful search was made among the papers of Hampden and of other chiefs of the party to discover incriminating correspondence with the Scots. During the eventful months which followed, when Strafford was striving in vain to force England, in spite of its visible reluctance, to support the king in his Scottish war, rumour has much to tell of Hampden's activity in rousing opposition. It is likely enough that the rumour is in the main true, but we are not possessed of any satisfactory evidence on the subject.

In the Long Parliament, though Hampden was by no means a frequent speaker, it is possible to trace his course with sufficient distinctness. His power consisted in his personal influence, and as a debater rather than as an orator. "He was not a man of many words," says Clarendon, "and rarely began the discourse or made the first entrance upon any business that was assumed, but a very weighty speaker, and after he had heard a full debate and observed how the House was likely to be inclined, took up the argument and shortly and clearly and craftily so stated it that he commonly conducted it to the conclusion he desired; and if he found he could not do that, he never was without the dexterity to divert the debate to another time, and to prevent the determining anything in the negative which might prove inconvenient in the future" (Hist. iii. 31). Unwary in attendance upon committees, he was in all things ready to second Pym, whom he plainly regarded as his leader. Hampden was one of the eight managers of Strafford's prosecution. Like Pym, he was in favour of the more legal and regular procedure by impeachment rather than by attainder, which at the later stage was supported by the majority of the Commons; and through his influence a compromise was effected by which, while an attainder was subsequently adopted, Strafford's counsel were heard as in the case of an impeachment, and thus a serious breach between the two Houses, which threatened to cause the breakdown of the whole proceedings, was averted.

There was another plank in which there was no agreement. A large minority wished to retain Episcopacy, and to keep the common Prayer Book unaltered, whilst the majority were at least willing to consider the question of abolishing the one and modifying the other. On this subject the parties which ultimately divided the House and the country itself were fully formed as early as the 8th of February 1641. It is enough to say that (as under Pym) Hampden fully shared in the counsels of the opponents of Episcopacy. It is not that he was a theoretical Presbyterian, but the bishops had been in his days so fully engaged in the imposition of obnoxious ceremonies that it was difficult for him, impossible, to dissociate them from the cause in which they were embarked. Closely connected with Hampden's distrust of the bishops was his distrust of monarchy as it then existed. The dispute about the church therefore soon attained the form of an attack upon monarchy, and, when the majority of the House of Lords arrayed itself on the side of Episcopacy and the Prayer Book, of an attack upon the House of Lords as well.

No serious importance therefore can be attached to the offers of adhesion to the roundheads made from time to time to Hampden and his friends. Charles would gladly have given them office if they had been ready to desert their principles. Every day Hampden's conviction grew stronger that Charles would never abandon the position which he had taken up. In August 1640 Hampden was one of the four commissioners who attended Charles in Scotland, and, though the king's conduct there, connected with such events as the "Incident," must have proved to a man far less sagacious than Hampden that the time for compromise had gone by. He was therefore a warm supporter of the Grand Remon- strance, and was marked out as one of the five impeached members whose attempted arrest brought at last the opposing parties into open collision (see also Pym, Strode, Holles and Lenthall). Under the angry scene which arose on the proposal to print the Grand Remonstrance, it was Hampden's personal intervention which prevented an actual conflict, and it was after the impeachment had been attempted that Hampden laid down the two conditions under which resistance to the king became the duty of a good subject. Those conditions were an attack upon religion and an attack upon the fundamental laws. There can be no doubt that Hampden fully believed that both those conditions were fulfilled at the opening of 1642.

When the Civil War began, Hampden was appointed a member of the committee for safety, levied a regiment of Buckinghamshire men for the parliamentary cause, and in his capacity of deputy-lieutenant carried out the parliamentary militia ordinance in the county. In the earlier operations of the war he bore himself gallantly and well. He took no actual part in the battle of Edgehill. His troops in the rear, however, arrested Rupert's charge at Kinerton, and he urged Essex to renew the attack here, and also after the disaster at Brentford. In 1643 he was present at the siege and capture of Reading. But it is not on his skill as a regimental officer that Hampden's fame rests; it is in peace his distinction lay in his power of disentangling the essential part from the non-essential. In the previous constitutional struggle he had seen that the one thing necessary was to establish the supremacy of the House of Commons. In the military struggle which followed he saw, as Cromwell saw afterwards, that the one thing necessary was to beat the enemy. He protested at once against Essex's hesitations and com- promises. In the formation of the confederacy of the six associated counties, which was to supply a basis for Cromwell's operations, he took an active part. His influence was felt alike in parliament and in the field. But he was not in supreme command, and he had none of that impatience which often leads able men to fail in the execution of orders of which they disapprove. His precious life was a sacrifice to his unselven devotion to the call of discipline and duty. On the 18th of June 1643, when he was holding out on Chalgrove Field against the superior numbers of Rupert till reinforcements arrived, he received two carbine balls in the shoulder. Leaving the field he reached Thame, survived six days, and died on the 24th.

Hampden married (1) in 1659 Elizabeth, daughter of Edmund Syneum of Pyton, Oxfordshire, and (2) Letitia, daughter of Sir Francis Knolys and widow of Sir Thomas Vachell. By his first wife he had nine children, one of whom, Richard (1631–1665) was chancellor of the exchequer in William III.'s reign; from two of his daughters are descended the families of Trevor-Hampden and Hobart-Hampden, the descent in the male line becoming apparently extinct in 1754 in the person of John Hampden.

John Hampden the younger (c. 1656–1690), the second son of Richard Hampden, returned to England after residing for about two years in France (see above). Later, Lord William Russell and Algernon Sidney and the party opposed to the arbitrary government of Charles II. With Russell and Sidney he was arrested in 1683 for alleged complicity in the Rye House Plot, but more fortunate than his colleagues his life was spared, although as he was unable to pay the fine of £40,000 which was imposed upon him he remained in prison. Then in 1685, after the failure of Monmouth's rising, Hampden was again brought to trial, and on a charge of high treason was condemned to death. But the sentence was not carried out, and having paid £6000 he was set at liberty. In the Convention parliament of 1689 he represented Wendover, but in the subsequent parliament he
failed to secure a seat. He die by his own hand on the 12th of December 1696. Hampden wrote numerous pamphlets, and Bishop Burnet described him as "one of the learnedest gentlemen I ever knew." See S. R. Gardiner's *Hist. of England* and of the *Great Civil War*: the article on Hampden in the *Dict. of Nat. Biography*, by C. H. Firth, with authorities there collected; Clarendon's *Hist. of the Rebellion*, p. 202, and H. W. B. Hough, *Courtiers, Cowards, and Oxon.* ill. 59; Lord Nugent's *Memorials of John Hampden* (1831); Macaulay's *Essay on Hampden* (1831). The printed pamphlet announcing his capture, 9th November, 1642, and the account by Forster in the *Assize of the Five Members* (1660), has been proved by Gardiner to be a forgery (*Hist. of England*, x. 135). Mr Firth has also shown in *The Academy* for 1869, November 2 and 9, that "the belief that we possess the words of Hampden's last prayer must be abandoned."

HAMPSDEN, RENN DICKSON (1793-1868), English divine, was born in Barbados, where his father was colonel of militia, in 1793, and was educated at Oriel College, Oxford. Having taken his B.A. degree with first-class honours in both classics and mathematics in 1813, he next year obtained the chancellor's prize for a Latin essay, and shortly afterwards was elected to a fellowship in his college, to which he contributed much. He contributed a paper to the *Transactions of the Royal Institution*, and in 1818 was selected by his contemporaries to write the life of the astronomer, Dr G. B. C. South. With these he was selected by the *Transactions of the Royal Institution*, and has published *Essays on the Philosophical Evidence of Christianity*, followed by a volume of Parochial Sermons illustrative of the *Importance of the Revelation of God in Jesus Christ* (1828). In 1829 he returned to Oxford and was Bampton lecturer in 1832. Notwithstanding a charge of Arianism now brought against him by the Tractarian party, he in 1833 passed from a tutorship at Oriel to the principaship of St Mary's Hall. In 1834 he was appointed professor in the University of Oxford, and in the last year of his life he became Regius professor of divinity in 1868. There resulted a widespread and violent though ephemeral controversy, after the subsidence of which he published a *Lecture on Tradition*, which passed through several editions, and a volume on *The Thirty-nine Articles of the Church of England*. His nomination by Lord John Russell to the vacant see of Hereford in December 1847 was again the signal for a violent and organized opposition; and his consecration in March 1848 took place in spite of a remonstrance by many of the bishops and the resistance of Dr John Merewether, the dean of Hereford, who went so far as to vote against his election. The approval of the new bishop at Fulham was, however, his. As bishop of Hereford Dr Hampden made no change in his long-continued habits of studious seclusion, and though he showed no special ecclesiastical activity or zeal, the diocese certainly prospered in his charge. Among the many more of his later writings were the articles on Aristotle, Plato and Socrates, contributed to the eighth edition of the *Encyclopaedia Britannica*, and afterwards reprinted with additions under the title of the *Fathers of Greek Philosophy* (Edinburgh, 1863). In 1860 he had a paralytic seizure, and died in London on the 23rd of April 1868.

His daughter, Henrietta Hampden, published *Some Memorials of R. D. Hampden* in 1871.

HAMPSDEN-SIDNEY, a village of Prince Edward county, Virginia, U.S.A., about 70 m. S.W. of Richmond. Pop. about 350. Daily stages connect the village with Farmville (pop. in 1910, 2971), the county-seat, 6 m. N.E., which is served by the Norfolk & Western and the Tidewater & Western railways. Hoken by Hampden is the *Hampden-Sidney College*, founded by the presbytery of Hanover county as Hampden-Sidney Academy in 1776, and named in honour of John Hampden and Algernon Sidney. It was incorporated as Hampden-Sidney College in 1783. The incorporators included James Madison, Patrick Henry (who is believed to have drafted the college charter), Paul Carrington, William Cabell, Sen., and Nathaniel Venable. The Union Theological School was established in connexion with the college in 1812, but in 1858 was removed to Richmond, Virginia. In 1907-1908 the college had 8 in-

structors, 125 students, and a library of 11,000 volumes. The college has maintained a high standard of instruction, and many of its graduates have been prominent as public men, educationalists and preachers. Among them were Robert W., and William Henry Harrison, William H. Cabell (1772-1853), president of the Virginia Court of Appeals; George M. Bibb (1772-1853), secretary of the treasury (1844-1845) in President Tyler's cabinet; William B. Preston (1805-1862), secretary of the navy in 1849-1850; William Cabell Rives and General Sterling Price (1809-1867).

HAMPShire (or COUNTY OF SOUTHAMPTON, abbreviated HANTS), a southern county of England, bounded N. by Berkshire, N.W. by Surrey and Lancaster, E. by the English Channel, and S. by Dorsetshire and Wiltshire. The county is drained by the coast of the mainland, which is for the most part low and irregular, a strait, known in its western part as the Solent, and in its eastern as Spithead, separates the Isle of Wight. This island is included in the county. The inlet of Southampton Water opens from this strait, penetrating inland in a north-westerly direction for 12 m. The easterly part of the coast forms a large shallow bay containing Havyling and Portsca Islands, which divide it into Chichester Harbour, Langston Harbour and Portsmouth Harbour. The westerly part forms the more extensive coastal belt, including the approaches to Spithead. In its general aspect Hampshire presents a beautiful variety of gently rising hills and fruitful valleys, adorned with numerous mansions and pleasant villages, and interspersed with extensive tracts of woodland. Low ranges of hills, included in the system to which the general name of the Western Downs is given, reach their greatest elevation in the northern and eastern parts of the county, where there are many picturesque eminences, of which Beacon, Sidown and Pilot hills near Highclere in the north-west, each exceeding 800 ft., are the highest. The portion of the county which is in Hampshire is north-westwardly included in The New Forest, a sequestered district, one of the few remaining examples of an ancient afforested tract. The river Avon in the south-west rises in Wiltshire, and passing Fordingbridge and Ringwood falls into Christchurch Bay below Christchurch, being joined close to its mouth by the Stour. The Lymington or Boldre river rises in the New Forest, and after collecting the waters of several brooks falls into the Solent through Lymington Creek. The Beaulieu in the eastern part of the forest also enters the Solent by way of a long and picturesque estuary. The Test rises near Overton in the north, and after its junction with the Itchen at eastward of Medbourne, and Romney, enters the head of Southampton Water. The Itchen rises near Alresford, and flowing by Winchester and Eastleigh falls into Southampton Water east of Southampton. The Hamble rises near Bishops Waltham, and soon forms a narrow estuary opening into Southampton Water. The Wey, the Loddon and the Blackwater, rising in the north-eastern part of the county, bring that part into the basin of the Thames. The streams from the chalk hills run clear and swift, and the trout-fishing in the county is famous. Salmon are taken in the Avon.

Geology.—Somewhat to the north of the centre of the county is a broad expanse of hilly chalk country about 21 m. wide; the whole of it has been bent up into a great fold so that the strata on the north dip northward steeply in places, while those on the south dip in the opposite direction. Next to this is the chalk downs, beneath Tertiary strata of the "London Basin," and some little distance south of Winchester it runs in a similar manner beneath the Tertiary strata of the "Jura Basin." Scattered here and there over the chalk are small outlying remnants which remain to show that the two Tertiary areas were once continuous, before the agencies of denudation had removed them from the chalk. Some of these are exposed as a strata beneath the chalk over a small area on the eastern border.

The oldest formation in Hampshire is the Lower Greensand in the neighbourhood of Woolmer Forest and Petersfield; it is represented by the beds of sandstones and limestones which form the high ridge which runs on towards Hind Head, then by the sands and clays of the Sandgate beds which lie in the low ground westward of Droxford and Fareham, and finally by the chalk strata westward beneath the Gault. The last-mentioned formation, a clay, worked here and there for bricks, crops out as a narrow band from Fareham through Woolham and Stroud common to Petersfield.
Hampshire

Between the Gault and the chalk is the Upper Greensand with a hard bed of calcareous sandstone, the Mottisfont Rock, which is a very important agricultural boundary. The Upper Greensand is also exposed at Burghclere as an incline; the rocks are bent into a sharp anticline and the chalk, having been denuded from its crest, the Upper Greensand is exposed. The beds through which the anticline brings up the chalk through the Tertiary rocks in the neighbourhood of Fareham. Besides occupying the central region already mentioned, which includes Basingstoke, Whitchurch, Alverstoke, Andover, and in the latter in places, going rise to heathy commons. The southern Tertiary rocks of the Hampshire basin include the Lower Eocene beds, which are mostly brought to the surface at Bishop's Waltham, to Havant. These are succeeded towards the south by the Upper Eocene beds, the Bracklesham beds and the Barton Beds, the chalk and the Greensand. The Greensand and the Bagshot beds at Bournemouth contain numerous remains of subterranian plants. A series of clays and sands of Oligocene age (unknown in the London basin) are found in the vicinity of Lymington, Brockenhurst and Beaulieu; they include the Heardon beds, with a fluvio-marine fauna, well exposed at Hordwell cliffs, and the marine beds of Brockenhurst. Numerous small outliers of Tertiary rocks are scattered over the chalk area, and many small patches of marine clay are obscured by patches of Pleistocene deposits of brick earth and gravel.

Agriculture and Industries.—Nearly seven-tenths of the total area is agricultural. The rich alternation of chalk and clay between Whitchurch and Basingstoke contains 540,000 acres of good grazing land and of this area about two-fifths is in permanent pasture. The acreage under oats is roughly equal to that under wheat and barley. Small quantities of rye and hops are cultivated. Barley is usually sown after fatturn, and is found to be growing best in the low-lying levels. Beans, peas and potatoes are only grown to a small extent. On account of the number of sheep pastured on the uplands a large acreage is given to animal husbandry, and the land under grazing and rough moors is much greater than in any other county of the southern counties of England. Sanfin is the grass most largely grown, as it is best adapted to land with a calcareous subsoil. In the lower levels no sanfin and scarcely any clover is grown, the hay being supplied from the rich water meadows, which are managed with great skill and attention, and give the best money return of any lands in the county. Where a rapid stream of water can be passed over the meadow land it is sowed to grass, but as this is seldom possible the meadow land is generally under grass, which is grown during the cold weather so as to be fit for pasture before any traces of vegetation appear in the surrounding fields. Hops are grown in the eastern part of the county bordering on Surrey. Farming is generally conducted on the best modern principles, but owing to the variety of soil there is perhaps no county in England in which the rotation observed is more diversified, or the processes and methods of practice more varied than in Hampshire, where a large number of model farms. The waste land has been mostly brought under tillage, but a very large acreage of the ancient forests is still occupied and the pastures to the west of the Forest of Bere and Waltham Chase, and in the Isle of Wight Parkhurst Forest. The honey of the county is especially celebrated. Much attention is paid to the cultivation of hops, and the original spot where the sheep was white-faced with horns, but most of the flocks are now of a Southdown variety which have acquired certain distinct peculiarities, and are known as "short wools" or "Hampshire downs.

Cattle are of no distinctive breed, and are kept largely for dairy purposes, especially for the supply of milk. The breeding and rearing of horses is widely practised, and the fattening of pigs has long been an important industry. The original breed of pheasants is kept with Berkshire, Essex and Chinese pigs. In the vicinity of the forest the pigs are fed on acorns and beechmast, and the flesh of those so reared is considered the best, though the reputation of Hampshire bacon is scarcely so well known as that of other counties which it rivals.

The manufactures are unimportant, except those carried on at Portsmouth and Gosport in connection with the royal navy. Southampton is one of the principal ports in the kingdom. In many of the towns of this district are the carpet manufacturers, and at several places. Fancy pottery and terra-cotta are made at Fareham and Bishop's Waltham; and Ringwood is celebrated for its knitted gloves. At most of the coast towns fishing is carried on and there are oyster beds at Hayling Island. Coves in the Isle of Wight is the station of the Royal Yacht Squadron, and has building yards for yachts and large vessels. The principal seaside resorts besides Sandown and Ryde, are Freshwater Bay, Yarmouth, Sandown, Shanklin, and the Solent, Southsea and South Hayling. Alverstoke is the principal military training centre in the British Isles.

Communication is provided mainly by the lines of the London & South-Western railway company, which also owns the docks at Southampton. The main line serves Fareham, Basingstoke, Whitchurch and Andover, and a branch diverges southward from Basingstoke for Winchester, Southampton and the New Forest and Bournemouth. An alternative line from eastward to Winchester serves Aldershot, Alton and Alresford. The main line runs south-eastward from Petersfield to Havant, where it joins the Portsmouth line. The London & South-Western Railway system also connects Portsmouth and Gosport with Southampton, in numerous branches in the Isle of Wight affording communications between Southampton, Bournemouth, and the midlands and north of England. None of the rivers, except in the estuarine parts, is navigable.

Population and Administration.—The area of the ancient county of Hampshire (pop. 1,039,031) was 2,654 square miles, the area of the Isle of Wight, 1,068 square miles. The population of Hampshire was 699,097 in 1891 and 797,634 in 1901. The area of the administrative county of Southampton is 958,742 acres, and that of the administrative county of the Isle of Wight 84,668 acres. The county is divided for parliamentary purposes into the following divisions: Northern or Basingstoke, Western, or Andover, Eastern, or Petersfield, Southern or Fareham, New Forest, and Isle of Wight, each returning one member. It also includes the parliamentary boroughs of Portsmouth and Southampton, each returning two members, and of Christchurch and Winchester, each returning one. There are 11 Parliamentary boroughs in Hampshire, Pop. 738,536, Basingstoke (7973), Bournemouth (59,762), Christchurch (11,043), Portsmouth (168,133), Romsey (3465), Southampton (104,824), Winchester (20,925), and in the Isle of Wight, Newport (10,911), Ryde (1342), and Sandown (2806). The county is in the western circuit, and the assizes are held at Winchester. It has one court of quarter sessions, and is divided into 14 petty sessional divisions. The boroughs of Andover, Basingstoke, Bournemouth, Lymington, Newport, Portsmouth, Romsey, Ryde, Southampton (a county in itself) and Winchester have separate commissions of the peace, and the boroughs of Andover, Bournemouth, Portsmouth, Southampton and Winchester have, in addition separate courts of quarter sessions. There are 394 civil parishes, of which three, the Isle of Wight, the Forest of Bere and the villages of Hampshire, are unparished.

History.—The earliest English settlers in the district which is now Hampshire were a Jutish tribe who occupied the northern parts of the Isle of Wight and the valleys of the Meon and the Hamble. Their settlements were, however, unimportant, and soon became absorbed in the territory of the West Saxons who in 495 landed at the mouth of the Itchen under the leadership of Cerdic and Cynric, and in 588 slew 5000 Britons and their king. But it was not until after another decisive victory at Cheriton in 519 that the district was definitely organized as West Saxon territory. The place-names of Hampshire, and of all the districts which were later invested with the title of Hampshire, are evidence of the great centuries that followed, becoming the nucleus of the vast later kingdom of Wessex. The Isle of Wight was subjugated in 530 and bestowed on Stuf and Wiltgar, the nephews of Cerdic. The Northmen made their first attack on the Hampshire coast in 835, and for the two centuries following the district was the scene of perpetual devastations by the Danish pirates, who made their headquarters in the Isle of Wight, from which they plundered the opposite coast. Hampshire suffered less from the Conquest than almost any English county, and was a favourite resort of the Norman kings. The alleged destruction of property for the formation of the New Forest is refuted by the Domestacy record, which shows that this district had never been under cultivation. In the civil war of Stephen's reign Baldwin de Redvers, lord of the Isle of Wight, supported the empress Matilda, and Winchester Castle was secured in her behalf by Robert of Gloucester, while the besieging fortress of Wolseyes was held for Stephen by Bishop Henry de Blois. In 1216 Louis of France, having arrived in the county by invitation of the barons, occupied Winchester Castle, and only met with resistance at Oddham Castle, which was taken after a siege of thirteen days. During the Wars of the Roses, Anthony Woodville and Henry Ward Rivers, defeated the duke of Clarence at Southampton, and in 1471, after the battle of Barnet, the countess of Warwick took
sanctuary at Beaulieu Abbey. The chief events connected with Hampshire in the Civil War of the 17th century were the gallant resistance of the cavalier garrisons at Winchester and Basing House; a skirmish near Cheriton in 1644 notable as the last battle fought on Hampshire soil; and the concealment of Charles at Titchfield in 1647 before his removal to Carisbrooke. The duke of Monmouth, whose rebellion met with considerable support in Hampshire, was captured in 1685 near Ringwood.

Hampshire was among the earliest shires to be created, and must have received its name before the revival of Winchester in the latter half of the 7th century. It is first mentioned in the Saxon Chronicle in 755, at which date the boundaries were practically the same as those of the present day. The Domesday Survey mentions 344 hundreds in Hampshire, but by the 14th century the number had been reduced to 37. The hundreds of East Medina and West Medina in the Isle of Wight are mentioned in 1316. Constables of the hundreds were first appointed by the Statute of Winchester in 1285, and the hundred court continued to elect a high constable for Fordingbridge until 1878. The chief court of the Isle of Wight was the Knighton court held at Newport every three weeks. The sheriff's court and the assizes and quarter sessions for the county were formerly held at Winchester, but in 1855 the county court was held at Andover; and Portsmouth, Southampton and Winchester had separate jurisdictions. Southampton was made a county by itself with a separate sheriff in 1447.

In the middle of the 7th century Hampshire formed part of the West Saxon bishopric of Dorchester-on-Thames. On the transference of the episcopal seat to Winchester in 676 it was included in that diocese in which it has remained ever since. In 791 the archdeacons of Winchester were coextensive with the county and comprised the ten rural deaneries of Alresford, Alton, Andover, Basingstoke, Droxford, Fordingbridge, Isle of Wight, Sombourne, Southampton and Winchester. In 1850 the Isle of Wight was subdivided into the deaneries of East Medina and West Medina. In 1856 the deaneries were increased to 24. In 1871 the archdeaconry of the Isle of Wight was constituted, and about the same time the deaneries were reduced to 21. In 1892 the deaneries were reconstituted and made 18 in number, and the archdeaconry of the Isle of Wight was divided into the deaneries of East Wight and West Wight.

After the Conquest the most powerful Hampshire baron was William Fitz-Osbern, who in addition to the lordship of the Isle of Wight held considerable estates on the mainland. At the time of the Domesday Survey the chief landholders were Hugh de Port, ancestor of the Fitz-Johns; Ralf de Mortimer; William Mauduit whose name is preserved in Hartley Mauditt; and Waleran, called the Huntsman, ancestor of the Walerand family. Hursley near Winchester was the seat of Richard Cromwell; and Gilbert White, the naturalist, was curate of Farringdon near Selborne.

Apart from the valuable foreign and shipbuilding trade which grew up with the development of its ports, Hampshire has always been mainly an agricultural county, the only important manufacture being that of wool and cloth, which prospered at Winchester in the 12th century and survived till within recent years. Salt-making and the manufacture of iron from native ironstone also flourished in Hampshire from pre-Norman times until within the 19th century. In the 14th century Southampton had a valuable trade with Venice, and from the 15th to the 18th century many famous warships were constructed in its docks. Silk-weaving, formerly carried on at Winchester, Andover, Odiham, Alton, Whitchurch and Overton, the first mills being set up in 1684 at Southampton by French refugees. The paper manufacture at Laverstoke was started by the Portsals, a family of Huguenot refugees, in 1685, and a few years later Henri de Portal obtained the privilege of supplying the bank-note paper to the Bank of England.

Hampshire returned four members to parliament in 1295, when the boroughs of New Alresford, Alton, Andover, Basingstoke, Overton, Portsmouth, Southampton, Winchester, Yarmouth and Newport were also represented. After this date the county was represented by two members, but most of the boroughs ceased to make returns. Odiham and the Isle of Wight were represented in 1300, Fareham in 1306, and Petersfield in 1307. From 1311 to 1357 Southampton, Portsmouth, and Winchester were the only boroughs represented. By the end of the 16th century Petersfield, Newport, Yarmouth, and Andover had regained representation, and Stockbridge, Christchurch, Lymington, Newtown and Whitchurch returned two members each, giving the county with its boroughs a total representation of 26 members. Under the Reform Act of 1832 the county returned four members in four divisions; Christchurch was returned by the county, the Stairstead and Basingstoke divisions by the boroughs, and Stockbridge and Whitchurch were disfranchised. By the act of 1868 Andover, Lymington and Newport were deprived of one member each.

Antiquities.—Hampshire is rich in monastic remains. Those considered under separate headings include the monastery of Hyde near Winchester, the magnificent churches at Christchurch and Romsey, the ruins of Netley Abbey, and of Beaulieu Abbey in the New Forest, the fragments of the priory of St Denys, Southampton, the church at Porchier and the slight ruins at the priory of St Peter, at Porchier, and at Quarr Abbey in the Isle of Wight. Other foundations, of which the remains are slight, were the Augustinian priory of Southwick near Fareham, founded by William of Wykeham; that of Breamore, founded by Baldwin de Redvers, and that of Mottilson near Romsey, endowed soon after the Conquest. There are many churches of interest, apart from the cathedral church of Winchester and those in some of the towns in the Isle of Wight, or already mentioned in connexion with monastic foundations. Pre-Conquest work is well shown in the churches of Corhampton and Breamore, and very early masonry is also found in Headbourne Worthy church, where is also a brass of the 15th century to a scholar of Winchester College in collegiate dress. The most noteworthy Norman churches are at Chilcombe and Kingsclere and (with Early English additions) at Brockenhurst, Upper Clatford, which has the unusual arrangement of a double chancel arch, Hambledon, Milford and East Meon. Principally Early English are the churches of Cheriton, Grately, which retains some excellent contemporary stained glass from Salisbury cathedral; Sopley, which is partly Perpendicular; and Thruxton, which contains a peel to Sir John Islip (d. 1406), affording a very early example of complete plate armour. Specimens of the later styles are generally less remarkable. The frescoes in Bramley church, ranging in date from the 13th to the 15th century, include a representation of the murder of Thomas à Beckett. A fine series of Norman fonts in black marble should be mentioned; they occur in Winchester cathedral and the churches of St Michael, Southampton, East Meon and St Mary Bourne.

The most notable old castles are Carisbrooke in the Isle of Wight; Porchester, a fine Norman stronghold embodying Roman remains, on Portsmouth Harbour; and Hurst, guarding the mouth of the Solent, where for a short time Charles I was imprisoned. Henry VIII built several forts to guard the Solent, Spithead and Southampton Water; Hurst Castle was one, and others remaining, but adapted to various purposes, are at Cowes, Calshot and Netley. Fine mansions are unusually numerous. That of Stratfieldsaye or Stratfieldsaye, which belonged to the Pitt family, was purchased by parliament for presentation to the duke of Wellington in 1817, his descendants holding the estate from the Crown in consideration of the annual tribute of a flag to the guard-room at Windsor. A statue of the duke stands in the grounds, and his war-horse "Copenhagen" is buried here. The name of Tichborne Park, near Alresford, is well known in connexion with the famous claimant of the estates whose case was heard in 1871. Among ancient mansions the Jacobean Bramshill is conspicuous, lying near Stratfieldsaye in the north of the county. It is built of stone and is highly decorated, and though the complete original design was not carried out the house is among the finest of its type in England. At Bishops Waltham, a small town 10 m. S.S.E. of Winchester,
HAMPSTEAD—HAMPTON

Henry de Blois, bishop of Winchester, erected a palace, which received additions from William of Wykeham, who died here in 1404, and from other bishops. The ruins are picturesque but not extensive.

HAMPSTEAD, a north-western metropolitan borough of London, England, bounded E. by St Pancras and S. by Marylebone, and extending N. and W. to the boundary of the county of London. Pop. (1901), 81,942. The name, Hampton, is synonymous with "homestead," and the manor is first named in a charter of Edgar (957-975), and was granted to the abbey of Westminster by Ethelred in 986. It reverted to the Crown in 1559, and had various owners until the close of the 18th century, when it came to Sir Thomas Spencer Wilson, whose descendants retain it. The borough includes the sub-manor of Belzize and part of the hamlet of Kilburn.

The surface of the ground is sharply undulating, an elevating spur extending south-west from the neighbourhood of Highgate, and turning south through Hampstead. It reaches a height of 443 ft. above the level of the Thames. The Edgware Road bounds Hampstead on the west; and the borough is intersected, parallel to this thoroughfare, by Finchley Road, and Hampstead Heath, which, continued under the names of Rosllyn Hill, High Street, Heath Street, and North End, crosses the Heath for which Hampstead is chiefly celebrated. This is a fine open space of about 420 acres, including in its bounds the summit of Hampstead Hill. It is a sandy tract, in parts well wooded, diversified with several small sheets of water, and to a great extent preserves its natural characteristics unaltered. Beautiful views, both near and distant, are commanded from many points. Of all the public grounds within London this is the most valuable to the populace at large; the number of visitors on a Bank holiday in August is generally, under favourable conditions, about 100,000; and strenuous efforts are always forthcoming from either public or private bodies when the integrity of the Heath is in any way menaced. As early as 1829 attempts were made to save it from the builder's records. In 1871 its preservation as an open space was insured after several years' dispute, when the lord of the manor gave up his rights. An act of parliament transferred the ownership to the Metropolitan Board of Works, to which body the London County Council succeeded. The Heath is continued eastward in Parliament Hill (borough of St Pancras), acquired for the public in 1809, and westward outside the county boundary in Golders Hill, owned by Sir Spencer Wells, Bart., until 1898. A Protection Society guards the preservation of the natural beauty and interests of the Heath. It is the interests of visitors alone that must be consulted, for Hampstead, adding to its other attractions a singularly healthy climate, has long been a favourite residential quarter, especially for lawyers, artists and men of letters. Among famous residents are found the first earl of Chatham, John Constable, George Romney, George du Maurier, Joseph Butler, author of the Analogy, Sir Richard Steele, John Keats, the sisters Joanna and Agnes Baillie, Leigh Hunt and many others. The parish church of St John (1747) has several monuments of eminent persons. Chatham's residence was at North End, a picturesque quarter yet preserving characteristics of a rural village; here also Wilkie Collins was born. Three old-established inns, the Bull and Bush, the Spaniards, and Jack Straw's Castle (the name of which has no historical significance), claim many great names among former visitors; while the Upper Pavilion, which houses the meeting-place of the Kit-Cat Club. Chalybeate springs were discovered at Hampstead in the 17th century, and early in the 18th rivaled those of Tunbridge Wells and Epsom. The name of Well Walk recalls them, but their fame is lost. There are others at Kilburn.

In the south-east Hampstead includes the greater part of Primrose Hill, a public ground adjacent to the north side of Regent's Park. The borough has in all about 350 acres of open spaces. The name of the sub-manor of Belzize is preserved in several streets in the central part. Kilburn, which as a district extends outside the borough, takes name from a stream which, as the Westbourne, entered the Thames at Chelsea. Fleet Road similarly recalls the more famous stream which washed the walls of the City of London on the west. Hampstead has numerous charitable institutions, amongst which are the North London consumptive hospital, the Orphan Working School, Haverton Hill (1758), the general hospital and the north-western fever hospital. In Finchley Road are the New and Hackney Colleges, both Congregational. The parliamentary borough of Hampstead returns one member. The borough council consists of a mayor, 7 aldermen and 42 councillors. Area, 2265 acres.

HAMPTON, WADE (1818-1902), American cavalry leader was born on the 5th of March 1818 at Columbia, South Carolina, the son of Wade Hampton (1791-1838), one of the wealthiest planters in the South, and the grandson of Wade Hampton (1754-1835), a captain in the War of Independence and a brigadier-general in the War of 1812. He graduated (1836) at South Carolina College, and was trained for the law. He devoted himself, however, to the management of his great plantations in South Carolina and in Mississippi, and took part in state politics and legislation. Though his own views were opposed to the prevailing state-rights tone of South Carolinian opinion, he threw himself heartily into the Southern cause in its darkest hour. He was governor of his state in 1867-1870, being installed after a memorable contest; he served in the United States Senate in 1879-1891, and was United States commissioner of Pacific railways in 1893-1897. He died on the 11th of April 1902.

See E. L. Wells, Hampton and Reconstrucion (Columbia, S. C., 1907).

HAMPTON, an urban district in the Uxbridge parliamentary division of Middlesex, England, 15 m. S. of St Paul's cathedral, London, on the river Thames, served by the London & South Western Railway. Pop. (1901), 531. Close to the river, a mile below the town, stands Hampton Court Palace, one of the finest extant specimens of Tudor architecture, and formerly a royal residence. It was erected by Cardinal Wolsey, who in 1515 received a lease of the old mansion and grounds for 99 years. As the splendour of the building seemed to awaken the curiosity of Henry VIII., Wolsey in 1526 thought it prudent to make him a present of it. It became Henry's favourite residence, and he made several additions to the building, including the great hall and chapel in the Gothic style. Of the original five quadrangles only two now remain, but a third was erected by Sir Christopher Wren, for William and Mary. In 1694 a great fire of the effects of the palace took place by order of parliament, and later the manor itself was sold to a private owner but immediately after came into the hands of Cromwell; and Hampton Court continued to be one of the principal residences of the English sovereigns until the time of George II. It was the birthplace of Edward VI., and the meeting-place (1604) of the conference held in the reign of James I. to settle the dispute between the Presbyterians and the state clergy. William III., riding in the grounds, met with the accident which resulted in his death. It is now partly occupied by persons of rank in reduced circumstances; but out of state apartments and picture
HAMPTON—HAMPTON ROADS

galleries are open to the public, as is the home park. The
gardens, with their ornamental waters, are beautifully laid out
in the Dutch style favoured by William III., and contain
a magnificent vine planted in 1768. In the enclosure north of the
palace, called the Wilderness, is the Maze, a favourite resort.
North again lies Bushey Park, a royal demesne exceeding 1000
acres in extent. It is much frequented, especially in early
summer, when its triple avenue of horse-chestnut trees is in
blossom.

Among several residences in the vicinity of Hampton is
Garrick Villa, once, under the name of Hampton House, the
residence of David Garrick the actor. Sir Christopher Wren
and Sir Richard Steele are among famous former residents.

HAMPTON, a city and the county-seat of Elizabeth City
county, Virginia, U.S.A., at the mouth of the James river, on
Hampton Roads, about 15 m. N.W. of Norfolk. Pop. (1860),
2513; (1900) 2764, including 1240 negroes; (1910) 5350. It is
served by the Chesapeake & Ohio railroad, and by trolley lines
to Old Point Comfort and Newport News. Hampton is an
agricultural shipping point, ships fish, oysters and canned crabs,
and manufactures fish oil and brick. In the city are St John's
church, built in 1727; a national cemetery, a national soldiers'
home (formerly Phoebeus and Hampton), which in 1907-1908
cared for 4093 veterans and had an average attendance of 2267;
and the Hampton Normal and Agricultural Institute (co-
educational), which was opened by the American Missionary
Association in 1868 for the education of negroes. This last was
chartered and became independent of any denominational
control in 1870, and was superintended by Samuel Chapman
Armstrong (q.v.) from 1868 to 1893. The school was opened
in 1875 to Indians, whose presence has been of distinct advantage
to the negro, showing him, says Booker T. Washington, the most
famous graduate of the school, that the negro race is not alone
in its struggle for improvement. The National government
pays $167 a year for the support of each of the Indian students.

The underlying idea of the Institute is such industrial training
as will make the pupil a willing and a good workman, able to
Teach his trade to others; and the school's graduates include the
heads of other successful negro industrial schools, the organizers
of agricultural and industrial departments in Southern public
schools and teachers in graded negro schools. The mechanism
of the school includes three schemes: that of "work students,"
who work during the year, and have one-half of their time
provided for improvement; the scheme of "the. National government;
and one-half of that for the "Merrimac." Its turret, 9 ft, high
and 20 ft. in side diameter, seemed small for its length of
175 ft. and its breadth of 41 ft. 6 in., and this, with the lowness
of its freeboard, caused the vessel to be called the "Yankee
cheese-box on a raft." Forward of the turret was the iron pilot house,
square in shape, and rising about 4 ft. above the deck. The
"Monitor's" displacement was about 1200 tons and her armament
was two 11 in. Dahlgren guns; her crew numbered 38, while
that of the "Merrimac" numbered about 300. She was seaworthy
in everything, and more stable in her construction than the Monitor.
The "Monitor" was launched at Greenpoint, Long Island,
on the 30th of January, and was turned over to the government
on the 19th of the following month. The building of the two
vessels was practically a race between the two combatants.

On the 8th of March about 1 p.m., the "Merrimac,"
commanded by Commodore Franklin Buchanan (1795-1871),
steamed down the Elizabeth accompanied by two one-gun
gun-boats, to engage the wooden fleet of the Federals, consisting
of the frigate "Congress," 50 guns, and the sloop "Cumberland,"
30 guns, both sailing vessels, anchored off Newport News,
and the ship building the Monitor paid $5000 royalty to each
turret.

For the idea of the low freeboard and the revolving turret
Ericsson was indebted to Theodore R. Timby (1819-1900), who
in 1843 had filed a caveat for revolving towers for offensive or
defensive warfare whether placed on land or water, and to which
the company building the Monitor paid $5000 royalty to each
turret.
HAMSTER—HANAPER

HAMSTER, a European mammal of the order Rodentia, scientifically known as *Cricetus frumentarius* (or *C. cricetus*), and belonging to the mouse tribe, *Muridae*, in which it typifies the sub-family *Cricetinae*. The essential characteristic of the Cricetines is to be found in the upper cheek-teeth, which (as shown in the figure of those of *Cricetus* in the article Rodentia) have their cusps arranged in two longitudinal rows separated by a groove. The hamsters, of which there are several kinds, are short-tailed rodents, with large cheek-pouches, of which the largest is the common European *Cricetus ferus*. The range of this distribution comprises a large portion of Europe and Asia north of the Himalaya. All the European hamsters show more or less black on the under-parts, but the small species from Central Asia, which constitute distinct subgenera, are uniformly grey. The common species is specially interesting on account of its habits. It constructs elaborate burrows containing several chambers, one of which is employed as a granary, and filled with corn, frequently of several kinds, for winter use. As a rule, the males, females, and young of the first year occupy separate burrows, the females being kept inside the burrow during the winter season. Although feeding chiefly on roots, fruits and grain, it is also to some extent carnivorous, attacking and eating small quadrupeds, lizards and birds. It is exceedingly fierce and pugnacious, the males especially fighting with each other for possession of the females. The numbers of these destructive rodents are kept in check by foxes, dogs, cats and pole-cats, which feed upon them. The skin of the hamster is of some value, and its flesh is used as food. Its burrows are sought after in the countries where it abounds, both for capturing the animal and for rifting its store. America, especially North America, is the home of by far the greatest number of species of hamsters. The larger and heavier species are called white-footed or tow-headed mice. They are divided into numerous genera and the number of species is very large indeed. Both in size and form considerable variability is displayed, the species of *Holochilus* being some of the largest, while the common white-footed mouse (*Eliomys leucopus*) of North America is one of the smaller forms. Some kinds, such as *Oryzomys* and *Peromyscus* have long, rat-like tails, while others, like *Acodon*, are short-tailed and more vole-like in appearance. In habits some are partially arboreal, others wholly terrestrial, and a few more or less aquatic. Among the latter, the most remarkable are the fish-eating rats (*Ichthyomys*) of North-western South America, which frequent streams and feed on small fish. The Florida rice-rat (*Sigmodon hispidus*) is another well-known representative of the group. In the Old World the group is represented by the Persian *Calomyscus*, which is native to parts of Asia. (R. L.*)

HANAPER, properly a case or basket to contain a "hanap" (O. Eng. _náep_: cf. Dutch _nap_), a drinking vessel, a goblet with a foot or stem; the term which is still used by antiquaries for medieval stemmed cups. The famous Royal Gold Cup in the British Museum is called a "hanap" in the inventory of Charles VI. of France. The word "hanaper" (Med. Lat. _hanaperium_) was used particularly in the English chancery of a wicker basket in which were kept writs and other documents, and hence it became the name of a department of the chancery, now abolished, under an officer known as the clerk or warden of the hanaper, into which were paid fees and other moneys for the sealing of charters, patents, writs, &c., and from which issued certain writs under the great seal (S. R. Scargill-Bird, _Guide to the Public Records_ (1908). In Ireland it still survives in the office of the clerk of the crown and hanaper, from which are issued writs for the return of members of parliament for Ireland.

The steam frigates "Minnesota," and "Roanoke," the sailing frigate "St Lawrence," and several gun-boats, anchored off Fortress Monroe. Actual firing began about 2 o'clock, when the "Merrimac" was nearly a mile from the "Congress" and the "Cumberland." Passing the first of these vessels with terrific broadsides, the "Merrimac" rammed the "Cumberland" and then turned her fire again on the "Congress," in which an attempt to escape ran aground and was there under fire from three other Confederate gun-boats which had meanwhile joined the "Merrimac." About 3.30 p.m. the "Cumberland," which, while steadily engaged, had been depositing a heavy fire at the Confederate vessels, sank, with "her pennant still flying from the topmast above the waves." Between 4 and 4.30 the "Congress," having been raked fore and aft for nearly an hour by the "Merrimac," was forced to surrender. While directing a fire of hot shot to burn the "Congress," Commodore Buchanan of the "Merrimac" was severely wounded and was succeeded in the command by Lieutenant Catesby ap Roger Jones. The Federal steam frigates, "Roanoke," "St Lawrence" and "Minnesota" had all gone aground in their trip from Old Point Comfort toward the scene of battle, and only the "Minnesota" was near enough (about 1 m.) to take any part in the fight. She was in such shallow water that the Confederate iron-clad ram could not get near her at ebb tide, and about 5 o'clock the Confederates postponed her capture until the next day and anchored off Sewell's Point.

The "Monitor," under Lieut. John Lorimer Worden (1818-1897), had left New York on the morning of the 6th of March, after a dangerous passage in which she twice narrowly escaped sinking, she arrived at Hampton Roads during the night of the 8th, and early in the morning of the 9th anchored near the "Minnesota." When the "Merrimac" advanced to attack the "Minnesota," the "Monitor" went out to meet her, and the battle between the iron-clads began about 9 a.m. on the 9th. Neither vessel was able seriously to injure the other, and not a single shot penetrated the armour of either. The "Monitor" had the advantage of being able to out-maneuver her heavier and more unwieldy adversary; but the revolving turret made firing difficult and communications were none too good with the pilot house, the position of which on the forward deck lessened the range of the two turret-guns. The machinery worked so badly that the revolution of the turret was stopped. After two hours' fighting, the "Monitor" was drawn off, so that more ammunition could be placed in her turret. When the battle was renewed (about 11.30) the "Merrimac" began firing at the "Monitor's" pilot house; and a little after noon a shot struck the sight-hole of the pilot house and blinded Lieut. Worden. The "Monitor" withdrew in the confusion consequent upon the wounding of her commanding officer; and the "Merrimac" after a short wait for her adversary steamed back to Norfolk. There were virtually no casualties on either side. After the evacuation of Norfolk by the Confederates on the 9th of May Commodore Josiah Tattnall, then in command of the "Merrimac," being unable to take her up the James, sank her. The "Monitor" was lost in a gale off Cape Hatteras on the 31st of December 1862.

Though the battle between the two vessels was indecisive, its effect was to "neutralize" the "Merrimac," which had caused great alarm in Washington, and to prevent the breaking of the Federal blockade at Hampton Roads; in the history of naval warfare it may be regarded as marking the opening of a new era—the era of the armoured warship. On the 3rd of February 1865 near Fortress Monroe on board a steamer occurred the meeting of President Lincoln and Secretary Seward with Confederate commissioners which is known as the Hampton Roads Conference (see LINCOLN, ABRAHAM). At Sewell's Point, on Hampton Roads, in 1907 was held the Jamestown Tercentennial Exposition.

See James R. Soley, The Blackader and the Cruisers (New York, 1890); Frank Leslie's Illustrated History of the Civil War, vol. i. (New York, 1887); chap. ii. of Frank M. Bennett's _The Monitor and the Navy under Steam_ (Boston, 1900); and William Swinton, _Twelve Decisive Battles of the War_ (New York, 1867).
From “hanaper” is derived the modern “hamper,” a wicker or rush basket used for the carriage of game, fish, wine, &c. The verb “to hamper,” to entangle, obstruct, hinder, especially used of disturbing the mechanism of a lock or other fastening so as to prevent its proper working, is of doubtful origin. It is probably connected with a root seen in the Tél. *hempja*, to restrain or Gen. *hemmen*, to clog.

HANAU, a town of Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Main, 14 m. by rail E. from Frankfurt and at the junction of lines to Friedberg, Bebra and Aschaffenburg. Pop. (1905) 31,037. It consists of an old and a new town. The streets of the former are narrow and irregular, but the latter, founded at the end of the 16th century by fugitive Walloons and Netherlanders, is built in the form of a pentagon with broad streets crossing at right angles, and possesses seven, fine squares, around which may be mentioned the marketplace, adorned with handsome fountains at the four corners. Among the principal buildings are the ancient castle, formerly the residence of the counts of Hanau; the church of St John, dating from the 17th century, with a handsome tower; the old church of St Mary, containing the burial vault of the counts of Hanau; the church in the new town, built by the Walloons in the beginning of the 17th century in the form of two intersecting circles; the Roman Catholic church, the synagogue, the theatre, the barracks, the arsenal and the hospital. Its educational establishments include a classical school, and a school of industrial arts. There is a society of natural history and an historical society, both of which possess considerable libraries and collections. Hanau is the birthplace of the brothers Grimm, to whom a monument was erected here in 1896. In the neighbourhood of the town are the palace of Philippsruhe, with an extensive park and large orangeries, and the spa of Wilhelmsbad.

Hanau is the principal commercial and manufacturing town in the province, and stands next to Cassel in point of population. It manufactures ornaments of various kinds, cigars, leather, paper, clothing, boots and shoes, silk, hats, and woolen cloth, hats, silk, gloves, stockings, ropes and matches. Diamond cutting is carried on and the town has also foundries, breweries, and in the neighborhood extensive powder-mills. It carries on a large trade in wool, wine and corn, in addition to its articles of manufacture.

From the number of urns, coins and other antiquities found near Hanau it would appear that it owes its origin to a Roman settlement. It received municipal rights in 1393, and in 1528 it was fortified by Count Philip III, who rebuilt the castle. At the end of the 16th century its prosperity received considerable impulse from the accession of the Walloons and Netherlanders. During the Thirty Years' War it was in 1631 taken by the Swedes, and in 1636 it was besieged by the imperial troops, but was relieved on the 13th of June by Landgrave William V. of Hesse-Cassel, on account of which the day is still commemorated by the inhabitants. Napoleon on his retreat from Leipzig defeated the Germans under Marshal Wrede at Hanau, on the 30th of October 1813; and on the following day the allies vacated the town, when it was entered by the French. Early in the 17th century Hanau became the capital of a principality of the Empire, which on the death of Count Reinhard in 1451 was partitioned between the Hanau-Münzenberg and Hanau-Lichtenberg lines, but was reunited in 1642 when the elder line became extinct. The younger line received princely rank in 1696, but as it became extinct in 1736 Hanau-Münzenberg was joined to Hesse-Cassel and Hanau-Lichtenberg to Hesse-Darmstadt. In 1785 the whole province was united to Hesse-Cassel, and in 1803 it became an independent principality. In 1815 it again came into the possession of Hesse-Cassel, and in 1866 it was joined to Prussia.

See R. Wille, Hanau im dreissigjährigen Krieg (Hanau, 1886); and Junghaus, Geschichte der Stadt und des Kreises Hanau (1887).

Hanbury Williams, Sir Charles (1708–1759), English diplomatist and author, was a son of Major John Hanbury (1664–1734), of Pontypool, Monmouthshire, and a scion of an ancient Worcestershire family. His great-great-great-grandfather, Capel Hanbury, bought property at Pontypool and began the family iron-works there in 1565. His father John Hanbury was a wealthy iron-master and member of parliament, who inherited another fortune from his friend Charles Williams of Caerleon, his son's godfather, with which he bought the Coldharbour Abbey lands, where he built and named the Hanbury, or the name of Williams in 1720. He went to Eton, and there made friends with Henry Fielding, the novelist, and, after marrying in 1732 the heiress of Earl Coningsby, was elected M.P. for Monmouthshire (1734–1747) and subsequently for Leominster (1754–1759). He became known as one of the prominent gallants and wits about town, and following Pope he wrote a great deal of satirical light verse, including *Isabella, or the Morning* (1740), satires on Ruth Darlington and Pulleney (1741–1742), *The Country Girl* (1742), *Lessons for the Day* (1742), *Letter to Mr Dodgley* (1743), &c. A collection of his poems was published in 1763 and of his works in 1822. In 1746 he was sent on a diplomatic mission to Dresden, which led to further employment in this capacity; and through Henry Fox's influence he was sent as envoy to Berlin (1750), Dresden (1751), Vienna (1753), Dresden (1754) and St Petersburg (1755–1757); in the latter case he was the instrument for a plan for the alliance between England, Russia and Austria, which finally broke down, to his embarrassment. He returned to England, and committed suicide on the 2nd of November 1759, being buried in Westminister Abbey. He had two daughters, the eldest of whom married William Capel, 4th earl of Essex, and was the mother of the 4th earl. The Coldbrook estates went to Charles's brother, George Hanbury-Williams, to whose heirs it descended. See William Cox's *Historical Tour in Monmouthshire* (1801), and T. Seccombe's article in the *Dict. Nat. Biog.* with bibliography.

Hancock, John (1737–1793), American Revolutionary statesman, was born in that part of Braintree, Massachusetts, now known as Quincy, on the 23rd of January 1737. After graduating from Harvard in 1754, he entered the mercantile house of his uncle, Joseph Hancock, and also adopted him, and on whose death, in 1764, he fell heir to a large fortune and a prosperous business. In 1765 he became a selectman of Boston, and from 1766 to 1772 was a member of the Massachusetts general court. An event which is thought to have greatly influenced Hancock's subsequent career was the seizure of the sloop “Liberty” in 1768 by the customs officers for discharging, without paying the duties, a cargo of Madeira wine consigned to Hancock. Many suits were thereupon entered against Hancock, which, if successful, would have caused the confiscation of his estate, but which undoubtedly enhanced his popularity with the Whig element and increased his resentment against the British government. He was a member of the committee appointed in a Boston town meeting immediately after the “Boston Massacre” in 1770 to demand the removal of British troops from the town. In 1774 and 1775 he was president of the first and second Provincial Congresses respectively, and he shared with Samuel Adams the leadership of the Massachusetts Whigs in all the irregular measures preceding the War of American Independence. The famous expedition sent by General Thomas Gage of Massachusetts to Lexington and Concord on the 19th-19th of April 1775 had for its object, besides the destruction of materials of war at Concord, the capture of Hancock and Adams, who were temporarily staying at Lexington, and these two leaders were expressly excepted in the proclamation of pardon issued on the 12th of June by Gage, their offences, it was said, being “of too flagitious a nature to admit of any other consideration than that of condign punishment.” Hancock was a member of the Continental Congress from 1775 to 1786, was president of it from May 1775 to October 1777, being the first to sign the Declaration of Independence, and was a member of the Confederation Congress in 1785–1786. In 1778 he commanded, as major-general of militia, the Massachusetts troops who participated in the Rhode Island expedition. He was a member of the Massachusetts Constitutional Convention of 1779–1780, became the first governor of the state, and served from 1780 to 1785 and again from 1787 until his death. Although
at first unfriendly to the Federal Constitution as drafted by the convention at Philadelphia, he was finally won over to its support, and in 1788 he presided over the Massachusetts convention which ratified the instrument. Hancock was not by nature a leader, but he wielded great influence on account of his wealth and social position, and was liberal, public-spirited, and, as his repeated election—the elections were annual—to the governorship attests, exceedingly popular. He died at Quincy, Mass., on the 8th of October 1793.

See Abram E. Brown, John Hancock, His Book (Boston, 1898), a work consisting largely of extracts from Hancock's letters.

HANCOCK, WINFIELD SCOTT (1824–1886), American general, was born on the 14th of February 1824, in Montgomery county, Pa. He graduated in 1844 at the United States Military Academy, where his career was creditable but not distinguished. On the 1st of July 1844 he was brevetted, and on the 18th of June 1866 commissioned second lieutenant. He took part in the later movements under Winfield Scott against the city of Mexico, and was brevetted first lieutenant for "gallant and meritorious conduct." After the Mexican war he served in the West, in Florida and elsewhere; was married in 1850 to Miss Alma Russell of St Louis; became first lieutenant in 1853, and assistant-quartermaster with the rank of captain in 1855. The outbreak of the Civil War found him in California. At his own request he was ordered east, and on the 23rd of September 1861, immediately after the invasion of the Potomac, he was assigned to command a brigade in the Army of the Potomac. He took part in the Peninsula campaign, and the handling of his troops in the engagement at Williamsburg on the 5th of May 1862, was so brilliant that McClellan reported "Hancock was superb," an epithet always afterwards applied to him. At the battle of Antietam he was placed in command of the first division of the II. corps, and in November he was made major-general of volunteers, and about the same time was promoted major in the regular army. In the disastrous battle of Fredericksburg (q.v.), Hancock showed his soldiers that he continued to be the one officer that were ordered to storm Marye's Heights. Out of the 5000 men in his division fell at Chancellorsville his division received both on the 2nd and the 3rd of May the brunt of the attack of Lee's main army. Soon after the battle he was appointed commander of the II. corps.

The battle of Gettysburg (q.v.) began on the 1st of July with the defeat of the left wing of the Army of the Potomac and the death of General Reynolds. About the middle of the afternoon Hancock arrived on the field with orders from Meade to assume command, and to decide whether to continue the fight there or to fall back. He decided to stay, rallied the retreating troops, and held Cemetery Hill and Ridge until the arrival of the main body of the Federal Army. During the second day's battle he commanded the left centre of the Union army, and after General Sickles had been wounded, the whole of the left wing. In the third day's battle he commanded the left centre, upon which fell the full brunt of Pickett's charge, one of the most famous incidents of the war. Hancock's superb presence and power over men never shone more clearly than when, as the 150 guns of the Confederate army opened the attack he calmly rode along the lines of battle ordering his soldiers that he continued to be the one officer that were ordered to storm Marye's Heights. Out of the 5000 men in his division fell at Chancellorsville his division received both on the 2nd and the 3rd of May the brunt of the attack of Lee's main army. Soon after the battle he was appointed commander of the II. corps. Hancock, a city of Houghton county, Michigan, U.S.A.

See also History of the Second Corps, by the same author (1886).

HANCOCK, a city of Houghton county, Michigan, U.S.A. on Portage Lake, opposite Houghton. Pop. (1890) 1772; (1900) 4950, of whom 1400 were foreign-born; (1910) 8981. Hancock is served by the Mineral Range, the Copper Range, the Chicago, Milwaukee & St Paul, and the Duluth, South Shore & Atlantic railways (the last two send their trains in over the Mineral Range tracks), and by steamboats through the Portage Lake Canal which connects with Lake Superior. Hancock is connected by a bridge and an electric line with the village of Houghton (pop. in 1910, 5113), the county-seat of Houghton county and the seat of the Michigan College of Mines. Incorporated in 1889. Hancock has excellent parks, and a marine and general hospital. The city is the seat of a Finnish Lutheran Seminary—there are many Finns in and near Hancock, and a Finnish newspaper is published here. Hancock is in the Michigan copper region—the Quincy, Franklin and Hancock mines are in or near the city—and the mining, working and shipping of copper are the leading industries; among the city's manufactures are mining machinery, lumber, bricks and beer. The municipality owns and operates the waterworks. The electric-lighting plant, the gas plant and the street railway are owned by private corporations. Hancock was settled in 1859, was incorporated as a village in 1875, and was chartered as a city in 1903.

HAND, FERDINAND GOTHELFF (1786–1854), German classical scholar, was born at Plauen in Saxony on the 15th of February 1786. He studied at Leipzig, in 1810 became professor
at the Weimar gymnasium, and in 1717 professor of philosophy and Greek literature in the university of Jena, where he remained till his death on the 14th of March 1788. His last work by which Hand is chiefly known is the " unfinished" edition of the treatise of Tursellinus (Orazio Torsellino, 1545-1599) on the Latin particles (Tursellinus, seu de particulis Latinis commentarii, 1829-1841). Like his treatise on Latin style (Lehrbuch des lateinischen Stils, 3rd ed. by H. L. Schmitt, 1880), it is too abstruse and philosophical for the use of the ordinary student. Hand was also an enthusiastic musician, and in his "Anleitung zur Tonkunst" (1837-1841) he was the first to introduce the subject of musical aesthetics.

The first part of the last-named work has been translated into English by W. E. Lawson (Aesthetics of Musical Art, or The Beautiful in Music, 1880), and B. Sears's Classical Studies (1849) contains a biography of the Origin and Progress of the Latin Language, abridged from Hand's work on the subject. There is a memoir of his life and work by G. Queck (Jena, 1852).

**Händel (hand common to Teutonic languages; cf. Ger. Hand, Goth, handus), the terminal part of the human arm from below the wrist, and consisting of the fingers and the palm.**

The word is also used of the prehensile tendons of the limbs in certain other animals (see **ANATOMY: Appendicular, Superficial and articular; Splanchnos: **Appendicular, and such articles as MUSCULAR SYSTEM and NERVOUS SYSTEM). There are many transferred applications of "hand," both as a substantive and in various adverbial phrases. The following expression is sometimes quoted: candidate or authority, agency, source, chiefly in such expressions as "in the hands of," "by hand," "at hand." From the position of the hands at the side of the body, the word means "direction," e.g., on the right, left hand, cf. "at hand." The hand as given in betrothal or marriage has been from early times the symbol of marriage as it is also of oaths. Other applications are to laborers engaged in manual occupations, the members of the crew of a ship, to a person who has some special skill, as in the phrase, "old parliamentary hand," and to the pointers of a clock or watch and to the number of cards dealt to each player in a card game. As a measure of length the term "hand" is now only used in the measurement of horses, it is equal to 4 in.

The name "hand of glory," is given to a hand cut from the corpse of a hanged criminal, dried in smoke, and used as a charm or talisman, for the finding of treasures, &c. The expression is the translation of the Fr. main de gloire, at a corruption of the O. Fr. mande gloire, mandegoire, i.e. mandragora, the mandrake, to the root of which many magical properties are attributed.

**Händel, George Frederick** (1685-1759), English musical composer, German by origin, was born at Halle in Lower Saxony, on the 23rd of February 1685. His name was Händel, but, like most 18th-century musicians who travelled, he compromised with its pronunciation by foreigners, and when in Italy spelt it Hendl, and in England (where he became naturalized) accepted the version Handel, which is therefore correct for English writers, while Händel remains the correct version in Germany. His father was a barber-surgeon, who disapproved of music, and wished George Frederick to become a lawyer. A friend smuggled a clavichord into the attic, and on this instrument, which is inaudible behind a closed door, the little boy practised secretly. Before he was eight his father went to visit a son by a former marriage who was a valet-de-chambre to the duke of Saxe-Weissenfels. The little boy begged in vain to go also, and at last ran after the carriage on foot so far that he had to be taken. The music acquaintance with the court musicians and contrived to practise on the organ when he could be overheard by the duke, who, immediately recognizing his talent, spoke seriously to the father, who had to yield to his arguments. On returning to Halle Handel became a pupil of Zachau, the cathedral organist, who gave him a thorough training as a composer and as a performer on keyd instruments, the oboe and the violin. Six very good trios for two oboes and bass, which Handel wrote at the age of ten, are extant; and when he himself was shown them by an English admirer who had discovered them, he was much amused and remarked, "I wrote like the devil in those days, and chiefly for the oboe, which was my favourite instrument." His master also of course made him write an enormous amount of vocal music, and he had to produce a motet every week. By the time he was twelve Zachau thought he could teach him no more, and accordingly the boy was sent to Berlin, where he made a great impression at the court.

His father, however, thought fit to decline the proposal of the elector of Brandenburg, afterwards King Frederick I. of Prussia, to send the boy to Italy in order afterwards to attach him to the court at Berlin. German court musicians, as late as the time of Mozart, had hardly enough freedom to satisfy a man of independent character, and the elder Händel had not yet given up hope of his son's becoming a lawyer. Young Handel, therefore, returned to Halle and resumed his work with Zachau. In 1697 his father died, but the boy showed great filial piety in finishing the ordinary course of his education, both general and musical, and even entering the university of Halle in 1702 as a law student. But in that year he succeeded to the post of organist at the cathedral, and after his "probation year in that capacity he departed to Hamburg, where the young George Händel, as is well known, was brought under the direction of its founder, Reinhold Keiser. Here he became friends with Matheson, a prolific composer and writer on music. On one occasion they set out together to go to Lübeck, where a successor was to be appointed to the post left vacant by the great organist Buxtehude, who was retiring on account of his extreme age. Handel and Matheson made much music on this occasion, but did not compete, because they found that the successful candidate was required to accept the hand of the elderly daughter of the retiring organist.

Another adventure might have had still more serious consequences. At a performance of Matheson's opera Cleopatra at Hamburg, Handel refused to give up the conductor's seat to the composer when the latter returned to his usual post at the harpsichord after singing the part of Antony on the stage. The dispute led to a duel outside the theatre, and, but for a large button on Handel's coat which intercepted Matheson's sword, there would have been no Messiah or Israel in Egypt. But the young men remained friends, and Matheson's writings are full of the most valuable facts for Handel's biography. He offers an interesting story of how the "interminable cantatas" of famous works under the name Messiah, and Handel, both in London and in Italy, had to the best of my knowledge, never put in hand to compose the Messiah, but the name Messiah was always given to the Messiah, and the Messiah was always a favourite work.

The Messiah, however, is an exception to this rule, for it was composed "at the request of the then Elector of Hanover, who was then in London." The Messiah was the first of Handel's compositions to be performed in public, and it was received with great success. The performance was given in the chapel of the Elector of Hanover, and the audience consisted of some of the nobility and gentry of London, who were all extremely pleased with the performance. The composer received a sum of money as a reward for his trouble, and the performance was repeated several times, with the same success. The Messiah is a grand oratorio, composed of a number of short movements, each of which is intended to represent a different scene or subject from the story of the Passion. The movements are all in the key of G major, and are written in a style which is both simple and effective. The Messiah is a work of great beauty and power, and it is one of the most beloved of all Handel's compositions.
It is either the devil or the Saxon! " Then there is a story of Corelli's coming to grief over a passage in Handel's overture to Il Triunfo del tempo, in which the violins went up to A in altissimo. Handel impatiently snatched the violin to show Corelli how the passage ought to be played, and Corelli, who had never written or played beyond the third position in his life (this passage being in the seventh), said gently, "My dear Saxon, this music is in the French style, which I do not understand." In Italy Handel produced two operas, Rodrigo and Agrippina, the latter a very important work, of which the succeeding passage was performed forty-four years afterwards as that of his last original oratorio, Jephtha. He also produced two oratorios, La Resurrezione, and Il Triunfo del tempo. This, forty-six years afterwards, formed the basis of his last work, The Triumph of Time and Truth, which contains no original matter. All Handel's early works contain material that he used often with very little alteration later on, and, though the famous "Lascia ch'io pianga," does not occur in Almira, it occurs note for note in Agrippina and the two Italian oratorios. On the other hand the cantata Acti, Galatea e Pfolomeo has nothing in common with Actis and Galatea. Besides these larger works there are several choral and solo cantatas of which the earliest, such as the great Dixit Dominus, show in their extra- vagon vocal difficulty how radical was the change which Handel's Italian experience so rapidly effected in his methods.

Handel's success in Italy established his fame and led to his receiving at Venice in 1709 the offer of the post of Kapellmeister to the elector of Hanover, transmitted to him by Baron Kielmansegge, his patron and staunch friend of later years. Handel at the time contemplated a visit to England, and he accepted this offer on condition of leave of absence being granted to him for that purpose. To England accordingly Handel journeyed after a short stay at Hanover, arriving in London towards the close of 1710. He came as a composer of Italian opera, and earned his first success at the Haymarket with Rinaldo, composed, to the consternation of the hurried librettist, in a fortnight, and first performed on the 24th of February 1711. In this opera the aria "Lascia ch'io pianga" found its final home. The work was produced with the utmost magnificence, and Addison's delightful review of it in the Spectator poked fun at it from an unmusical point of view in a way that sometimes curiously foreshadows the criticisms that Gluck might have made on such things at a later period. The success was so great, especially for Walsh the publisher, that Handel proposed that Walsh should compose the next opera, and that he should publish it. He returned to Hanover at the close of the opera season, and composed a good deal of vocal chamber music for the princess Caroline, the step-daughter of the elector, besides the instrumental works known to us as the oboe concertos. In 1712 Handel returned to London and spent a year with Walsh, a rich musical amateur, in Barn Elms, Surrey. Three more years were spent in Burlington, in the neighbourhood of London. He evidently was but little inclined to return to Hanover, in spite of his duties to the court there. Two Italian operas and the Utrecht Te Deum written by the command of Queen Anne are the principal works of this period. It was somewhat awkward for the composer when his deserted master came to London in 1714 as George I. of England. For some time Handel did not venture to appear at court, and it was only at the intercession of Baron Kielmansegge that his pardon was obtained. By his advice Handel wrote the Water Music which was performed at a royal water party on the Thames, and it so pleased the king that he at once received the composer into his good graces and granted him a salary of £500 a year. Later Handel became music master to the little princesses and was given an additional £200 by the princess Caroline. In 1716 he followed the king to Germany, where he wrote a second German Passion to the popular poem of Brockes, a text which, divested of its worst features, forms the basis of several of the arias in Bach's Passion according to St John. This was Handel's last work to a German text.

On his return to England he entered the service of the duke of Chandos as conductor of his concerts, receiving a thousand pounds for his first oratorio Esther. The music which Handel wrote for performance at "Cannons," the duke of Chandos's residence at Edgeware, is comprised in the first version of Esther, Acts and Galatea, and the twelve Chandos Anthems, which are compositions approximately in the same form as Bach's church cantatas but without any systematic use of choral tunes. The fashionable Londoner would travel 9 miles in those days to the little chapel of Whitchurch to hear Handel's music, and all that now remains of the magnificent scene of these visits is the church, which is the parish church of Edgeware. In 1730 Handel appeared again in a public capacity as impresario of the Italian opera at the Haymarket theatre, which he managed for the institution called the Royal Academy of Music. Senesino, a famous singer, to engage whom Handel especially journeyed to Dresden, was the mainstay of the enterprise, which opened with a highly successful performance of Handel's opera Radamisto. To this time belongs the famous rivalry between Handel and Buononcini, a melodious Italian composer whom many thought to be the greater of the two. The controversy has been perpetuated in John Byrom's lines:

"Some say, compared to Buononcini
That Mynheer Handel's but a niny;
Others aver that he to Handel
Is scarcely fit to hold a candle.

And strangers often fancy the be
'Twixt tweedle-dum and tweedle-dee.'"

It must be remembered that at this time Handel had not yet asserted his greatness as a chorale writer; the fashionable ideas of music and musicianship were based entirely upon success in Italian opera, and the contest between the rival composers was waged on the basis of works which have fallen into almost as complete an oblivion in Handel's case as in Buononcini's. None of Handel's forty-odd Italian operas can be said to survive, except in some two or three detached arias out of each opera; arias which reveal their essential qualities far better in isolation than when performed in groups of between twenty and thirty on the stage, as interruptions to the action of a classical drama to which nobody paid the slightest attention. But even within these limits Handel's artistic resources were too great to leave the issue in doubt; and when Handel wrote the third act of an opera Musco Sceno, of which Buononcini and Ariosti 1 wrote the other two, his triumph was decisive, especially as Buononcini soon got into discredit by failing to defend himself against the charge of producing as a prize-madrigal of his own a composition which proved to be by Lotti. At all events Buononcini left England. Handel remained more than ten years without a rival in his ventures as an operatic composer. He was not, however, without a rival as an impresario; and the hostile competition of a rival company which obtained the services of the great Farinelli and also induced Senesino to desert him, led to his bankruptcy in 1737, and to an attack of paralysis caused by anxiety and overwork. The rival company also had to be dissolved from want of support, so that Handel's misfortunes must not be attributed to any failure to maintain his position in the musical world. Handel's artistic conscience was that of the most easy-going opportunist, or he would never have continued till 1752 to work in a field that gave so little scope for his genius. But the public seemed to want operas, and, if opera had no scope for his genius, at all events he could supply better operas with greater rapidity and ease than any three other living composers working together. And this he naturally continued to do so long as it seemed to be the best way to keep up his reputation. But with all this artistic opportunism he was not a man of tact, and there are numerous stories of the type of his holding the great prima donna Cuzzoni at arm's-length out of a window and threatening to drop her unless she consented to sing a song which she had declared unsuitable to her style.

Already before his last opera, Deidamia, produced in 1741, Handel had been making a growing impression with his oratorios.

1 Chrysander says Mattei instead of Ariosti.
HANDEL

In these, freed from the restrictions of the stage, he was able to give scope to his genius for choral writing, and so to develop, or rather revive, that art of chorus singing which is the normal outlet for English musical talent. In 1726 Handel had become a naturalized Englishman, and in 1733 he began his public career as a composer of English texts by producing the second and larger version of Esther at the King's theatre. This was followed early in the same year by Deborah, in which the size of the chorus was much greater. In July he produced Athaliah at Oxford, the first work in which his characteristic double choruses appear. The share of the chorus increases in Saul (1738); and Israel in Egypt (also 1738) is practically entirely a choral work, the solo movements, in spite of their fame, being as perfunctory in character as they are few in number. It was not unnatural that the public, who still considered Italian opera the highest, because the most modern form of musical art, obliged Handel at subsequent performances of this gigantic work to insert more arias.

The Messiah was produced at Dublin on the 13th of April 1742. Samson (which Handel preferred to the Messiah) appeared at Covent Garden on the 2nd of March 1744; Belshazzar at the King's theatre, 27th of March 1745; the Occasional Oratorio (chiefly a compilation of the earlier oratorios, but with a few important new numbers), on the 14th of February 1746 at Covent Garden, where all his later oratorios were produced; Judas Maccabaeus on the 1st of April 1747; Joshua on the 9th of March 1748; Alexander Balus on the 23rd of March 1748; Solomon on the 17th of March 1749; Susanna, spring of 1749; Timotheus, a grand opera by Dehobah, in which the share appointed by its cold reception, on the 16th of March 1750; Jephtha (strictly speaking, his last work) on the 26th of February 1752, and The Triumph of Time and Truth (transcribed from Il Triunfo del tempo with the addition of many later favourite numbers), 1757. Other important works, indistinguishable in artistic form from oratorios, but on secular subjects, are Alexander's Feast, 1736; Ode for St Cecilia's Day (words by Dryden); L'Allegro, il Penseroso ed il Moderato (the words of the third part by Jennens), 1740; Semele, 1744; Hercules, 1745; and The Choice of Hercules, 1751.

By degrees the enmity against Handel died away, though he had many troubles. In 1745 he had again become bankrupt; but, although he had no rival as a composer of choral music, it was possible for his enemies to give balls and banquets on the nights of his oratorio performances. As with his first bankruptcy, so in his later years, he showed scrupulous sense of honour in discharging his debts, and he continued to work hard to the end of his life. He had not only completely recovered his financial position by the year 1750, but he must have made a good deal of money; for he then presented an opera to the Foundling Hospital, and opened it with a performance of the Messiah on the 15th of May. In 1751 his sight began to trouble him; and the autograph of Jephtha, published in facsimile by the Händelgesellschaft, shows pathetic traces of this in his handwriting,1 and so affords a most valuable evidence of his methods of composition, all the accompaniments, recitatives, and less essential portions of the work being evidently filled in long after the rest. He underwent unsuccessful operations, one of them by the same surgeon who had operated on Bach's eyes. There is evidence that he was able to see at intervals during the last years, but his sight practically never returned after May 1752. He continued superintending performances of his works and writing new arias for them, or inserting revised old ones, and he attended a performance of the Messiah a week before his death, which took place, according to the Public Advertiser of the 16th of April, not on Good Friday, the 13th of April, according to his own pious wish and according to common report, but on the 14th of April 1759. He was buried in Westminster Abbey; and his monument is by L. F. Roubillic,1 the same sculptor who modelled the marble statue erected in 1739 in Vauxhall Gardens, where his works had been frequently performed.

Handel was a man of high character and intelligence, and his interest was not confined to his own art exclusively. He liked the society of politicians and literary men, and was a great admirer of pictures and articles of vertu. His power of work was enormous, and the Händelgesellschaft's edition of his complete works fills one shelf and parts of two others. He succeeded to the works of Bach and Beethoven together.

No one has more successfully popularized the greatest artistic ideals than Handel; no artist is more disconcerting to critics who imagine that a great man's mental development is easy to follow. Not even Wagner effected a greater transformation in the possibilities of dramatic music than Handel effected in oratorio, yet we have seen that Handel was the very opposite of a reformer. He was not even conservative, and he hardly took the pains to ascertain what an art-form was, so long as something externally like it would convey his idea. But he never failed to convey his idea, and, if the hybrid forms in which he conveyed it had no historic influence and no typical character, they were none the less accurate in each individual case. The same aptness and the same absence of method are conspicuous in his style. The popular idea that Handel's style is easily recognizable comes from the fact that he overshadowed all his predecessors and contemporaries, except Bach, and so makes us regard typical 18th-century Italian and English style as Handelian, instead of regarding Handel's style as typical Italian 18th-century. Nothing in music requires more minute, expert knowledge than the shifting of the various peculiarities of Handel's style from the mass of contemporary formulae which in his inspired pages he absorbed, and which in his uninspired pages absorbed him.

His easy mastery was acquired, like Mozart's, in childhood. The later sonatas for two oboes and bass which he wrote in his eleventh year are, except in their diffuseness and an occasional slip in grammar, indistinguishable from his later works, and they show a boisterous inventiveness worthy of Mozart's work at the same age. Such early choral works, as the Dixit Dominus (1707), show the ill-regulated power of his choral writing before he assimilated Italian influences. Its practical difficulties are at least as extravagant as Bach's, while they are not accounted for by any corresponding originality and necessity of idea; but the grandeur of the scheme and nobility of thought is already that for which Handel so often in later years found the simplest and easiest adequate means of expression that music has ever attained. His eminently practical genius soon formed his vocal style, and long before the period of his great oratorios, such works as The Birthday Ode for Queen Anne (1713) and Alcina, (1734) display a Handelian style of immense power and grandeur. The only drawback to his practical genius was that it led him to bury perhaps half of his finest melodies, and nearly all the secular features of interest in his treatment of instruments and of the ari form, in that deplorable limbo of vanity, the 18th-century Italian opera. It is not true, as has been alleged against him, that his operas are in no way superior to those of his contemporaries; but neither is it true that he stirred a finger to improve the condition of dramatic musical art. He was no slave to singers, as is amply testified by many anecdotes. Nor was he bound by the operative conventions of the time. In Teseo he not only wrote an opera in five acts where custom prescribed three, but also broke a much more plausible rule in arranging that each character should have two arias in succession. He also showed a feeling for expression and style which led him to write arias of types which singers might not expect. But he never made any innovation which had the slightest bearing upon the stage-craft of opera, for he never concerned himself with any artistic question beyond the matter in hand; and the matter in hand was not to make dramatic music, or to make the story interesting or intelligible, but simply to provide a series of beautiful arias and duets, wherein singers could display their abilities and spectators find distraction from the monotony of so large a dose of the ari form (which

---

1 By a dramatic coincidence Handel's blindness interrupted him during the writing of the chorus, "How dark, oh Lord, are Thy decrees, . . . all our joys to sorrow turning . . . as the night succeeds the day."
was then the only possibility for solo vocal music) in the gorgeousness of the dresses and scenery.

When the question arose how a musical entertainment of this kind could be managed in a theatre without protests from the bishop of London, Handelian oratorio came into being as a matter of course. But though Handel was an opportunist he was not shallow. His artistic sense seized upon the natural possibilities which arose as soon as the music was transferred from the stage to the concert platform; and his first English oratorio, Esther (1720), beautifully shows the transition. The subject is as nearly secular as any that can be extracted from the Bible, and the treatment was based on Racine's Esther, which was much discussed at the time. Handel's oratorio was reproduced in an enlarged version in 1733 at the King's theatre: the princess royal wished for scenery and action, but the bishop of London protested. And the choruses, of which in the first version there are already no less than ten, are on the one hand operatic and uneclesiastical in expression, until the last, where polyphonic work on a large scale first appears; but on the other hand they are all much too long to be sung by heart, as is necessary in operas. In fact, the turning-point in Handel's development is the emancipation of the chorus from theatrical limitations. This had as great effect upon his few but important secular English works as upon his other oratorios. Semele, Galatea, Hercules, are in fact secular oratorios; the choruses in them are not ecclesiastical, but it is large, independent and polyphonic.

We must remember, then, that Handel's scheme of oratorio is operatic in its origin and has no historic connexion with such principles as might have been generalized from the practice of the German Passion music of the time; and it is sufficiently astonishing that the chorus should have so readily assumed its proper place in a scheme which the public certainly regarded as a sort of Lenten biblical opera. And, although the chorus owes its origin to 'the necessity of development' to the disappearance of theatrical necessities, it becomes no less powerful as a means of dramatic expression (as opposed to dramatic action) than as a purely musical resource. Already in Athalia the "Hallelujah" chorus at the end of the first act is a marvel of dramatic truth. It is sung by Israelites almost in despair beneath usurping tyranny; and accordingly it is a severe double fugue in a minor key, expressive of devout courage at a moment of depression. On purely musical grounds it is no less powerful in throwing into the highest possible relief the ecstatic solemnity of the psalm with which the second act opens. Now this sombre "Hallelujah" chorus is a very convenient illustration of Handel's originality, and the point in which his creative power really lies. It was not originally written for its situation in Athalia, but it was chosen for it. It was originally the last chorus of the second version of the anthem, As pouts the Hart, from the autograph of which it is missing because Handel cut out the last pages in order to insert them into the manuscript of Athalia. The inspiration in Athalia thus lies not in the creation of the chorus itself, but in the choice of it.

In choral music Handel made no more innovation than he made in arias. His sense of fitness in expression was of little use to him in opera, because opera could not become dramatic until musical form became capable of developing and blending emotions in all degrees of climax in a way that may be described as pictorial and not merely decorative (see Music; Sonata-forms; and Instrumentation). But in oratorio there was not the least necessity for reforming any art-forms. The ordinary choral resources of the time had perfect expressive possibilities where there were no actors to keep waiting, and where no dresses and scenery need distract the attention of the listener. When last, ordinary decorum dictated an attitude of reverent attention towards the subject of the oratorio, then the man of genius could find such a scope for his real sense of dramatic fitness as would make his work immortal.

In estimating Handel's greatness we must think away all orthodox musical and progressive prejudices, and learn to apply the lessons critics of architecture and some critics of literature seem to know by nature. Originality, in music as in other arts, lies in the whole, and in a sense of the true meaning of every part. When Handel wrote a normal double fugue in a minor key on the words of the 'Hallelujah' strain, he made all events know what a vigorous and dignified thing an 18th-century double fugue could be. In putting it at the end of a melancholy psalm he showed his sense of the value of the minor mode. When he put it in its situation in Athalia he showed as perfect a sense of dramatic and musical fitness as could well be found in art. Now it is obvious that in works like oratorios (which are dramatic schemes vigorously but loosely organized by the putting together of some twenty or thirty complete pieces of music) the proper conception of originality will be very different from that which we find in the works of great composers of lyrical, operatic or symphonic music. When we add to this the characteristics of a method like Handel's, in which musical technique has become a masterly automatism, it becomes evident that our conception of originality must be at least as broad as that which we would apply in the criticism of architecture. The disadvantages of the want of such a conception have been aggravated by the dearth of general knowledge of the structure of musical art; a knowledge which shows that the parallel we have suggested between music and architecture, as regards the nature of originality, is no mere fancy.

In every art there is an antithesis between form and matter, which becomes reconciled only when the work of art is perfect in its execution. And, whatever this perfection, the antithesis must always remain in the mind of the artist and critic to this extent, that some part of the material seems to be the special subject of technical rule rather than another. In the plastic and literary arts one type of this antithesis is more or less permanently maintained in the relation between subject and treatment. The mere fact that these arts express themselves by representing things that have some previous independent existence, helps to keep the idea of the subject apart from the subject in the mind of the artist, and to prevent the subject from being looked upon as the perfection of treatment than in novelty of subject. But in music we have no permanent means of deciding which of many aspects we shall call the subject and which the treatment. In the 16th century the a priori form existed mainly in the practice of basing almost every melodic detail of the work on phrases of Gregorian chant or popular song, treated for the most part in terms of very definitely regulated polyphonic design, and on harmonic principles regulated in almost every detail by the relation between the melodic aspects of the church modes and the necessity for their unison repetition in the process of imitation. In the 17th century the idea of the subject is largely a matter which presents a contrast between the text and the music, and the treatment of the music is as important a part of the subject as the text itself. In modern music such a relation between form and matter, prescribing as it does for every aspect at every moment both of the shape and the texture of the music, would exclude the element of invention altogether. In 16th-century music it by no means had that effect. An inventive 16th-century composer is as clearly distinguishable from a dull one as a good architect from a bad. The originality of the composer resides, in 16th-century music as in all art, in his whole work; but naturally his conception of property and ideas will not extend to themes or isolated passages. That man is entitled to an idea who can show what it means, or who can make it mean what he likes. Let him wear the giant's robe if it fits him. And it is merely a local difference in point of view which makes us think that there is property in themes and no property in forms. Nowadays we happen to regard the shape of a whole composition as its form, and its theme as its matter. And, as artistic organization becomes more complex and heterogeneous, the need of the broadest and most forcible possible outline of design is more pressing; so that in what we choose to call form we are willing to sacrifice all conception of originality for the sake of general intelligibility, while we insist upon complete originality in those thematic details which we are pleased to call matter. But, if this explains, it does not excuse our setting up a criterion for musical originality which can be accepted by no intelligent critics of other arts, and which is completely upset by the study of any music earlier than the beginning of the 19th century.
The difficulty many writers have found in explaining the subject of Handel’s “plagiarisms” is not entirely accounted for by mere lack of these considerations; but the grossest con-
fusion of ideas as to the difference between cases in point involves this day, and many discussions which have been raised in regard to the ethical aspect of the question are frankly absurd.1 It has been argued, for instance, that great injustice was done to Buononcini over his unfortunate affair with the prize madrigal, while his great rival was allowed the credit of *Israel in Egypt,* which contains a considerable number of entire choruses (besides hosts of themes) by earlier Italian and German writers.2 The very idea of Handelian oratorio is that of some three hours of music, religious or secular, arranged, like opera, in the form of a colossal entertainment, and with high dramatic and emotional interest imparted to it, if not by the telling of a story, at all events by the nature and development of the subject. It seems, moreover, to be entirely overlooked that the age was an age of pasticcios. Nothing was more common than the organization of some such solemn entertainment by the skilful grouping of favourite pieces. Handel himself never revived one of his oratorios without inserting in it favourite pieces from his other works as well as several new numbers; and the story is well known that the turning point in Gluck’s career was his perception of the true possibilities of dramatic music from the failure of a pasticcio in which he had set some rather definite expressive music to situations for which it was not originally designed. The success of an oratorio was due to the appropriateness of its contrasts, altogether of course with the mastery of its detail, whether that detail were new or old; and there are many gradations between a réchauffé of an early work like *The Triumph of Time and Truth,* or a pasticcio with a few original numbers like the *Occasional Oratorio,* and such works as *Samson,* which was entirely new except that the “Dead March” first written for it was immediately replaced by the more famous one imported from *Saul.* That the idea of the pasticcio was extremely familiar to the age is shown by the practice of announcing an oratorio as “new and original,” a term which would obviously be meaningless if it were as much a matter of course as it is at the present day, and which, if used at all, must obviously so apply to the whole work without forbidding the composer from gratifying the public with the reproduction of one or two favourite arias. But of course the question of originality becomes more serious when the imported numbers are not the composer’s own. And here it is very noticeable that Handel derived no credit, either with his own public or with us, from whole movements that are not of his own designing. In *Israel in Egypt,* the choruses “Egypt was glad when they departed,” “And I will exalt Him,” “Thou sentest forth Thy Wrath,” and “The Earth swallowed them,” are without exception the most colourless and unattractive pieces of severe counterpoint to be found among Handel’s works; and it is very difficult to fathom his motive in copying them from obscure pieces by Erba and Kaspar Kerl, unless it be that he wished to train his audiences to a better understanding of a polyphonic style. He certainly felt that the greatest possibilities of music lay in the higher choral polyphony, and so in *Israel in Egypt* he designed a work consisting almost entirely of choruses, and may have wished in these instances for severe contrapuntal movements which he had not time to write, though he could have done them far better himself. Be this as it may, these choruses have certainly added nothing to the popularity of a work of which the public from the outset complained that there was not enough solo music; and what effect they have is merely to throw Handel’s own style into relief. To draw any parallel between the theft of such unattractive details in the grand and intensely Handelian scheme of *Israel in Egypt* and Buononcini’s alleged theft of a prize madrigal is merely ridiculous. Handel himself, if he had any suspicion that contemporaries did not take a sane architect’s view of the originality of large musical schemes,3 probably gave himself no more trouble about their scruples on this matter than about other forms of musical banality.

The *History of Music* by Burney, the cleverest and most refined musical critic of the age, shows in the very freshness of its musical scholarship how completely un scholarly were the musical ideas of the time. Burney was incapable of regarding choral music as other than a highly improving academic exercise in which he himself was proficient; and for him Handel is the great opera-writer whose choral music will reward the study of the curious. If Handel had attempted to explain his methods to the musicians of his age, he would probably have found himself alone in his opinions as to the property of musical ideas. He did not trouble to explain, but he made no concealment of his sources. He left his whole musical library to his copyist, and it was from this that the sources of his work were discovered. And when the whole series of plagiarisms is studied, the fact forces itself upon us that nothing except themes and forms which are common property in all 18th-century music, has yet been discovered as the source of any work of Handel’s which is not felt as part of a larger design. Operatic arias were never felt as parts of a whole. The opera was a concert on the stage, and it stood or fell, not by a dramatic propriety which it notoriously neglected to consider at all, but by the popularity of its arias. There is no aria in Handel’s operas which is traceable to another composer. Even in the oratorios there is no solo number in which more than the themes are pillared, for in oratorios the solo work still appealed to the popular criterion of novelty and individual attractiveness. And when we leave the question of copying of whole movements and come to that of the adaptation of passages, and still more of themes, Handel shows himself to be simply on a line with Mozart. Jahn compares the opening of Mozart’s *Requiem* with that of the first chorus in Handel’s *Funeral Anthem.* Mozart recreates at least as much from Handel’s already perfect frame-work as Handel ever idealized from the inorganic fragments of earlier writers. The double counterpoint of the Kyrie in Mozart’s *Requiem* is still more indisputably identical with that of the last chorus of Handel’s *Joseph,* and if the themes are common property their combination certainly is not. But the true plagiarist is the man who does not know the meaning of the ideas he copies, and the true creator is he in whose hands they remain or become true ideas. The theme “He led them forth like sheep” in the chorus “But as for his people” is one of the most beautiful in Handel’s works, and the bare statement that it comes from a serenade by Stradella seems at first rather shocking. But, to any one who knew Stradella’s treatment of it first, Handel’s would come as a revelation actually greater than if he had never heard the theme before. Stradella makes nothing more of it, and therefore presumably sees nothing more in it than an agreeable and essentially frivolous little tune which lends itself to comic dramatic purpose by a wearisome repetition throughout eight pages of patchy aria and instrumental ritornello at an ever-increasing pace. What Handel sees in it is what he makes of it, one of the most solemn and poetic things in music. Again, it may be very shocking to discover that the famous opening of the “Hailstone chorus” comes from the patchy and facetious overture to this same serenade, with which it is identical for ten bars all in the tonic chord (representing, according to Stradella, someone knocking at a door). And it is no doubt yet more shocking that the chorus “He spake the word, and

1 Much light would be thrown on the subject if some one sufficiently ignorant of architecture were to make researches into Sir Christopher Wren’s indebtedness to Italian architects.
there came all manner of flies" contains no idea of Handel's own except the realistic swarming violin-passages, the general structure, and the vocal colouring; whereas the rhythmic and melodic figures of the voice parts come from an equally patchy sinfonia concertata in Stradella's work. The real interest of these things ought not to be denied either by the misstatement that the materials adapted are mere common property, nor by the satiric remark that thus Handel's schemes are "obtrusive." The converse process is equally instructive. In the short Carillon choruses in Saul where the Israelithen women welcome David after his victory over Goliath, Handel uses a delightful instrumental tune which stands at the beginning of a Te Deum by Urio, from which he borrowed an enormous amount of material in Saul, L'Allegro, the Dettingen Te Deum and other works. Urio's idea is first to make a jubilant and melodious noise from the lower register of the strings, and then to bring out a flourish of high trumpets as a contrast. He has no other use for his beautiful tune, which indeed would not bear more elaborate treatment than he gives it. The trumpets fall into their register as a contrast, and the countermelody secures one repetition of the tune, after which no more is heard of it. It has none of the solemnity of church music, and its value as a contrast to the flourish of trumpets depends, not upon itself, but upon its position in the orchestra. Handel did not see in it a fine opening for a great ecclesiastical work, but he saw in it an admirable expression of popular jubilation, and he understood how to bring out its character with the liveliest sense of climax and dramatic interest by taking it at its own value as a popular tune. So he uses it as an instrumental interlude accompanied with a jingle of carillons, while the daughters of Israel sing to a square-cut tune those praises of David which aroused the jealousy of Saul. But now turn to the opening of the Dettingen Te Deum and see what splendid use is made of the other side of Urio's idea, the contrast between a jubilant noise in the lowest part of the scale and the blaze of trumpets at an extreme height. In the fourth bar of the Dettingen Te Deum we find the same florid trumpet figures as we find in the fifth bar of Urio's, but at the first moment they are on oboes. The first four bars beat a tattoo on the tonic and dominant, with the whole orchestra including violins and drums, in the lowest possible position and in a stirring rhythm with a boldness and simplicity characteristic only of a stroke of genius. Then the oboes appear with Urio's trumpet flourish; the momentary contrast is at least as brilliant as Urio's; and as the oboes are immediately followed by the same figures on the trumpets themselves the contrast gains incalculably in subtlety and climax. Moreover, these flourishes are more melodious than the broad and massive opening, instead of being, as in Urio's scheme, incomparably less so. Lastly, Handel's is a decorative rhythm in which every subsequent inner part and bass that occurs at every half close and full close throughout the movement, especially where the trumpets are used. And thus every detail of his scheme is rendered alive with a rhythmic significance which the elementary nature of the theme prevents from ever becoming obtrusive.

No other great composer has ever so overcrowded his life with occasional and mechanical work as Handel, and in no other artist are the qualities that make the difference between inspired and uninspired pages more difficult to analyse. The liberties of his oratorios are full of absurdities, except when they are derived in every detail from Scripture, as in the Messiah and Israel in Egypt, or from the classics of English literature, as in Samson and L'Allegro. These absurdities, and the obvious fact that in every oratorio Handel writes many more numbers than are desirable for one performance, and that he was continually in later performances adding, transferring and cutting out solo numbers and often choruses as well—all this may seem at first sight to militate seriously against the view that Handel's originality and greatness consists in his grasp of the works as wholes, but in reality it strengthens that view. These things militate against the perfection of the whole, but they would militate against the absolute beauty of the whole in the hands of a lesser artist (as in all true art) greater than the sum of its parts. That they are felt as absurdities and defects already shows that Handel created in English oratorio a true art-form on the largest possible scale.

There never has been a time when Handel has been overrated, except in so far as other composers have been neglected. But no composer has suffered so much from pious misinterpretation and the popular admiration of misleading externals. It is not the place here to dilate upon the burial of Handel's art beneath the "mammoth" performances of the Handel Festivals at the Crystal Palace; nor can we give more than a passing reference to the effects of "additional accompaniments" in the style of an altogether later age, started most unfortunately by Mozart (whose share in the work has been very much misinterpreted and corrupted) and continued in the middle of the 19th century by musicians of every degree of intelligence and refinement, until all sense of unity of style has been lost and does not seem likely to be recovered as a general element in the popular appreciation of Handel for some time to come. But in spite of this, Handel was too great in all his works to increase the number of composers, if we value the criteria of architectonic power, a perfect sense of style, and the power to rise to the most sublime height of musical climax by the simplest means.

Handel's important works have all been mentioned above with their dates, and a separate detailed list does not seem necessary. He was an extremely rapid worker, and his latest score was dated the last day by day for half a century. From this we learn that the Messiah was sketched and scored within twenty-one days, and that even Jephtha, with an interruption of nearly four months besides several other delays caused by Handel's failing sight, was begun and finished within seven months, representing hardly five weeks' actual writing. Handel's extant works may be roughly summarized from the edition of the Händelgesellschaft as 41 Italian operas, 2 Italian oratorios, 2 German Passions, 18 English oratorios, 4 English secular oratorios, 4 English secular cantatas, and a few other small works. English and Italian, of the type of oratorio or incidental dramatic work. Seven scores of Te Deum; (Handel's) 4 Te Deum and Utrecht Te Deum and Jubilate; 4 coronation anthems; 3 volumes of English anthems (Chandos Anthems); 1 volume of Latin church music; 3 volumes of Italian vocal chamber-music; 5 volumes of Handel's oratorio and oratorio scores; 37 instrumental duets and trios (sonatas), and 4 volumes of orchestral music and organ concertos (about 40 works). Precise figures are impossible as there is no means of drawing the line between pasticcios and original works. The instrumental music is especially and again and again as overtures to operas and oratorios and anthems.

The complete edition of the German Händelgesellschaft suffers from being the work of one man who would not recognize that his task was beyond any single man's power. The best arrangements of the vocal scores are undoubtedly those published by Novello that are not based on additional accompaniments. None is absolutely trustworthy, and those of the editor of the German Händelgesellschaft are sad proofs of the uselessness of expert library-scholarship without a sound musical training. Yet Chrysander's service to the research of Handel's life and works is incalculable; he mentioned his discovery of authentic trombone parts in Israel in Egypt as one among many of his priceless contributions to musical history and aesthetics.

(D. F. T.)

**HANDFASTING** (A.S. handfastning, pledging one's hand), primarily the O. Eng. synonym for betrothal (q.v.), and later a peculiar form of temporary marriage at one time common in Scotland, the only necessary ceremony being the verbal pledge of the couple while holding hands. The pair thus handfasted was free to live according to their wishes for a year and a day. If then they so wished, the temporary marriage could be made permanent; if not, they could go their several ways without reproach, the child, if any, being supported by the party who objected to further cohabitation.

**HANDICAP** (from the expression hand in cap, referring to drawing lots), a disadvantageous condition imposed upon the
superior competitor in sports and games, or an advantage allowed the inferior, in order to equalize the chances of both. The character of the handicap depends upon the nature of the sport. Thus in horse-racing the better horse must carry the heavier weight. In foot races the inferior runners are allowed to start at certain distances in advance of the best (or "scratch") man, according to their previous records. In distance competitions (weights, fly-casting, jumping, &c.) the inferior contestants add certain distances to their scores. In time contests (yachting, canoe-racing, &c.) the weaker or smaller competitors subtract certain periods of time from that actually made, reckoned by the clock. In stroke contests (e.g. golf) a certain number of strokes are subtracted from or added to the scores, according to the strength of the players. In chess and draughts the stronger competitor may play without one or more pieces. In court games (tennis, lawn-tennis, racquets, &c.) and in billiards certain points, or percentage of points, are accorded the weaker players.

Handicapping was applied to horse-racing as early as 1680, though the word was not used in this connexion much before the middle of the 19th century. A "Post and Handy-Cap Match" was made not long after the "stake handicap" of 1754. A reference to something similar in Germany and Scandinavia, called Freimarkt, may be found in Germania, vol. xix.

Competitions in which handicaps are given are called handicap-

ets or handicaps. There are many systems which depend upon the whim of the individual competitors. Thus a tennis player may offer to play against his inferior with a smaller-bottle instead of a racquet; or a golfer to play with only one club; or a chess-player to make his moves without seeing the board.

The name "handicap" was taken from an ancient English game, to which Pepys, in his Diary under the date of the 18th of September 1660, thus refers: "Here some of us fell to handi-
cap, a sport that I never knew before, which was very good." This game, which became obsolete in the 19th century, was described as early as the 14th in Piers the Plowman under the name of "New Faire." It was originally played by three persons, one of whom proposed to "challenge," or exchange, some piece of property belonging to another for something of his own. The challenge being accepted an umpire was chosen, and all three put up a sum of money as a forfeit. The two players then placed their right hand in a cap, or in their pockets, in which there was loose money, while the umpire proceeded to describe the two objects of exchange, and to declare what sum of money the owner of the inferior article should pay as a bonus to the other. This declaration was made as rapidly as possible and ended with the invitation, "Draw, gentlemen!" Each player then withdrew and held out his hand, which he opened. If both hands contained money the exchange was effected according to the conditions laid down by the umpire, who then took the forfeit money for himself. If neither hand contained money the exchange was declined and the umpire took the forfeit money. If only one player signified his acceptance of the exchange by holding money in his hand, he was entitled to the forfeit-money, though the exchange was not made.

Handicap was also the name of an old game at cards, now obsolete. It resembled the game of Loo, and probably derived its name from the ancient sport described above.

HANDSEL, the O. Eng. term for earnest money; especially in Scotland the first money taken at a market or fair. The termination sel is the modern "sell." "Hand" indicates, not a bargain by shaking hands, but the actual putting of the money into the hand. Handseals were also presents or earnest of good-
will in the North; thus Handsel Monday, the first Monday in the year, an occasion for universal tipping, is the equivalent of the English Boxing day.

HANDSWORTH. (1) An urban district in the Handsworth parliamentary division of Staffordshire, England, suburban to Birmingham on the north-west. Pop. (1891), 32,756; (1901) 52,027. (See BIRMINGHAM.) (2) An urban district in the Hallamshire parliamentary division of Yorkshire, 4 m. S.E. of Sheffield. Pop. (1901), 13,404. In this neighbourhood are extensive collieries and quarries.

HANDWRITING. Under Palaeography and Writing, the history of handwriting is dealt with. Questions of handwriting come before legal tribunals mainly in connexion with the law of evidence. In Roman law, the authenticity of documents was proved first by the attesting witnesses; in the second place, if they were dead, by comparison of handwritings. It was necessary, however, that the document to be used for purposes of comparison either should have been executed with the formalities of a public document, or should have its genuineness established. If these conditions are fulfilled, the question was apparently, in the latter case, left to experts, who were sworn to give an impartial opinion (Code, 4, 21, 20). Proof by com-
parison of handwritings, with a reference if necessary to three experts as to the handwriting which is to be used for the purposes of comparison, is provided for in the French Code of Civil Procedure (arts. 193 et seq.); and in Quebec (Code Proc. Civ. arts. 392 et seq.) and St Lucia (Code Civ. Proc. arts. 286 et seq.), the French system has been adopted with modifications. Com-
parison by witnesses of disputed writings with any writing of the judge to be genuine is accepted in England and Ireland in all legal proceedings whether criminal or civil, including proceedings before arbitrators (Denman Act, 28 & 29 Vict. c. 18, 55, 1, 8); and such writings and the evidence of witnesses respecting the same may be submitted to the court and jury as evidence of the genuineness or otherwise of the writing in dispute. It is admitted in Scotland (where the term comparatio literarum is in use) and in most of the American states, subject to the same conditions. In England, prior to the Common Law Procedure Act of 1854 (now superseded by the act of 1865), documents irrelevant to the matter in issue were not admissible for the sole purpose of comparison, and this rule has been adopted, and is still adhered to, in some of the states in America. In England, as in the United States, and in most legal systems, the primary and best evidence of handwriting is that of the writer himself. Witnesses who saw him write the writing in question, or who are familiar with his handwriting either from having seen him write or from having corresponded with him, or otherwise, may be called. In cases of disputed handwriting the court will accept the evidence of experts in handwriting, i.e. persons who have an adequate knowledge of handwriting, whether acquired in the way of their business or not, such as solicitors or bank cashiers (R. v. Silverlock, 1894, 2 Q.B. 766). In such cases the witness is required to compare the admitted handwriting of the person whose writing is in question with the disputed document, and to state in detail the similarities or differences as to the formation of words and letters, on which he bases his opinion as to the genuineness or otherwise of the disputed document. By the use of the magnifying glass, or, as in the Parnell case, by enlarged photographs of the letters alleged to have been written by Mr. Parnell, the court and jury are much assisted to appreciate the grounds on which the conclusions of the expert are founded. Evidence of this kind, being based on opinion and theory, needs to be very carefully weighed, and the dangers of implicit reliance on it have been illustrated in many cases (e.g. the Beck case in 1904; and see Seaman v. Netherclift, 1876, 1 C.P.D. 340). Evidence by comparison of handwriting comes in principally either in default, or in corroboration, of the other modes of proof.

Where attestation is necessary to the validity of a document, e.g. wills and bills of sale, the execution must be proved by one or more of the attesting witnesses, unless they are dead or cannot be produced, when it is sufficient to prove the signature of one of them to the attesting clause (28 & 29 Vict. c. 18, s. 7). Signatures to certain public and official documents need not in general be proved (see e.g. Evidence Act, 1845, ss. 1, 2).

cation (Albany, 1892); Hagan, Disputed Handwriting (New York, 1894); also the article Identification. (A. W. R.)
HANG-CHOW-FU.—HANGING.

HANG-CHOW-FU, a city of China, in the province of Chekiang, 2 m. N.W. of the Tsien-tang-Kiang, at the southern terminus of the Grand canal, by which it communicates with Peking. It lies about 100 m. S.W. of Shanghai, in 36° 20' N., 120° 27' E. Towards the west is the Si-hu or Western Lake, a beautiful sheet of water, with its banks and islands studded with villas, monuments and gardens, and its surface traversed by gaily-painted pleasure boats. Exclusive of extensive and flourishing suburbs, the city has a circuit of 12 m.; its streets are well paved and clean; and it possesses a large number of arches, public monuments, temples, hospitals and colleges. It has long ranked as one of the great centres of Chinese commerce and Chinese learning. In 1869 the silk manufactures alone were said to give employment to 60,000 persons within its walls, and it has an extensive production of gold and silver work and tinsel paper. On one of the islands in the lake is the great Wen-lan-ko or pavilion of literary assemblies, and it is said that at the examinations for the second degree, twice every three years, from 10,000 to 15,000 candidates come together. In the north-east corner of the city is the Nestorian church which was noted by Marco Polo, the façade being “elaborately carved and the gates covered with elegantly wrought iron.” There is a Roman Catholic mission in Hangchow, and the Church Missionary Society, the American Presbyterians, and the British and Foreign Bible Societies have stations there, the last three of the inland navigation rules. These canals pass through the richest and most populous districts of China, and in particular lead into the great silk-producing districts. They have for many centuries been the highway of commerce, and afford a cheap and economical means of transport. Hangchow lies at the head of the large estuary of that name, which is, however, too shallow for navigation by steamers. The estuary or bay is funnel-shaped, and its configuration produces at spring tides a “tide” or tidal wave, which at its maximum reaches a height of 12 to 20 ft. The local dialect differs from all three under the inland navigation rules.

Hang-chow-fu is the Kinsai of Marco Polo, who describes it as the finest and noblest city in the world, and speaks enthusiastically of the number and splendour of its mansions and the wealth and luxury of its inhabitants. According to this authority it had a circuit of 100 m., and no fewer than 12,000 bridges and 3000 baths. The name Kinsai, which appears in Wassaf as Khanzai, in Ibn Battuta as Khansa, in Odoric of Pordenone as Camsay, and elsewhere as Cannay and Cassay, is really a corruption of the Chinese King-see, capital, the same word which is still applied to Peking. From the 10th to the 13th century (960-1272) the city, whose real name was then Lin-nan, was the capital of southern China and the seat of the Sung dynasty, which was dethroned by the Mongolians shortly before Marco Polo’s visit. Up to 1861, when it was laid in ruins by the Taipings, Hangchow continued to maintain its position as one of the most flourishing cities in the empire.

Hanging, one of the modes of execution under Roman law (ad furcam donnatio), and in England and all the other countries the usual form of capital punishment. It was derived by the Anglo-Saxons from their German ancestors (Tacitus, Germ. 12). Under William the Conqueror this mode of punishment is said to have been disused in favour of mutilation: but Henry I. decreed that all thieves taken should be hanged (i.e. summarily without trial), and by the time of Henry II. hanging was fully established as a punishment for homicide; the “right of pit and gallows” was ordinarily included in the royal grants of jurisdiction to lords of manors and to ecclesiastical and municipal corporations. In the middle ages every town, abbey, and nearly all the more important manorial lords had the right of hanging. The clergy had rights, too, in baptism to the gallows. Thus William the Conqueror invested the abbot of Battle Abbey with authority to save the life of any criminal. From the end of the 12th century the jurisdiction of the royal courts gradually became exclusive; as early as 1212 the king’s justices sentenced offenders to be hanged (Seld. Soc. Publ. vol. i.; Select Pleas of the Crown, p. 111), and in the Gloucester eyre of 1221 instances of this sentence are numerous (Maitland, pl. 72, 101, 228). In 1241 a nobleman’s son, William Maric, was hanged for piracy. In the reign of Edward I. the abbot of Peterborough set up a gallows at Cloghillong, Notts, and hanged a thief. In 1279 two hundred and eighty Jews were hanged for clipping coin.

The mayor and the porter of the South Gate of Exeter were hanged for their neglect in leaving the city gate open at night, thereby aiding the escape of a murderer. Hanging in time superseded all other forms of capital punishment for felony. It was substituted in 1790 for burning as a punishment of female traitors and in 1814 for beheading as a punishment for male traitors. The older and more primitive modes of carrying out the sentence were by hanging from the bough of a tree (“the father to the bough, the son to the plank,” or from a scaffold. Formerly in the worst cases of murder it was customary after execution to hang the criminal’s body in chains near the scene of his crime. This was known as “gibbetting,” and, though by no means rare in the earliest times, was, according to Blackstone, no part of the legal sentence. Holinished is the authority for the statement that sometimes culprits were gibbetted alive, but this is doubtful. It was not until 1752 that gibbetting was recognized by statute. The act (25 Geo. II. c. 37) empowered the judges to direct that the dead body of a murderer should be hung by the neck until dead, and was accompanied by dissection and anatomicization, and forbade burial except after dissection (see Foster, Crown Law, 107, Earl Ferrers’ case, 1760). The hanging in chains was usually on the spot where the murder took place. Pirates were gibbetted on the sea shore or river bank. The act of 1752 was repealed in 1828, but the alternatives of dissection or hanging in chains were re-enacted and continued in use until abolished as to dissection by the Anatomy Act in 1832, and as to hanging in chains in 1834. The last murderer hung in chains seems to have been James Cook, executed at Leicester on the 10th of August 1832. The iron used on that occasion are preserved in Leicester prison. Instead of chains, gibbet iron, a framework to hold the limbs together, were sometimes used. At the town hall, Rye, Sussex, are preserved the iron used in 1742 for one John Breed who murdered the mayor.

The earlier modes of hanging were gradually disused, and the present system of hanging by use of the drop is said to have been inaugurated at the execution of the fourth Earl Ferrers in 1760. The form of scaffold now in use has under the gallows a drop constructed on the principle of the trap-doors on a theatrical stage, upon which the convict is placed under the gallows, a white cap is placed over his head, and when the halter has been properly adjusted the drop is withdrawn by a mechanical contrivance worked by a lever, much like those in use on railways for moving points and signals. The convict falls into a pit,
the length of the fall being regulated by his height and weight. Death results not from real hanging and strangulation, but from a fracture of the cervical vertebrae. Compression of the windpipe by the rope and the obstruction of the circulation aid in the fatal result. Recently the noose has had imbedded in its fibre a metal eyelet which is adjusted tightly beneath the ear and considerably expedites death. The convict is left hanging until life is extinct.

It was long considered essential that executions, like trials, should be public, and be carried out in a manner calculated to inspire evil-doers. Partly to this idea, partly to the desire of revenge and temporal punishment of sin, is probably due the rigour of the administration of the English law. But the methods of execution were unseemly, as delineated in Hogarth's print of the execution of the idle apprentice, and were ineffectual in reducing the bulk of crime, which was augmented by the inefficiency of the police and the uncertainty and severity of the law, which rendered persons tempted to commit crime either reckless or confident of escape. The scandals attending public executions led to an attempt to alter the law in 1841, although many protests had been made long before, among them those of the novelist Fielding. But perhaps the most forcible and effectual was that of Charles Dickens in his letters to The Times written after mixing in the crowd gathered to witness the execution of the Mannings at Horsemonger Lane gaol in 1849. After his experiences he came to the conclusion that public executions attracted the depraved and those affected by morbid curiosity; and that the spectacle had neither the solemnity nor the salutary effect which should attend the execution of public justice. His views were strongly resisted in some quarters; and it was not until 1868 (31 & 32 Vict. c. 24) that they were accepted. The last public hanging in England was that of Michael Barrett for murder by causing an explosion at Clerkenwell prison with the object of releasing prisoners confined there for treason and felony (Ann. Reg., 1868, p. 63). Under the act of 1868 (31 & 32 Vict. c. 24), which was adapted from similar legislation already in force in the Australian colonies convicted murderers are hanged within the walls of a prison. The sentence of the court is that the convict "be hanged by the neck until he is dead." The execution of the sentence devolves on the sheriff of the county (Sheriffs Act 1857, s. 13). As a general rule the sentence is carried out in England and Ireland at 8 a.m. on a week-day (not being Monday), in the week following the third Sunday after sentence was passed. In old times prisoners were often hanged on the day after sentence was passed; and under the act of 1752 this was made the rule in cases of murder. A public notice of the date and hour of execution must be posted on the prison walls not less than twelve hours before the execution and must remain until the inquest is over. The persons required to be present are the sheriff, the gaoler, chaplain and surgeon of the prison, and such other officers of the prison as the sheriff requires; justices of the peace for the jurisdiction to which the prison belongs, and such of the relatives, or such other persons as the sheriff or visiting justices allow, may also attend. It is usual to allow the attendance of some representatives of the press.

The death of the prisoner is certified by the prison surgeon, and a declaration that judgment of death has been executed is signed by the sheriff. An inquest is then held on the body by the coroner for the jurisdiction and a jury from which prison officers are excluded. The certificate and declaration, and a duplicate of the coroner's inquiry also, are sent to the home office, or in Ireland to the lord-lieutenant, and the body of the prisoner is interred in quicklime within the prison walls if space is available. It is also the practice to toll the bell of the parish or other neighbouring church, for fifteen minutes before and fifteen minutes after the execution. The hoisting of the black flag at the moment of execution was abolished in 1902. The regulations as to execution are printed in the Statutory Rules and Orders, Revised ed. 1904, vol. x. (lits. Prison E. and Prison 1). The act of 1868 applies only to executions for murder; but since the passing of the act there have been no executions for any other crime within the United Kingdom. (See further Capital Punishment.)

In Scotland execution by hanging is carried out in the same manner as in England and Ireland, but under the supervision of the magistrates of the burgh in which it is decreed to take place, and in lieu of the inquest required in England and Ireland an inquiry is held at the instance of the procurator-fiscal before a sheriff or sheriff substitute (act of 1868, s. 13). The procedure at the execution is governed by the act of 1868 and the Scottish Prison Rules, rr. 465-469 (Stat. Rules and Orders, Revised ed. 1904, tit. Prison S).

British Dominions beyond the Seas.—Throughout the King's dominions hanging is the regular method of executing sentence of death. In India the Penal Code superseded the modes of punishment under Mahomedan law, and s. 368 of the Criminal Procedure Code of 1898 provides that sentence of death is to be executed by hanging by the neck.

In Canada the sentence is executed within a prison under conditions very similar to those in England (Criminal Code, 1892; ss. 936-943).

In Australia the execution takes place within the prison walls, at a time and place appointed by the governor of the state. See Queensland Code, 1893, s. 664; Western Australia Code, 1901, s. 665; in these states no inquest is held. In Western Australia the governor may cause an aboriginal native to be executed outside a prison. In New Zealand the only mode of execution is by hanging within a prison (Act of 1883).

United States.—In all the states except New York, Massachusetts, New Jersey, North Carolina, Mississippi, Virginia, and Ohio (see Electrocution) persons sentenced to death are hanged. In Utah the criminal may elect to be shot instead.

The only countries, whose law is not of direct English origin, which maintain the capital punishment by hanging are Japan, Austria, Hungary, and Russia.

HANGÖ—HANKA, a port and sea-bathing resort situated on the promontory of Hangöd, to the extreme south-west of Finland. Hangö owes its commercial importance to the fact that it is practically the only winter ice-free port in Finland, and is thus of value both to the Finnish and the Russian sea-borne trade. When incorporated in 1874 it had only a few hundred inhabitants; in 1900 it had 2901 and it has now over six thousand (1906 in 1904). It is connected by railway with Helsingfors and Tammerfors, and is the centre of the Finnish butter export, which now amount to over 6,000,000 yearly. There is a considerable import of coal, cotton, iron and breadstuffs, the chief exports being butter, fish, timber and wood pulp. During the period of emigration, owing to political troubles with Russia, over 12,000 Finns sailed from Hangö in a single year (1901), mostly for the United States and Canada. Hangö now takes front rank as a fashionable watering-place, especially for wealthy Russians, having a dry climate and a fine strand.

HANKA, WENCESLAUS (1791-1861), Bohemian philologist, was born at Horéniowes, a hamlet of eastern Bohemia, on the 10th of June 1791. He was sent in 1807 to school at Kôniggrätz, to escape the conscription, then to the university of Prague, where he founded a society for the cultivation of the Czech language. At Vienna, where he afterwards studied law, he established a Czech periodical; and in 1813 he made the acquaintance of Joseph Dobrowsky, the eminent philologist. On the 16th of September 1817 Hanka had alleged that he had discovered some ancient Bohemian manuscript poems (the Königinhol.MS.), of the 13th and 14th century in the church tower of the village of Krakodvor, or Königinhol. These were published in 1818, under the title Krakodworsky Rukopis, with a German translation by Quentell. Great doubt, however, was felt as to their genuineness, and Dobrowsky, by pronouncing The Judgment of Libussa, another manuscript found by Hanka, an "obvious fraud," confirmed the suspicion. Some years afterwards Dobrowsky saw fit to modify his decision, but by modern Czech scholars the MS. is regarded as a forgery. A translation into English, The Manuscript of the Queen's Court, was made by Wratislaw in 1852. The originals were presented by the discoverer to the Bohemian museum at Prague, of which he was appointed librarian in 1858. In 1848 Hanka, who was an ardent Panslavist, took part in the Slavonic congress and
other peaceful national demonstrations, being the founders of the political society Slovenska Lipa. He was elected to the imperial diet at Vienna, but declined to take his seat. At the close of the winter of 1848 he became lecturer and in 1849 professor of Slavonic languages at the University of Prague, where he died on the 12th of January 1861.

His chief works and editions are the following: Hankový Písne (Prague, 1815), a volume of poems; Starobylá Skladání (1817-1826), in 5 vols.—a collection of old Bohemian poems, chiefly from unpublished manuscripts; A Short History of the Slavonic Peoples (1818); A Bohemian Grammar (1822) and A Polish Grammar (1839)—(these grammars were composed on a plan suggested by Dobrovsky; see p. 351).—(2) Bohemia; part of the Gospels from the Reims manuscript in the Gotic character (1840); the old Bohemian Chronicles of Dalimil (1838) and A History Charles IV., by Procop Lupác (1848); Evangelium Ostromiz (1853).

HANKOW ("Mouth of the Han"), the great commercial centre of the middle portion of the Chinese empire, and since 1858 one of the principal places opened to foreign trade. It is situated on the northern side of the Yangtsze-kiang at its junction with the Han river, about 600 m., W. of Shanghai in 30° 32' 51" N., 114° 19' 55" E., at a height of 150 ft. By the Chinese it is not considered as a harbour, but as a suburb of Shanghai. It is the terminus of a railway between Peking and the Yangtsze, the northern half of the trunk line from Peking to Canton. There is daily communication by regular lines of steamers with Shanghai, and smaller steamers ply on the upper section of the river between Hankow and Ich'ang. The principal article of export continues to be black tea, of which staple Hankow has always been the central market. The bulk of the leaf tea, however, now goes to Russia by direct steamers to Odessa instead of to London as formerly, and a large quantity goes overland via Tientsin and Siberia in the form of brick tea. The quantity of brick tea exported in 1904 was upwards of 10 million lb. The exports which next in value are opium, wood-oil, hides, beans, cotton yarn and raw silk. The population of Hankow, together with the city of Wuchang on the opposite bank, is estimated at 500,000, and the number of foreign residents is about 500. Large iron-works have been erected by the Chinese authorities at Hanyang, a couple of miles higher up the river, and at Wuchang there are two official cotton mills. The British concession, on which the business part of the foreign settlement is built, was obtained in 1861 by a lease in perpetuity from the Chinese authorities in favour of the crown. By 1863 a great embankment and a roadway were completed along the river, which may rise as much as 50 ft. or more above its ordinary levels, and not infrequently, as in 1849 and 1866, lays a large part of the town under water. On the former occasion little was left uncovered but the roofs of the houses. In 1864 a public assay office was established. Sub-leases for a term of years are granted by the crown to private individuals; local control, including the policing of the settlement, is managed by a municipal council elected under regulations promulgated by the British minister in China, and by the authority of the sovereign's orders in council. Foreigners, i.e. non-British, are admitted to become lease-holders on their submitting to be bound by the municipal regulations. The concession, however, gives no territorial jurisdiction. All foreigners, of whatever nationality, are justiciable only before their own consular authorities by virtue of the extra-territorial clauses of their treaties with China. In 1805 a concession, on similar terms to that under which the British is held, was obtained by Germany, and this was followed by concessions to France and Russia. These three concessions all lie on the north bank of the river and immediately below the British. An extension of the British concession backwards was granted in 1898. The Roman Catholics, the London Missionary Society and the Wesleyans have all missions in the town; and there are two missionary hospitals. The total trade in 1904 was valued at £15,401,076 (£9,042,190 being exports and £6,358,886 imports) as compared with a total of £17,183,400 in 1891 and £11,628,000 in 1880.

HANLEY, a market town and parliamentary borough of Staffordshire, England, in the Potteries district, 148 m. N.W. from London, on the North Staffordshire railway. Pop. (1891) 54,945; (1901) 61,599. The parliamentary borough includes the old town of Hanley. The town, which lies on high ground, has handsome municipal buildings, free library, technical and art museum, elementary, science and art schools, and a large park. Its manufactures include porcelain, encaustic tiles, and earthenware, and give employment to the greater part of the population, women and children being employed almost as largely as men. In the neighbourhood coal and iron are obtained. Hanley is of modern development. Its municipal constitution dates from 1857, the parliamentary borough from 1885, and the county borough from 1889. There are considerable gasworks and are two cement works, and the town contains two hospitals. The parliamentary borough includes the town of Burslem. It was formed on the 24th of September, 1837. In 1852 he removed with his father to Cleveland, where the latter established himself in the wholesale grocery business, and the son received his education in the public schools of that city, and at the Western Reserve University. Leaving college before the completion of his course, he became associated with his father in business, and on his father's death (1862) became a member of the firm. In 1867 he entered into partnership with his father-in-law, David D. Yorkes, in the manufacture of chemicals and glass, and due to Hanna's progressive methods that the business of the firm, which became M. A. Hanna & Company in 1877, was extended to include the ownership of a fleet of lake steamships constructed in their own shipyards, and the control and operation of valuable coal and iron mines. Subsequently he became largely interested in street railway properties in Cleveland and elsewhere, and in various banking institutions. In early life he had little time for politics, but after 1886 he became prominent in the affairs of the Republican party in Cleveland, and in 1894 and 1888 was a delegate to the Republican National Convention, in the latter year being associated with William McKinley in the management of the John Sherman canvass. It was not, however, until 1896, when he personally managed the canvass that resulted in securing the Republican presidential nomination for William McKinley at the St Louis Convention (at which he was a delegate), that he became known throughout the United States as a political leader of great adroitness, tact and resourcefulness. Subsequently he became chairman of the Republican National Committee, and managed with consummate skill the campaign of 1896 against William Jennings Bryan and the "free-silver." In March 1897 he was appointed, by Governor Asa S. Bushnell (1834-1904) United States senator from Ohio, to succeed John Sherman. In the senate, to which in January 1898 he was elected for the short term ending on the 3rd of March 1899 and for the succeeding full term, he took part little in the debates, but was recognized as one of the principal advisers of the McKinley administration, and his influence was large in consequence. Apart from politics he took a deep and active interest in the problems of capital and labour, was one of the
organizers (1901) and the first president of the National Civic Federation, whose purpose was to solve social and industrial problems, and on December 1901 became chairman of a permanent board of conciliation and arbitration established by the Federation. After President Roosevelt's policies became defined, Senator Hanna came to be regarded as the leader of the conservative branch of the Republican party and a possible presidential candidate in 1904. He died at Washington on the 15th of February 1904.

HANNAY, JAMES (1827–1873), Scottish critic, novelist and publicist, was born at Dumfries on the 17th of February 1827. His family was of the Hannays of Sorbie, an ancient clan of the name. He entered the navy in 1840 and served till 1845, when he adopted literature as his profession. He acted as reporter on the Morning Chronicle and gradually obtained a connexion, writing for the quarterly and monthly journals. In 1857 Hannay contested the Dumfries burghs in the Conservative interest, but without success. He edited the Edinburgh Courant from 1860 till 1864, when he removed to London. From 1868 till his death on the 8th of January 1873 he was British consul at Barcelona. His letters to the Pall Mall Gazette "From an Englishman in Spain" were held in high appreciation. Hannay's best books are his two naval novels, Singleton Fontenay (1850) and Eustace Conyers (1855); Satire and Satirists (1854); and Essays from the Quarterly Review (1861). Satire not only shows loving appreciation of the great satirists of the past, but is itself instinct with wit and fine satiric power. The book sparkles with epigrams and apposite classical allusions, and contains admirable critical estimates of Horace (Hannay's favourite author). Juvenal, Erasmus, Sir David Lindsay, George Buchanan, Bolleau, Butler, Dryden, Swift, Pope, Churchill, Burns, Byron and Moore.

Among his other works are Biscuits and Greg, Clarét Cup, and Hearts are Trumps (1848); King Dobbs (1849); Sketches in Ultramarine (1853); an edition of the Poems of Edgar Allan Poe, to which he prefixed an essay on the poet's life and genius (1852); Charms, and an interesting account of his contributions to the Edinburgh Courant (1865); A Course of English Literature (1866); Studies on Thackeray (1869); and a family history entitled Three Hundred Years of a Norman House (the Gurneys) (1867).

HANNEN, JAMES HANNEN, BARON (1821–1894), English judge, son of a London merchant, was born at Peckham in 1821. He was educated at St Paul's school and at Heidelberg University, which was famous as a school of law. Called to the bar at the Middle Temple in 1848, he joined the home circuit. At this time he also wrote for the press, and supplied special reports for the Morning Chronicle. Though not eloquent in speech, he was clear, accurate and painstaking, and soon advanced in his profession, passing many more brilliant competitors. He appeared for the claimant in the Shrewsbury peerage case in 1858, when the 3rd Earl Talbot was declared to be entitled to the earldom of Shrewsbury as the descendant of the 2nd earl; was principal agent for Great Britain on the mixed British and American commission for the settlement of outstanding claims, 1853–1855; and assisted in the prosecution of the Fenian prisoners at Manchester. In 1868 Hannen was appointed a judge of the Court of Queen's Bench. In many cases he took a strong position of his own, notably in that of Farrar v. Close (1860), which materially affected the legal status of trade unions and was regarded by unionists as a severe blow to their interests. Hannen became judge of the Probate and Divorce Court in 1872, and in 1875 he was appointed president of the probate and admiralty division of the High Court of Justice. Here he showed himself a worthy successor to Cresswell and Penzance. Many important causes came before him, but he will chiefly be remembered for the manner in which he presided over the Parnell special commission. His influence pervaded the whole proceedings, and it is understood that he personally penned a large part of the voluminous report. Hannen's last public service was in connexion with the Bering Sea inquiry at Paris, when he acted as one of the British arbitrators. In January 1891 he was appointed a lord of appeal in ordinary (with the dignity of a life peerage), but in that capacity he had few opportunities for displaying his powers, and he retired at the close of the session of 1893. He died in London, after a prolonged illness, on the 29th of March 1894.

HANNIBAL ("mercy" or "favour of Baal"), Carthaginian general and statesman, son of Hamilcar Barca (q.v.), was born in 249 or 247 B.C. Destined by his father to succeed him in the work of vengeance against Rome, he was taken to Spain, and while yet a boy gave ample evidence of his military aptitude. Upon the death of his brother-in-law Hasdrubal (221) he was acclaimed commander-in-chief by the soldiers and confirmed in his appointment by the Carthaginian government. After completing the conquest of Spain south of the Ebro, he set himself to begin what he felt to be his life's task, the conquest and humiliation of Rome. Accordingly in 219 he seized some pretext for attacking the town of Saguntum (mod. Murviedro), which stood under the special protection of Rome, and disregarding the protests of Roman envoys, stormed it after an eight months' siege. As the home government, in view of Hannibal's great popularity, did not venture to repudiate this action, the declaration of war which he desired took place at the end of the year.

Collecting a large army of Libyans and Spanish mercenaries which he had at his disposal Hannibal selected the most trustworthy and devoted contingents, and with these determined to execute the daring plan of carrying the war into the heart of Italy by a rapid march through Spain and Gaul. Starting in the spring of 218 he easily fought his way through the northern tribes to the Pyrenees, and by conciliating the Gaulish chiefs on his passage contrived to reach the Rhone before the Romans could take any measures to bar his advance. After outmanoeuvring the natives, who endeavoured to prevent his crossing, Hannibal evaded a Roman force sent to operate against him in Gaul; he proceeded up the valley of one of the tributaries of the Rhone (Isère or, more probably, Durance), and by autumn arrived at the foot of the Alps. His passage over the mountain-chain, at a point which cannot be determined with certainty, though the balance of the available evidence inclines to the Mt Genévre pass, and fair cases can be made out for the Col d'Argentiere and for Mt Cenis, was one of the most memorable achievements of any military force of ancient times. Though the opposition of the natives and the difficulties of ground and climate cost Hannibal half his army, his perilous march brought him directly into Roman territory and entirely frustrated the attempts of the enemy to fight out the main issue on foreign ground. His sudden appearance among the Gauls, moreover, enabled him to detach most of the tribes from their new allegiance to the Romans before the latter could take steps to check rebellion. After allowing his soldiers a brief rest to recover from their exertions Hannibal first secured his rear by subduing the hostile tribe of the Taurini (mod. Turin), and moving down the Po valley forced the Romans by virtue of his superior cavalry to evacuate the plain of Lombardy. In December of the same year he had an opportunity of showing his superior military skill when the Roman commander attacked him on the river Trebia (near Placentia); after wearing down the excellent Roman infantry he cut it to pieces by a surprise attack from an ambush in the flank. Having secured his position in north Italy by this victory, he quartered his troops for the winter on the Gauls, whose zeal in his cause thereupon began to abate. Accordingly in spring 217 Hannibal decided to find a more trustworthy base of operations farther south; he crossed the Apeninnes without opposition, but in the marshy lowlands of the Arno he lost a large part of his force through disease and himself became blind in one eye. Advancing through the uplands of Etruria he provoked the main Roman army to a hasty pursuit, and catching it in a defile on the shore of Lake Trasimenus destroyed it in the waters or on the adjoining slopes (see Trasimene). He had now disposed of the only field force which could check his advance upon Rome, but realizing that without siege engines he could not hope to take the capital, he preferred to utilize his victory by passing into central and southern Italy and exciting a general revolt against the sovereign power. Though closely watched
by a force under Fabius Maximus Cunctator, he was able to carry his ravages far and wide through Italy: on one occasion he was entrapped in the lowlands of Campania, but set himself free by a stratagem which completely deluded his opponent. For the winter he found comfortable quarters in the Apulian plain, into which the enemy dared not descend. In the campaign of 217 Hannibal had failed to obtain a following among the Italians; in the following year he had an opportunity of turning the tide in his favour. A large Roman army advanced into Apulia in order to crush him, and accepted battle on the site of Cannae. Thanks mainly to brilliant cavalry tactics, Hannibal, with much inferior numbers, managed to surround and cut to pieces that whole of this force; moreover, the moral effect of this victory ensured that all the South of Italy had to flee at his cause. Hannibal now received proper material reinforcements from his countrymen at Carthage he might have made a direct attack upon Rome; for the present he had to content himself with subduing the fortresses which still held out against him, and the only other notable event of 216 was the defection of Capua, the second largest city of Italy, which Hannibal made his new base.

In the next few years Hannibal was reduced to minor operations which centred mainly round the cities of Campania. He failed to draw his opponents into a pitched battle, and in the single engagements suffered reverses. As the forces detached under his lieutenants were generally unable to hold their own, and neither his home government nor his new ally Philip V. of Macedon helped to make good his losses, his position in southern Italy became increasingly difficult and his chance of ultimately conquering Rome grew ever more remote. In 212 he gained an important success by capturing Tarentum, but in the same year he lost his hold upon Campania, where he failed to prevent the concentration of three Roman armies. In 211, Hannibal attacked the besieging armies with his full force in 211, and attempted to entice them away by a sudden march through Samnium which brought him within 3 m. of Rome, but caused no alarm than real danger to the city. But the siege continued, and the town fell in the same year. In 210 Hannibal again proved his superiority in tactics by a severe defeat inflicted at Herdonia (mod. Ordonia) in Apulia upon a proconsular army, and in 208 destroyed a Roman force engaged in the siege of Locri Epizephyrii. But with the loss of Tarentum in 209 and the withdrawal of the Romans of Samnium and Lucania, his hold on south Italy was almost lost. In 205 Hannibal was in making his way again into Apulia, where he waited to concert measures for a combined march upon Rome with his brother Hasdrubal (q.v.). On hearing, however, of his brother's defeat and death at the Metaurus he retired into the mountain fastnesses of Bruttium, where he maintained himself for the ensuing years. With the failure of his brother Mago (q.v.) in Liguria (205–203) and of his own negotiations with Philip of Macedon, the last hope of recovering his ascendancy in Italy was lost. In 203, when Scipio was carrying all before him in Africa and the Carthaginian peace-party were arranging an armistice, Hannibal was recalled from Italy by the "patriot" party at Carthage. After leaving a record of his expedition, engraved in Latin and Greek upon brass tablets, in the temple of Juno at Crotona, he sailed back to Africa. His arrival immediately restored the predominance of the war-party, who placed him in command of a combined force of African levies and of his mercenaries from Italy. In 202 Hannibal, after meeting Scipio in a fruitless peace conference, engaged him in a decisive battle at Zama. Unable to cope with his indifferent troops against the well-trained and confident Roman soldiers, he experienced a crushing defeat, which put an end to all resistance on the part of Carthage. Hannibal was still only in his forty-sixth year. He soon showed that he could be a statesman as well as a soldier. Peace having been concluded, he was appointed chief magistrate (suffetes, sofet). The office had become rather insignificant, but Hannibal restored its power and authority. The oligarchy, always jealous of him, had even charged him with having betrayed the interests of his country while in Italy, and neglected to take Rome when he might have done so. The dishonesty and incompetence of these men had brought the finances of Carthage into grievous disorder. So effective were they that Hannibal reform abuses that the heavy tribute imposed by Rome to be collected by insalacts without additional and extraordinary taxation.

Seven years after the victory of Zama, the Romans, alarmed at this new prosperity, demanded Hannibal's surrender. Hannibal thereupon went into voluntary exile. First he journeyed to Tyre, the mother-city of Carthage, and thence to Ephesus, where he was honourably received by Antiochus III. of Syria, who was then preparing for war with Rome. Hannibal soon saw that the king's army was no match for the Romans. He advised him to withdraw his forces and throw a body of troops on the south of Italy, adding that Hannibal could not make much impression on Antiochus, who listened more willingly to courtiers and flatterers, and would not entrust Hannibal with any important charge. In 190 he was placed in command of a Phoenician fleet, but was defeated in a battle off the river Eurymedon.

From the court of Antiochus, who seemed prepared to surrender him to the Romans, Hannibal fled to Crete, but he soon went back to Asia, and sought refuge with Prusias, king of Bithynia.

The Romans were determined to hunt him out, and they sent Flamininus to insist on his surrender. Prusias agreed to give him up, but Hannibal did not choose to fall into his enemies' hands. At Libyssa, on the eastern shore of the Sea of Marmora, he took poison, which, it was said, he had long carried about with him in a ring. The precise year of his death was a matter of controversy. If, as Livy seems to imply, it was 183, he died in the same year as Scipio Africanus.

As to the transcendent military genius of Hannibal there cannot be two opinions. The man who for fifteen years could hold his ground in a hostile country against several powerful armies and a succession of statesmen, was a master of the art of war, a tactician and a statesman of the highest order. No army under his command ever failed of victory, and he was in the strict sense a strategist and legislator; whenever he sowed beside his camps he could not make much impression on Antiochus, who listened more willingly to courtiers and flatterers, and would not entrust Hannibal with any important charge. In 190 he was placed in command of a Phoenician fleet, but was defeated in a battle off the river Eurymedon.

HANNIBAL, a city of Marion county, Missouri, U.S.A., on the Little Osage river, about 130 m. N.W. of St. Louis; Pop. (1890), 12,857; (1900), 12,786, including 930 foreign-born and 1836 negroes; (1910), 18,341. It is served by the Wabash, the Missouri, Kansas & Texas, the Chicago, Burlington & Quincy, and the St Louis & Hannibal railways, and by boat lines to St. Louis, Saint Paul and intermediate points. The business section is in the level bottom-lands of the river, while the residential portion spreads up the banks, which afford fine building sites with beautiful views. Mark Twain’s boyhood was spent at Hannibal, which is the setting of Life on the Mississippi, Huckelberry Finn and Tom Sawyer; Hannibal Cave, described in Tom Sawyer, extends for miles beneath the river and its bluffs. Hannibal has a good public library (1889; the first in Missouri); other prominent buildings are the Federal building, the court house, a city hospital and the high school. The river is here spanned by a long iron and steel bridge connecting with East Hannibal, Ill. Hannibal is the trade centre of a rich agricultural region, and has an important lumber trade, railway shops, and manufactories of furniture, shoes, stoves, flour, cigars, lime, Portland cement and pearl buttons (made from mussel shells) the value of the city’s factory products (in 1870, $670,780) in 1900 to $4,442,009 in 1905, or 65%.

In the vicinity are valuable deposits of crinoid limestone, a coarse white building stone which takes a good polish. The electric-lighting plant is owned and operated by the municipality. Hannibal was laid out as a town in 1870 (its origin going back to Spanish land grants, which gave rise to much litigation) and was first chartered as a city in 1839. The town of South Hannibal was annexed to it in 1843.

HANNINGTON, JAMES (1847–1885), English missionary, was born at Hurstpierpoint, in Sussex, on the 3rd of September 1847. From early life he was a lover of adventure and natural history. At school he made little progress and left at the age of fifteen for his father’s counting-house at Brighton. He had no taste for office work, and much of his time was occupied in commanding a battery of volunteers and in charge of a steam launch. At twenty-one he decided on a clerical career and entered St. Mary’s Hall, Oxford, where he exercised a remarkable influence over his fellow-undergraduates. He was, however, a desultory student, and in 1870 was advised to go to the village of Martinhoe, in Devon, for quiet reading, but distinguished himself more by his daring climbs after sea-gulls’ eggs and his engineering skill in cutting a path for precipitous cliffs to some caves. In 1872 the death of his mother made a deep impression upon him. He began to read hard, took his B.A. degree, and in 1873 was ordained deacon and placed in charge of the small country parish of Trentishoe in Devon. Whilst curate in charge at Hurstpierpoint, his thoughts were turned by the murder of two missionaries on the shores of Victoria Nyanza to mission work. He offered himself to the Church Missionary Society and sailed on the 17th of May 1883, at the head of a party of six, for Zanzibar, and thence set out for Uganda; but, prostrated by fever and dysentery, he was obliged to return to England in 1883. On his recovery he was consecrated bishop of Eastern Equatorial Africa (June 1884), and in January 1885 started again for the scene of his mission, and visited Palestine on the way. On his arrival at Freretown, near Mombasa, he visited many stations then in the neighbourhood. Then, filled with the idea of opening a new route to Uganda, he set out and reached a spot near Victoria Nyanza, lower Kagera river, whereupon, roused the suspicion of the natives, and under King Mwanga, who was lodged in a filthy hut swarming with rats and vermin. After eight days his men were murdered, and on the 29th of October 1885 he himself was speared in both sides, his last words to the soldiers appointed to kill him being, “Go, tell Mwanga I have purchased the road to Uganda with my blood.”

HANNON, the name of a large number of Carthaginian soldiers and statesmen. Of the majority little is known; the most important are the following:

1. Carthage’s navigators, who probably flourished about 500 B.C. It has been conjectured that he was the son of the Hamilcar who was killed at Himera (480), but there is nothing to prove this. He was the author of an account of a coasting voyage on the west coast of Africa, undertaken for the purpose of exploration and colonization. The original, inscribed on a tablet in the Phoenician language, was hung up in the temple of Melkarth on his return to Carthage. What is generally supposed to be a Greek translation of this is still extant, under the title of Periplus, although its authenticity has been questioned. Hannibal’s explorers were advanced beyond Sierra Leone as far as Cape Palmas. On the island where they formed the terminus of his voyage the explorer found a number of hairy women, whom the interpreters called Gorillas (Γοριλλαί).

2. Hann (3rd century B.C.), called "the Great," Carthaginian statesman and general, leader of the aristocratic party and the chief opponent of Hannibal and Hamilcar. He appears to have gained his title from military successes; but out of the rest of the story nothing is known. In 240 B.C. he drove Hamilcar’s veteran mercenaries to rebellion by withholding their pay, and when invested with the command against them was so unsuccessful that Carthage might have been lost but for the exertions of his enemy Hamilcar (q.v.). Hanno subsequently remained at Carthage, exerting all his influence against the democratic party, which, however, had now definitely won the upper hand. During the Second Punic War he advocated peace with Rome, and transferred his allegiance to E. T. when he discovered that Hannibal should be given up to the Romans. After the battle of Zama (202) he was one of the ambassadors sent to Scipio to sue for peace. Remarkably little is known of him, considering the great influence he undoubtedly exercised amongst his countrymen.

Livy xxi. 3 ff., xxii. 12; Polybius i. 67 ff.; Appian, Res. Hisp. 4, 5; Res. Punic. 34, 49, 68.

HANOI, capital of Tongking and of French Indo-China, on the right bank of the Song-kol or Red river, about 80 m. from its mouth in the Gulf of Tongking. Taking in the suburban population the inhabitants numbered in 1905 about 110,000, including 103,000 Annamese, 2,880 Chinese and 2,665 French, exclusive of troops. Hanoi resembles a European city in the possession of wide-paved streets and promenades, systems of electric light and drainage and a good water-supply. A crowded native quarter built round a picturesque lake lies close to the river with the European quarter to the south of it. The public buildings include the palace of the governor-general, situated in a spacious botanical and zoological garden, the large military hospital, the cathedral of St. Joseph, the Paul Bert college, and the barracks and other military buildings occupy the site of the old citadel, an area of over 500 acres, to the west of the native town. The so-called pagoda of the Great Buddha is the chief native building. The river is embanked and is crossed by the Pont Droumer, a fine railway bridge over 1 km. long. Vessels drawing 8 or 9 ft. can reach the town. Hanoi is

1 For others of the name see Carthage; Hannibal; Punic Wars. Smith’s Classical Dictionary has notices of some thirty of the name.
the seat of the general government of Indo-China, of the resident-superior of Tonking, and of a bishop, who is vicar-apostolic of central Tongking. It is administered by an elective municipal council with a civil service administrator as mayor. It has a chamber of commerce, the president of which has succeeded the succes- sors of the old, and there is an appeals council of the court of appeal of Indo-China, a civil tribunal of the first order, and is the seat of the chamber of agriculture of Tongking. Its industries include cotton-spinning, brewing, distilling, and the manufacture of tobacco, earthenware and matches; native industry produces carved and inlaid furniture, bronzes and artistic metalwork, silk embroidery, &c. Hanoi is the junction of railways to Hai-Phong, its seaport, Lao-Kai, Vinh, and the Chinese frontier via Lang-Son. It is in frequent communication with Hai-Phong by steamer.

HANOI, ALBERT AUGUSTE GABRIEL (1853- ), French statesman and historian, was born at Beaurevoir in the department of Aisne. He received his historical training in the École des Chartes, and became maître de conférences in the École des Hautes Études. His political career was rather that of a civil servant than of a party politician. In 1879 he entered the ministry of foreign affairs as a secretary, and rose step by step through the diplomatic service. In 1886 he was elected deputy for Aisne, but, defeated in 1889, he returned to the ministry of foreign affairs, and was chosen by Charles Dupuy to be minister of foreign affairs. With one interruption (during the Ribot ministry, from the 26th of January to the 2nd of November 1893) he held this portfolio until the 14th of June 1898. During his ministry he developed the rapPROCHE- mENT of France with Russia—visiting St Petersburg with the president, Félix Faure—and sent expeditions to delimit the French colonies in Africa. The Fashoda incident of July 1898 was a result of this policy, and Hanoïtaux’s distrust of England is frankly stated in his literary works. As an historian he published Anciens de France (1855); Etudes sur les XVIe et XVIIe siècles en France (1886); Histoire de Richelieu (2 vols., 1888); and Histoire de la Troisième République (1904, &c.), the standard history of contemporary France. He also edited the Instructions des ambassadeurs de France à Rome, depuis les traités de Westphalie (1888). He was elected a member of the French Academy on the 1st of April 1897.

HANOVER (Ger. Hannover), formerly an independent kingdom of Germany, but since 1866 a province of Prussia. It is bounded on the N. by the North Sea, Holstein, Hamburger, and Schleswig-Holstein; on the E. by Mecklenburg-Schwerin, and S.E. by Prussian Saxony and the duchy of Brunswick, S.W. by the Prussian provinces of Hesse-Nassau and Westphalia, and W. by Holland. These boundaries include the grand-duchy of Oldenburg and the free state of Bremen, the former stretching southward from the North Sea nearly to the southern boundary of Hanover. A small portion of the province in the south is separated from Hanover proper by the interposition of part of Brunswick. On the 23rd of March 1873 the province was increased by the addition of the Jade territory (purchased from Prussia by Oldenburg), lying south-west of the Elbe and containing the great naval arsenal of Wilhelmshaven. The area of the province is 14,870 sq. m.

Physical Features.—The greater part of Hanover is a plain with sandhills, heath and moor. The most fertile districts lie on the banks of the Elbe and near the North Sea, where, as in Holland, rich meadows are preserved from encroachment of the sea by broad dikes and deep ditches, kept in repair at great expense. The main feature of the northern plain is the so-called Lüneburger Heide, a vast expanse of moor and fen, mainly covered with low brushwood (though here and there are cases of fine beech and oak woods) and intersected by shallow valleys, and extending almost due north from the city of Hanover to the southern arm of the Elbe at Harburg. The southern portion of the province is hilly, and in the district of Krummensen, containing the Harz, mountains. The highest elevations are covered by dense forests of fir and larch, and the lower slopes with deciduous trees. The eastern portion of the northern plain gives place to the forest of Hanover, and the western extends to the Zuiderr Zee. Canals are numerous and connect the various rivers.

The principal lakes are the Steinhaar Meer, about 4 m. long and 2 m. in width, and 20 ft. deep, situated on the borders of the river Lippe, the Dümmersee, on the borders of Oldenburg, about 12 m. in circuit; the lakes of Bederkosa and some others in the moorlands of the north; the Seeburger See, near Duderstadt; and the Oder- torf, a lake near the Harz, about 3 sq. m.

Climate.—The climate in the low-lying districts near the coast is moist and foggy, in the plains mild, on the Harz mountains severe and variable. In spring the prevailing winds blow from the N.E. and N.W. in summer from the S.E. In winter the average temperature of Hanover is about 46° Fahr.; in the town of Hanover it is higher. The average annual rainfall is about 25-5 in.; but this varies greatly in different districts. In the west the Harz, a thick fog arising from the burning of the moors, is a plague of frequent occurrence.

Population, Divisions.—The province contains an area of 14,869 sq. m., and the total population, according to the census of 1905, was 2,759,059 (1,384,101 males and 1,375,958 females). In this con- nexion it is noticeable that in Hanover, almost alone among German states and provinces, there is a considerable proportion of male births over female. The density of the population is 175 to the square m., with Hanover (1,964), and the towns of the province, roughly, as 1 to 3 of the inhabitants. The province is divided into the six Registrarhafte (or departments) of Hanover, Hildesheim, Lüneburg, Stade, Osnabrück and Aurich, and these again into towns, rural districts, or local government districts, in all. The chief towns—containing more than 10,000 inhabitants—are Hanover, Lüneburg, Osnabrück, Hildesheim, Geestemünde, Wilhelmshaven, Hildesheim, and Lüneburg, which contain a total population of 192,000. The returns show that 84% of the inhabitants belong to the Evangelical-Lutheran Church, 17 to the Roman Catholic and less than 1% to the Jewish communities. The Roman Catholics are mostly gathered in the diocese of Münster, episcopal see, and the Jewish communities are mainly associated with the municipal council of Münster (in Westphalia) on the western border, and the Jews in the east. A court of appeal for the whole province sits at Celle, and there are eight superior courts. Hanover returns 19 members to the Reichstag (or Imperial Diet) in the Hamburger Hofgarten (lower house) of the Prussian parliament (Landtag). Education.—Among the educational institutions of the province the university of Göttingen stands first, with an average yearly attendance of 1,500 students. There are, besides, a technical college in Hanover, an academy of forestry in Münster, a mining college in Clausthal, a military school and a veterinary college (both in Hanover), 26 gymnasia (classical schools), 18 semi-classical, and 14 co-educational. There are also two theological seminaries for the deaf and dumb, and numerous charitable institutions.

Agriculture.—Though agriculture constitutes the most important branch of industry, Hanover is not a land rich in the soil of the state. The greater part of the soil is of inferior quality, and much that is cultivated is still lying waste. Of the entire area of the country 28-5% is arable, 16-2 in meadow or pasture land, 32-9% woods, 37-1% waste land, and 17 to 18% is possession of the state. The best agriculture is to be found in the districts of Hildesheim, Calenberg, Göttingen and Hannover, on the banks of the Elbe, and in the district of Friesland. Rye is generally grown for bread. Flax, for which much of the soil is admirably adapted, is extensively cultivated, and forms an important article of export, chiefly, however, in the form of yarn. Potatoes, hemp, turnips, hops, tobacco and beet are also extensively grown, the latter, in connexion with the sugar industry, showing each year a larger return. Apples, pears, plums and cherries are the principal kinds of fruit cultivated, while the wild fruits towards Harz, and the berries from the marshes of the Lüneburger Heide form an important article of export.

Livestock.—Hanover is renowned for its cattle and live stock generally. About 600,000 head of these consist of 12,000 head of horned cattle, 824,000 sheep, 1,555,000 pigs, and 230,000 goats. The Lüneburger Heide yields an excellent breed of sheep, the Heidenschweine, which equal the Southdowns of England in delicacy of flavour. Horses famous for their size and quality are reared in the marshes of Aurich and Stade, in Hildesheim and Hanover; and, for breeding purposes, in the stud farm of Celle. Bees are principally kept in the marshes of Harz, and the honey obtained from them is of considerable. Large flocks of geese are kept in the moist lowlands; their flesh is salted for domestic consumption during the winter, and their feathers are prepared for sale. The rivers yield trout, salmon and eels, and the numerous inland fisheries are important and have their chief centre at Geestemünde.

Mining.—Minerals occur in great variety and abundance. The Harz Mountains are rich in silver, lead, iron and copper; coal is found about Onnen, on the Helgoland, at Ottowald, and in various places; salt-springs of great richness exist at Egertalshaff
and Neuball near Hanover, and at Lüneburg; and petroleum may be obtained south of Celle. In the cold regions of the northern lowlands peat occurs in beds of immense thickness.

Manufactures.—Works for the manufacture of iron, copper, silver, china, and glass are carried on to a great extent. The iron works are very important; smelting is carried on in the Harz and near Osnabrück; there are extensive foundries and machine factories at Hanover, Linden, Osnabrück, Göttingen, and Hameln; and small foundries and machine shops are scattered throughout the towns. In Osnabrück and Hildesheim, and being cleaned in extensively woollen cloths are made to a considerable extent in the south about Einbeck, Göttingen and Hameln; and also weaving and dyeing and finishing of them have their principal seats at Hanover and Linden. Glass houses, paper-mills, pottery, tile works and tobacco-pipe works are numerous. Wax is bleached to a considerable extent, and there are numerous glass manufactories, tanneries, dye works, and brandy distilleries. Shipbuilding is an important industry, especially at Wilhelmshaven, Papenburg, Leer, Stade and Harburg; and at Münden river-barges are built.

Commerce.—Although the carrying trade of Hanover is to a great extent absorbed by Hamburg and Bremen, the shipping of the province counted, in 1903, 750 sailing vessels and 86 steamers of together, 55,498 registered tons. The natural port is Bremen-Cede, and to it is directed the river traffic down the Weser, which practically forms the chief commercial artery of the province.

Communications.—The roads throughout are, on the whole, well laid out, and the portion mentioned in the paragraph above. Hanover is intersected by important trunk lines of railway: notably the lines from Berlin to Cologne, from Hamburg to Frankfort-on-Main, from Hamburg to Bremen and Cologne, and from Berlin to Amsterdam.

History.—The name Hanover (Hohensax = high bank), originally confined to the town which became the capital of the duchy of Lüneburg-Calenberg, came gradually into use to designate, first, the duchy itself, and secondly, the electorate of Brunswick-Lüneburg; and it was officially recognized as the name of the state when in 1814 the electorate was raised to the rank of a kingdom.

The early history of Hanover is merged in that of the duchy of Brunswick (q.v.), from which the duchy of Brunswick-Lüneburg and its offshoots, the duchies of Lüneburg-Celle and Lüneburg-Calenberg have sprung. Ernest I. (1407-1456), duke of Brunswick-Lüneburg, who introduced the reformed doctrines into Lüneburg, obtained the whole of this duchy in 1539; and in 1569 his two surviving sons made an arrangement which was afterwards responsible for the birth of the kingdom of Hanover. By this agreement the greater part of the duchy, with its capital at Celle, came to William (1535-1592), the younger of the brothers, who gave laws to his land and added to its area; and this duchy of Lüneburg-Celle was subsequently ruled in turn by four of his sons: Ernest II. (1564-1611), Christian (1566-1633), Augustus (d. 1636) and Frederick (d. 1648). In 1539 Duke Ludwig of Brunswick-Lüneburg and the three other sons, and in 1610 the seven brothers entered into a compact that the duchy should not be divided, and that only one of them should marry and continue the family. Casting lots to determine this question, the lot fell upon the sixth brother, George (1582-1641), who was a prominent soldier during the period of the Thirty Years' War and saw service in almost all parts of Europe, fighting successively for Christian IV. of Denmark, the emperor Ferdinand II., and for the Swedes both before and after the death of Gustavus Adolphus. In 1617 he aided his brother, Duke Christian, to add Gruhenhagen to Lüneburg, and after the extinction of the family of Brunswick-Wolfenbüttel in 1634, he obtained Calenberg for himself, making Hanover the capital of his small dukedom. In 1648, on Duke Frederick's death, George's eldest son, Christian Louis (d. 1665), became duke of Lüneburg-Celle; and at this time he handed over Calenberg, which he had ruled since his father's death, to his second brother, George William (d. 1705). When Christian Louis died George William succeeded him in Lüneburg-Celle; but the duchy was also claimed by a younger brother, John Frederick, a cultured and enlightened prince who had forsaken the Roman faith of his family and had become a Roman Catholic. Soon, however, by arrangement John Frederick received Calenberg and Gruhenhagen, which he ruled in absolute fashion, creating a standing army and modelling his court after that of Louis XIV., and which came on his death in 1679 to his youngest brother, Ernest Augustus (1650-1688), the Protestant bishop of Osnabrück. During the French wars of aggression the Lüneburg princes were eagerly courted by Louis XIV. and by his opponents; and after some hesitation George William, influenced by Ernest Augustus, fought among the Imperialists, while John Frederick was ranged on the side of France. In 1679 George William was one of the claimants for the dukedom of Saxe-Lauenburg, which was left without a ruler in that year; and after a struggle with John George III., elector of Saxony, and other rivals, he was invested with the duchy by the emperor Leopold I. It was, however, his more ambitious brother, Ernest Augustus, who did most for the prestige and advancement of the house. Having introduced the 'principle of primogeniture into Calenberg in 1682, Ernest determined to secure for himself the position of an elector, and the condition of Europe and the exigencies of the emperor favoured his pretensions. He made skilful use of Leopold's difficulties; and in 1692, in return for lavish promises of assistance to the Empire and the Habsburgs, the emperor granted him the rank and title of elector of Brunswick-Lüneburg with the office of standard-bearer in the Holy Roman Empire. Indignant protests followed this proceeding. A league was formed to prevent any addition to the electoral college; France and Sweden were called upon for assistance; and the constitution of the Empire was reduced to a state of chaos. This agitation, however, soon died away; and in 1708 George Louis, the son, and successor of Ernest Augustus, was recognized as an elector of Saxony. George Louis married his cousin Sophia Dorothea, the only child of George William of Lüneburg-Celle; and on his uncle's death in 1705 he united this duchy, together with Saxe-Lauenburg, with his paternal inheritance of Calenberg or Hanover. His father, Ernest Augustus, had taken a step of great importance in the history of Hanover when he married Sophia, daughter of the elector palatine, Frederick V., and grand-daughter of James I. of England, for, through his mother, the elector George Louis became, by the terms of the Act of Settlement of 1701, king of Great Britain and Ireland in 1714.

From this time until the death of William IV. in 1837, Lüneburg or Hanover, was ruled by the same sovereign as Great Britain, and this personal union was not without important results for both countries. Under George I. Hanover joined the alliance against Charles XII. of Sweden in 1715; and by the peace of Stockholm in November 1719 the elector received the duchies of Bremen and Verden, which formed an important addition to the electorate. His son and successor, George II., who founded the university of Göttingen in 1737, was on bad terms with his brother-in-law Frederick William I. of Prussia, and his nephew Frederick the Great; and in 1720 war between Prussia and Hanover was only just avoided. In 1743 George took up arms on behalf of the empress Maria Theresa; but in August 1745 the danger in England from the Jacobites led him to sign the convention of Hanover with Frederick the Great, although the struggle with France raged around his electorate until the peace of Aix-la-Chapelle in 1748. Induced by political exigencies George allied himself with Frederick the Great when the Seven Years' War broke out in 1756; but in September 1757 his son William Augustus, duke of Cumberland, was compelled after his defeat at Hastenbeck to sign the convention of Klosterzeven and to abandon Hanover to the French. English money, however, came to the rescue; in 1758 Frederick, duke of Brunswick, cleared the electorate of the invader; and Hanover suffered no loss of territory at the peace of 1763. Both George I. and George II. preferred Hanover to England as a place of residence, and it was a frequent and perhaps justifiable cause of complaint that the interests of Great Britain were sacrificed to those of the smaller country. But George III. was more British than either his grandfather or his great-grandfather, and owing to a variety of causes the foreign policy of the two countries began to diverge in the later years of his reign. Two
main considerations dominated the fortunes of Hanover during the period of the Napoleonic wars, the jealousy felt by Prussia at the increasing strength and prestige of the electorate, and its position as a vulnerable outpost of Great Britain. From 1813 the Hanoverian troops fought for the Allies against France, until the treaty of Basel between France and Prussia in 1815 imposed a forced neutrality upon Hanover. At the instigation of Bonaparte Hanover was occupied by the Prussians for a few months in 1801, but at the settlement which followed the peace of Lunéville the secularized bishopric of Osnabrück was added to the electorate. Again tempting the fortune of war after the rupture of the peace of Amiens, the Hanoverians found that the odds against them were too great; and in June 1803 by the convention of Sulingen their territory was occupied by the French. The formation of the third coalition against France in 1805 induced Napoleon to purchase the support of Prussia by allowing her troops to seize Hanover; but in 1807, after the defeat of Prussia at Jena, he incorporated the southern part of the electorate in the kingdom of Westphalia, adding the northern portion to France in 1810. The French occupation was costly and aggressive; and the Hanoverians, many of whom were found in the allied armies, welcomed the fall of Napoleon and the return of the old order. Represented at the congress of Vienna by Ernest, Count Münster, the elector was granted the title of Duke of Brunswick and the hereditary dignity of Statthalter, and he further recovered the estates in Hildesheim, the city of Goslar, and some smaller additions of territory, in return for the surrender of the greater part of the duchy of Saxe-Lauenburg to Prussia.

Like those of the other districts of Germany, the estates of the different provinces which formed the kingdom of Hanover had met for many years in an irregular fashion to exercise their varying and ill-defined powers, but, although in 1813 the new King Augustus introduced a system of administrative councils into Celle, these estates, consisting of the three orders of prelates, nobles and towns, together with a body somewhat resembling the English privy council, were the only constitution which the country possessed, and the only check upon the power of its ruler. When the elector George Louis became king of Great Britain in 1744 he appointed a representative, or Statthalter, to govern the electorate, and thus the union of the two countries was attended with constitutional changes in Hanover as well as in Great Britain. Responsibility of course was transferred to the Statthalter, aided by the privy council, conducted the internal affairs of the electorate, generally in a peaceable and satisfactory fashion, until the death of the Napoleonic wars. On the conclusion of peace in 1814 the estates of the several provinces of the kingdom were fused into one body, consisting of eighty-five members, but the chief power was exercised as before by the members of a few noble families. In 1819, however, this feudal relic was supplanted by a new constitution. Two chambers were established, the one formed of nobles and the other of elected representatives; but although they were authorized to control the finances, their power with regard to legislation was very circumscribed. This constitution was sanctioned by the prince regent, afterwards King George IV.; but it was out of harmony with the new and liberal ideas which prevailed in Europe, and it hardly survived George's decease in 1830. The revolution of that year compelled George's brother and successor, William, to dismiss Count Münster, who had been the actual ruler of the country, and to name his own brother, Adolphus Frederick, duke of Cambridge, a viceroy of Hanover; one of the viceroy's earliest duties being to appoint a commission to draw up a new constitution. This was done, and after William had insisted upon certain alterations, it was accepted and promulgated in 1833. Representation was granted to the peasants; the two chambers were empowered to initiate legislation; ministers were made responsible for all acts of government; a civil list was given to the king in return for the surrender of the crown lands; and, in short, the new constitution was similar to that of Great Britain. These liberal arrangements, however, did not entirely allay the discontent. A strong and energetic party endeavoured to thwart the working of the new order, and matters came to a climax when William was dethroned.

By the law of Hanover a woman could not ascend the throne, and accordingly Ernest Augustus, duke of Cumberland, the fifth son of George III., and not Victoria, succeeded William as sovereign in 1837, thus separating the crowns of Great Britain and Hanover after a union of 123 years. Ernest, a prince with very autocratic ideas, had disapproved of the constitution of 1833, and his first important act as king was to declare it invalid. He appears to have been especially chagrined because the crown lands were not his personal property, but the whole of the new house of Hanover. Seven Göttingen professors who protested against this proceeding were deprived of their chairs; and some of them, including F. C. Dahlmann and Jakob Grimm, were banished from the country for publishing their protest. To save the constitution an appeal was made to the German Confederation, which Hanover had joined in 1875; but the federal diet declined to interfere, and in 1840 Ernest altered the constitution to suit his own illiberal views. Recovering the crown lands, he abolished the principle of ministerial responsibility, the legislative power of the two chambers, and other reforms, virtually restoring affairs to their condition before 1815. The new constitution lasted, with few alterations, until 1848, when the king probably saved his crown by hastily giving back the constitution of 1833. Order, however, having been restored, in 1850 he dismissed the Liberal ministry and attempted to evade his concessions; a bitter struggle had just broken out when Ernest Augustus died in November 1851. During this reign the foreign policy of Hanover both within and without Germany had been coloured by jealousy of Prussia and by the king's autocratic ideas. Refusing to join the Prussian Zollverein, Hanover had become a member of the rival commercial union, the Solleverein, and had thereby strengthened the position of the Confederation of the Rhine. The king thus endeavored to maintain his political independence, and, when it was threatened, to keep his connection with the Confederation. He therefore followed the course of Germany, and in 1866 the king protested against the Prussian invasion of Saxony and the establishment of a German confederation without Hanover. The result was a declaration of war on 14th of June, 1866, in which the Hanoverians were the first to be defeated.

George V., the new king of Hanover, who was unfortunately blind, sharing his father's political ideas, at once appointed as minister those who had advised Ernest to make an alliance with Hannover. The project, however, was resisted by the second chamber of the Landtag, or parliament; and after several changes of government a new ministry advised the king in 1855 to appeal to the diet of the German Confederation. This was done, and the diet declared the constitution of 1848 to be invalid. Acting on this verdict, not only was a ministry formed to restore the constitution of 1849, but after some trouble a body of members fully in sympathy with this object was returned to parliament in 1857. But these members were so far from representing the opinions of the people that popular resentment compelled George to dismiss his advisers in 1862. But the new liberal government which succeeded did not enjoy his complete confidence, and in 1865 a ministry was once more formed which was more in accord with his own ideas. This contest soon lost both interest and importance owing to the condition of affairs in Germany. Bismarck, the director of the policy of Prussia, was devising methods for the realization of his schemes, and it became clear after the war over the duchies of Schleswig and Holstein that the smaller German states would soon be obliged to decide definitely between Austria and Prussia. After a period of vacillation Hanover threw in her lot with Austria, the decisive step being taken when the question of the mobilization of the federal army was voted upon in the diet on the 14th of June 1866. At once Prussia requested Hanover to remain unarmed and neutral during the war, and with equal promptness King George refused to assent to these demands. Prussian troops then crossed his frontier and took possession of his capital.
The Hanoverians, however, were victorious at the battle of Langensalza on the 27th of June 1866, but the advance of fresh bodies of the enemy compelled them to capitulate two days later. By the terms of this surrender the king was not to reside in Hanover, his officers were to take no further part in the war, and his ammunition and stores became the property of Prussia. The decree of the 20th of September 1866 formally annexed Hanover to Prussia, when it became a province of that kingdom, while King George from his retreat at Hietzing appealed in vain to the powers of Europe. Many of the Hanoverians remained loyal to their sovereign; some of them serving in the Guelph Legion, which was maintained largely at his expense in Hanover and Augsburg, while La Situation, was founded by Oskar Medling (1829-1903) and conducted in his interests. These and other elaborate efforts, however, failed to bring about the return of the king to Hanover, though the Guelph party continued to agitate and to hope even after the Franco-German War had immensely increased the power and the prestige of Prussia. George died in June 1878. His son, Ernest Augustus, duke of Cumberland, continued to maintain his claim to the crown of Hanover, and refused to be reconciled with Prussia. Owing to this attitude the imperial government refused to allow him to take possession of the duchy of Brunswick, which he inherited on the extinction of the elder branch of his family in 1884, and again in 1906 when the same subject came up for settlement on the death of the regent, Prince Albert of Prussia.

In 1867 King George had agreed to accept Prussian bonds to the value of about £1,600,000 as compensation for the confiscation of his estates in Hanover. In 1868, however, on account of his continued hostility to Prussia, the Prussian government sequestrated this property; and, known as the Welfensfonds, or Kurfürstensfonds, it was employed as a secret service fund to combat the intrigues of the Guelphs in various parts of Europe; until in 1892 it was arranged that the interest should be paid to the duke of Cumberland. In 1885 measures were taken to incorporate the province of Hanover more thoroughly in the kingdom of Prussia, and there is little doubt but that the great majority of the Hanoverians have submitted to the inevitable, and are loyal subjects of the king of Prussia.

Jahrhunderts, 3 vols. (Leipzig, 1833-1836). M. Bär, Übersicht über die Bestände des königlichen Staatsarchiv zu Hannover (Leipzig, 1905); Hannoversches Portfolio (Stuttgart, 1839-1841); and the authorities given for the history of Brunswick.

HANOVER, the capital of the Prussian province of the same name, situated in a sandy but fertile plain on the Leine, which here receives the Ihme, 38 m. N.W. from Brunswick, 78 S.E. of Bremen, and at the crossing of the main lines of railway, Berlin to Cologne and Hamburg to Frankfort-on-Main. Pop. (1885) 139,731; (1900) 235,666; (1905) 250,032. On the north and east the town is half encircled by the beautiful woods and groves of the Eilenriede and the List which form the public park. The Leine flows through the city, having the old town on its right and the quaint Calenberger quarter between its left bank and the Ihme. The old town is irregularly built, with narrow streets and old-fashioned gabled houses. In its centre lies the Markt Kirche, a red-brick edifice of the 14th century, containing interesting monuments and some fine stained-glass windows, and with a steeple 310 ft. in height (the highest in Hanover). Its interior was restored in 1855. Close by, on the market square, is the red-brick medieval town-hall (Rathaus), with an historical wine cellar beneath. It has been superseded for municipal business by a new building, and now contains the civic archives and museum. The new town, surrounding the old on the north and east, and lying between it and the woods referred to, has wide streets, handsome buildings and beautiful squares. Among the last-mentioned are the square at the railway station—the Ernst August-Platz—with an equestrian statue of King Ernest Augustus in bronze; the triangular Theater-Platz, with statues of the composer Marschner and others; and the Georgs-Platz, with a statue of Schiller. To the south of the old town, on the banks of the Ihme, lies the Waterloo-Platz, with a column of victory, 154 ft. high, having inscribed on it the names of 800 Hanoverians who fell at Waterloo. In the adjacent gardens an open rotunda encloses a marble bust of the philosopher Leibnitz, and near it is a monument to General Count von Alten, commander of the Hanoverian troops at Waterloo. Among the other churches the most noticeable are the Neustädterkirche, with a graceful shrine containing the tomb of Leibnitz, the Kreuzkirche, built about 1300, with a curious steeple, and the Aegidienkirche among ancient edifices, and among modern ones the Christuskirche, a gift of King George V., the Lukaskirche, the Lutherkirche, and the Roman Catholic church of St Mary, with a tower 300 ft. high, containing the grave of Ludwig Windthorst, “his little excellency,” for many years leader of the united Protestant forces of the Empire.

Hanover has a number of colleges and schools, and is the seat of several learned societies. It is largely frequented by foreign students, especially English, attracted by the educational facilities it offers and by the reputed purity of the German spoken. Hanover is the headquarters of the X. Prussian army corps, has a large garrison of nearly all arms and a famous military riding school. It occupies a leading position among the industrial and commercial towns of the empire, and of recent years has made rapid progress in prosperity. It is connected by railway with Berlin, Hamburg, Bremen, Hameln, Cologne, Altenbeken and Cassel, and the facilities of intercourse have, under the fostering care of the Prussian government, enormously developed its trade and manufactures. Almost all industries are represented; chief among them are machine-building, the manufacture of India-rubber, linen, cloth, hardware, chemicals, tobacco, pianos, furniture and groceries. The commerce consists principally in wine, hides, horses, coal, wood and cereals. There are extensive printing establishments. Hanover was the first German town that was lighted with gas. It is the birthplace of Sir William Herschel, the astronomer, of the brothers Schlegel, of Ifland and of the historian Pertz. The philosopher Leibnitz died there in 1716.

HANOVER—HANSARD

of the Welfs, now dukes of Brunswick. It joined the Hanseatic League, and was later the residence of the branch of the ducal house, which received the title of elector of Hanover and ascended the British throne in the person of George I. One or two important treaties were signed in Hanover, which from 1810 to 1813 was part of the kingdom of Westphalia, and in 1866 was annexed by Prussia, after having been the capital of the kingdom of Hanover since its foundation in 1815.

HANOVER, a town of Jefferson county, Indiana, U.S.A., on the Ohio river, about 5 m. below Madison. Pop. (1900) 377; (1910) 356. It is served by boats on the Ohio river, and by stages to Madison, the nearest railway station. Along the border of the town and on a bluff rising about 500 ft. above the river is Hanover College, an institution under Presbyterian control, embracing a college and a preparatory department, and offering classical and scientific courses and instruction in music; there is no charge for tuition. In 1908-1909 there were 211 students, 75 being in the Academy. The institution was opened in a log cabin in 1827, was incorporated as Hanover Academy in 1828, was adopted as a synodical school by the Presbyterian Synod of Indiana in 1829 on condition that a Theological department be added, and in 1833 was incorporated under its present name. In 1840, however, the theological department became a separate institution and was removed to New Albany, whence in 1859 it was removed to Chicago, where it was named, first, the Presbyterian Theological Seminary of the North-west, and, in 1886, the McCormick Theological Seminary. In the years immediately after its incorporation in 1833 Hanover College introduced the "manual labor system" and was for a time very prosperous, but the system was not a success, the college ran into debt, and in 1843 the trustees attempted to surrender the charter and to acquire the charter of a university at Madison. This effort was opposed by a strong party, which secured a more liberal charter for the college. In 1880 the college became coeducational.

HANOVER, a township of Grafton county, New Hampshire, U.S.A., on the Connecticut river, 75 m. by rail N.W. of Concord. Pop. (1900) 1884; (1910) 2975. No railway enters this township; the Ledyard Free Bridge (the first free bridge across the Connecticut) connects it with Norwich, Vt., which is served by the Boston & Maine railway. Ranges of rugged hills, broken by deep narrow gorges and by the wider valley of Mink Brook, rise near the river and culminate in the E. section in Moose Mountain, 3236 ft. above the sea. Near the foot of Moose Mountain is the birthplace of Laura D. Bridgman. Agriculture, dairying and lumbering are the chief pursuits of the inhabitants. The village of Hanover, the principal settlement of the township, occupies Hanover Plain in the S.W. corner, and is the seat of Dartmouth College (q.v.), which has a strikingly beautiful campus, and among its buildings several excellent examples of the colonial style, notably Dartmouth Hall. The Mary Hitchcock memorial hospital, a cottage hospital of 56 beds, was erected in 1800-1803 by Hiram Hitchcock in memory of his wife. The charter of the township was granted by Gov. Benning Wentworth on the 4th of July 1761, and the first settlement was made in May 1765. The records of the town meetings and selectmen, 1761-1818, have been published by E. P. Storr (Hanover, 1905).

See Frederick Chase, A History of Dartmouth College and the Town of Hanover (Cambridge, 1897).

HANOVER, a city of York county, Pennsylvania, U.S.A. 36 m. S. by W. of Harrisburg, and 6 m. from the S. border of the state. Pop. (1890) 3746; (1900) 5302, (133 foreign-born); (1910) 7057. It is served by the Northern Central and the Western Maryland railways. The borough is built on nearly level ground in the fertile valley of the Conewago, at the point of intersection of the turnpike roads leading to Baltimore, Carlisle, York and Frederick, from which places the principal streets—sections of these roads—are named. Among its manufactures are foundry and machine-shop products, flour, silk, waggons, shoes, gloves, furniture, wire cloth and cigars. The settlement of the place was begun mostly by Germans during the middle of the 18th century. Hanover was laid out in 1753 or 1764 by Col. Richard MacAllister; and in 1815 it was incorporated. On the 30th of June 1863 there was a cavalry engagement in and near Hanover between the forces of Generals H. J. Kilpatrick (Union) and J. E. B. Stuart (Confederate) preliminary to the battle of Gettysburg. This engagement is commemorated by an equestrian statue erected in Hanover by the state.

HANRIO, FRANÇOIS (1701-1704), French revolutionist, was born at Nanterre (Seine) of poor parentage. Having lost his first employment—with a procureur—through dishonesty, he obtained a clerkship in the Paris office in 1789, but was dismissed for abandoning his post when the Parisians burned the octroi barriers on the night of the 12th-13th of July 1789. After leading a hand-to-mouth existence for some time, he became one of the orators of the section of the sans-culottes, and commanded the armed force of that section during the insurrection on the 10th of August 1792 and the massacres of September. But he did not come to prominence until the night of the 30th-31st of May 1793, when he was provisionally appointed commandant-general of the armed forces of Paris by the council general of the commune. On the 3rd May he was one of the delegates from the Commune to the Convention demanding the dissolution of the Commission of Twelve and the proscription of the Girondists (q.v.), and he was in command of the insurrectionary forces of the Commune during the èmeute of the 2nd of June (see FRENCH REVOLUTION). On the 11th of June he resigned his command, declaring that order had been restored. On the 13th he was impeached in the Convention; but the motion was not carried, and on the 1st of July he was elected by the Commune permanent commander of the armed forces of Paris. This position, which gave him enormous power, he retained until the revolution of the 9th Thermidor (July 27, 1794). His arrest was decreed; but he had the générale sounded and the tocsin rung, and tried to rescue Robespierre, who was under arrest in the hall of the Comité de Sûreté Générale. Hanriot was himself arrested, but was rescued by his adherents, and hastened to the Hôtel de Ville. After a vain attempt to organize resistance he fled and hid in a secluded yard, where he was discovered the next day. He was arrested, sentenced to death, and guillotined with Robespierre and his friends on the 10th Thermidor of the year II (the 28th of July 1794).

HANSARD, LUKE (1738-1818), English printer, was born on the 5th of July 1752 in St Mary's parish, Norwich. He was educated at Boston grammar school, and was apprenticed to Stephen White, a Norwich printer. As soon as his apprenticeship had expired Hansard started for London with only a guinea in his pocket, and became a compositor in the office of John Hughes (1763-1771), printer to the House of Commons. In 1774 he was made a partner, and undertook almost the entire conduct of the business, which in 1800 came completely into his hands. On the admission of his sons the firm became Luke Hansard & Sons. Among those whose friendship Hansard won in the exercise of his profession were Robert Orme, Burke and Dr Johnson; while Forson praised him as the most accurate printer of Greek. He printed the Journals of the House of Commons from 1774 till his death. The promptitude and accuracy with which Hansard printed parliamentary papers were often of the greatest service to government—notably on one occasion when the proofsheets of the report of the Secret Committee on the French Revolution were submitted to Pitt twenty-four hours after the draft had left his hands. On the union with Ireland in 1801, the increase of parliamentary business compelled Hansard to give up all private printing except that of Maclise Hansard to sitting. He devised numerous expedients for reducing the expense of publishing the reports; and in 1805, when his workmen struck at a time
of great pressure, he and his sons themselves set to work as compositors. Luke Hansard died on the 29th of October 1828.

His son, THOMAS CURSON HANSARD (1776–1833), established a press of his own in Paternoster Row, and began in 1803 to print the Parliamentary Debates, which were not at first independent reports, but were taken from the newspapers. After 1889 the debates were published by the Hansard Publishing Union Limited. T. C. Hansard was the author of Typographia, an Historical Sketch of the Origin and Progress of the Art of Printing (1825). The original business remained in the hands of his younger brothers, James and Luke Graves Hansard (1777–1852). The firm was prosecuted in 1837 by John Joseph Stockwell for printing by order of the House of Commons, in an official capacity, a pamphlet which it was alleged was libellous. Hansard shielded himself on the ground of privilege, but it was not until after much litigation that the security of the printers of government reports was guaranteed by statute in 1840.

**HANSEATIC LEAGUE.** It is impossible to assign any precise date for the beginning of the Hanseatic League or to name any single factor which explains the origin of that loose but effective federation of North German towns. Associated action of individual towns in Flanders and elsewhere can be traced back to the 13th century. In 1241 we find Lübeck and Hamburg agreeing to safeguard the important road connecting the Baltic and the North Sea. The first known meeting of the “maritime towns,” later known as the Wendish group and including Lübeck, Hamburg, Lüneburg, Wismar, Rostock and Stralsund, took place in 1256. The Saxon towns, during the following century, were joining to protect their common interests, and indeed at this period town confederacies in Germany, both North and South, were so considerable as to call for the declaration against them in the Golden Bull of 1356. The decline of the imperial power and the growing opposition between the towns and the territorial princes justified these defensive town alliances, which in South Germany took on a peculiarly political character. The relative weakness of territorial power in the North, after the fall of Henry the Lion of Saxony, diminished without however removing this motive for union, but the comparative immunity from princely aggression on land left the towns freer to combine in a stronger and more permanent union for the defence of their commerce by sea and for the control of the Baltic.

While the political element in the development of the Hanseatic League must not be underestimated, it was not so formative as the economic. The foundation was laid for the growth of German towns along the southern shore of the Baltic by the great movement of German colonization of Slavic territory east of the Elbe. This movement, extending in time from about the middle of the 11th to the middle of the 13th century and carrying a stream of settlers and traders from the Northwest, resulted not only in the Germanization of a wide territory but in the extension of German influence along the sea-coast far to the east of actual territorial settlement. The German trading towns, at the mouths of the numerous streams which drain the North European plain, were stimulated or created by the unifying impulse of a common and long-continued advance of conquest and colonization.

The impetus of this remarkable movement of expansion not only carried German trade to the East and North within the Baltic basin, but reanimated the older trade from the lower Rhine region to Flanders and England in the West. Cologne and the Westphalian towns, the most important of which were Dortmund, Soest and Münster, had long controlled this commerce but now began to feel the competition of the active traders of the Baltic, opening up that direct communication by sea from the Baltic to western Europe which became the essential feature in the history of the League. The necessity of seeking protection from the searovers and pirates who infested these waters during the whole period of Hanseatic supremacy, the legal customs, substantially alike in the towns of North Germany, which governed the groups of traders in the outlying trading posts, the establishment of common factories, or “counters” (Komtore) at these points, with aldermen to administer justice and to secure trading privileges for the community of German merchants—such were some of the unifying influences which preceded the gradual formation of the League. In the century of energetic commercial development before 1350 the German merchants abroad led the way.

Germans were early pushing as permanent settlers into the Scandinavian towns, and in Wisby, on the island of Gothland, the Scandinavian centre of Baltic trade, equal rights as citizens in the town government were possessed by the German settlers as early as the beginning of the 13th century. There also came into existence at Wisby the first association of German traders abroad, and in 1254 the Lübecker and Hamburg, having thirty towns, from Cologne and Utrecht in the West to Reval in the East. We find the Gotland association making in 1299 a treaty with a Russian prince and securing privileges for their branch trading station at Novgorod. According to the “Skr,” the by-laws of the Novgorod branch, the four aldermen of the community of Germans, who among other duties held the keys of the common chest, deposited in Wisby, were to be chosen from the merchants of the Gotland association and of the towns of Lübeck, Soest and Dortmund. The Gotland association received in 1257 privileges for their community of thirty towns, and in 1299 at Berlin the Gotland and Wendish merchants were confirmed in the privileges of a charter in Flanders. It legislated on matters relating to common trade interests, and, in the case of the regulation of 1287 concerning shipwrecked goods, we find it imposing this legislation on the towns under the penalty of exclusion from the association. But with the extension of the East and West trade beyond the confines of the Baltic, this association by the end of the century was losing its position of leadership. Its inheritance passed to the gradually forming union of towns, chiefly those known as Wendish, which looked to the Lübecker and Wendish merchants, but which, as we have seen, a few years later the Wendish and Westphalian towns, meeting at Lübeck, ordered that the Gotland association should no longer use a common seal. Though Lübeck’s right as court of appeal from the Hanseatic counter at Novgorod was not recognized by the general assembly of the League until 1373, the long-existing practice had simply accorded with the actual shifting of commercial power. The union of merchants abroad was beginning to come under the control of the partial union of towns at home.

A similar and contemporary extension of the influence of the Baltic traders under Lübeck’s leadership may be witnessed in the West. As a consequence of the close commercial relations early existing between England and the Rhenish-Westphalian towns, the merchants of Cologne were the first to possess a gild-hall in London and to form a “hansa” with the right of admitting other German merchants on payment of a fee. The charter of 1226, however, by which Emperor Frederick II. created Lübeck a free imperial city, expressly declared that Lübeck citizens trading in England should be free from the dues imposed by the merchants of Cologne and should enjoy equal rights and privileges. In 1366 and 1367 the merchants of Hamburg and Lübeck received from Henry III. the right to establish their own hansas in London, like that of Cologne. The situation thus created led by 1282 to the coalescence of the rival associations in the “Gild-hall of the Germans,” but though the Baltic traders had secured a recognized foothold in the enlarged and unified organization, Cologne retained the controlling interest in the London settlement until 1472. Lübeck and Hamburg, however, dominated the German trade in the ports of the east coast, notably in Lynn and Boston, while they were strong in the organized trading settlements at York, Hull, Ipswich, Norwich, Yarmouth and Bristol. The counter at London, first called the Steelyard in a parliamentary petition of 1422, claimed jurisdiction over the other factories in England.

In Flanders, also, the German merchants from the West had long been trading, but here it had later to endure not only the rivalry but the pre-eminence of those from the East. In 1352 the first treaty privileges for German trade in Flanders show
two men of Lübeck and Hamburg heading the "Merchants of the Roman Empire," and in the later organization, the counter at Bruges four or five of the six aldermen were chosen from towns east of the Elbe, with Lübeck steadily predominant. The Germans recognized the staple rights of Bruges for a number of commodities, such as wool, wax, furs, copper and grain, and in return for this material contribution to the growing commercial importance of the town, they received in 1309 freedom from the compulsory brokerage which Bruges imposed on foreign merchants. The importance and independence of the German trading settlements abroad was exemplified in the statutes of the Company of German merchants at Bruges, drawn up in 1343 and repeated in their privileges, the grouping of towns in three sections (the "Drittel"), the Wendish-Saxon, the Prussian-Westphalian, and those of Gotland and Livland. Even more important than the assistance which the concentration of the German trade at Bruges gave to that leading mart of European commerce was the service rendered by the German counter of Bruges to the cause of Hanseatic unity. Not merely because of its central commercial position, but because of its width of view, its political insight, and its constant insistence on the necessity of uniting this counter played a leading part in Hanseatic organization. It was the Hanseatic League.

The last of the chief trading settlements, both in importance and in date of organization, was that at Bergen in Norway, where in 1343 the Hanseatics obtained special trade privileges. Scandinavia had early been sought for its copper and iron, its forest products and its valuable fisheries, especially at Schonen, but it was backward in its industrial development and its own commerce had seriously declined in the 14th century. It had come to depend largely upon the Germans for the importation of all its luxuries and of many of its necessaries, as well as for the exportation of its products, but regular trade with the three kingdoms was confined for the most part to the Wendish towns, with Lübeck steadily asserting an exclusive ascendancy. The fishing centre at Schonen was important as a market, though, like Novgorod, its trade was seasonal, but it did not acquire the position of a regularly organized counter, reserved alone, in the North, for Bergen. The commercial relations with the North cannot be regarded as an important element in the union of the Hanse towns, but the geographical position of the Scandinavian countries, especially that of Denmark, commanding the Sound which gave access to the Baltic, enabled a combination of Scandinavian politics on the part of Lübeck and the League and thus by necessitating combined political action in defence of Hanseatic sea-power exercised a unifying influence.

Energetic and successful though the scattered trading settlements had been in establishing German trade connexions and in securing valuable trade privileges, the middle of the 14th century found them powerless to meet difficulties arising from internal dissension and still more from the political rivalries and trade jealousies of nascent nationalities. Flanders became a battle-field in the great struggle between France and England, and the war of trade prohibitions led to infractions of the German privileges in Bruges. An embargo on trade with Flanders, voted in 1358 by a general assembly, resulted by 1360 in the full restoration of German privileges in Flanders, but reduced the counter at Bruges to an executive organ of a united town policy. It is worth noting that in a document connected with this action the union of towns, borrowing the term from English usage, was first called the "German Hansa." In 1361 representatives from Lübeck and Wisby visited Novgorod to recodify the by-laws of the counter and to admonish it that new statutes required the consent of Lübeck, Wisby, Riga, Dorpat and Reval. This action was confirmed in 1366 by an assembly of the Hansa which at the same time, on the occasion of a regulation made by the Bruges counter and of statutes drawn up by the young Bergen counter, ordered that in future the approval of the towns must be obtained for all new regulations.

The counter at London was soon forced to follow the example of the other counters at Bruges, Novgorod and Bergen. After the failure of the Italians, the Hanseatics remained the strongest group of alien merchants in England, and, as such, claimed the exclusive enjoyment of the privileges granted by the Cura Mercatoria of 1362. Their highly favoured position in England, contrasting markedly with their refusal of trade facilities to the English in some of the Baltic towns and their evident policy of monopoly in the Baltic trade, incensed the English mercantile classes, and doubtless increased the influences in customs-duities which were regarded by the Germans as contrary to their treaty rights. Unsuccessful in obtaining redress from the English government, the German merchants finally, in 1374, appealed for aid to the home towns, especially to Lübeck. The result of Hanseatic representations was the confirmation by Richard II. of the old confraternity, which accorded them the preferential treatment they had claimed and became the foundation of the Hanseatic position in England.

In the meanwhile, the conquest of Wisby by Waldemar IV. of Denmark in 1361 had disclosed his ambition for the political control of the Baltic. He was promptly opposed by an alliance of Hanse towns, led by Lübeck. The defeat of the Germans at Helsingborg only called into being the stronger town and territorial alliance of 1367, known as the Cologne Confederation, and the assumption of a last, Lübeck official could declare that "whatsoever one town touches all." But even at the time when union was most important, this statement went further than the facts would warrant, and in the course of the following century it became less and less true. Dortmund held aloof from the Cologne Confederation on the ground that it had no concern in Scandinavian politics. It became, indeed, increasingly difficult to obtain the support of the inland towns for a policy of sea-power in the Baltic. Cologne sent no representatives to the regular Hanseatic assemblies until 1383, and during the 15th century its independence was frequently manifested. It rebelled at the alleged victory, with the peace of Stralsund in 1370, which gave a limited Hanseatic exclusive treatment to the hands of the Hanseatic towns, greatly enhanced the prestige of the League.

The assertion of Hanseatic influence in the two decades, 1360 to 1377, marks the zenith of the League's power and the completion of the long process of unification. Under the pressure of commercial and political necessity, authority was definitely transferred from the Hansas of merchants abroad to the Hansa of towns at home, and the sense of unity had become such that in 1377 the Lübeck official could declare that "whatever one town touches all." But even at the time when union was most important, this statement went further than the facts would warrant, and in the course of the following century it became less and less true. Dortmund held aloof from the Cologne Confederation on the ground that it had no concern in Scandinavian politics. It became, indeed, increasingly difficult to obtain the support of the inland towns for a policy of sea-power in the Baltic. Cologne sent no representatives to the regular Hanseatic assemblies until 1383, and during the 15th century its independence was frequently manifested. It rebelled at the alleged victory, with the peace of Stralsund in 1370, which gave a limited Hanseatic exclusive treatment to the hands of the Hanseatic towns, greatly enhanced the prestige of the League. Its headship of the League, hitherto tacitly accepted, was definitely recognized in 1418.

The governing body of the Hansa was the assembly of town representatives, the "Hansetage," held irregularly as occasion required at the summons of Lübeck, and, with few exceptions, attended but scantily. The delegates were bound by instructions from their towns and had to report home the decisions of the assembly for acceptance or rejection. In 1450 the League declared that the English use of the terms "societas," "collegium" and "universitas" was inappropriate to so loose an organization. It preferred to call itself a "firma confederation" for trade purposes only. It had no common seal, though that of Lübeck was accepted, particularly by foreigners, in behalf of the League. Disputes between the confederate towns were brought for adjudication before the general assembly, but the League had no recognized federal judiciary. Lübeck, with the counters abroad, watched over the execution of the measures voted by the assembly, but there was no regular administrative
organization. Money for common purposes was raised from time to time, as necessity demanded, by the imposition on Hanse merchant of poundage dues, introduced in 1361, while the rulers relied upon a small levy of like nature and upon fines to meet current needs. Even this slender financial provision met with opposition. The German Order in 1398 converted the Hanseatic poundage to a territorial tax for its own purposes, and one of the chief causes for Cologne's disaffection a half-century later was the extension from Flanders to other parts of the Netherlands of the levy made by the counter at Bruges. Since the authority of the League rested primarily on the moral support of its members, allied in common trade interests and acquiescing in the able leadership of Lübeck, its only means of compulsion was the "Verhansung," or exclusion of a recalcitrant town from the benefits of the trade privileges of the League. A conspicuous instance was the exclusion of Cologne from 1471 until its obedience in 1476, but the penalty had been earlier imposed, as in the case of Brunswick, on towns which overthrew their patrician governments. It was obviously, however, a measure to be used only in the last resort and with extreme reluctance. The Hanseatic League, or Hanserecesse, was the historical right of the citizens of a town to participate in Hanseatic privileges abroad. At first the merchant Hansas had shared these privileges with almost any German merchant, and thus many little villages, notably those in Westphalia, ultimately claimed membership. Later, under the Hansa of the towns, the struggle for the maintenance of a coveted position abroad led to a more exclusive policy. A few new members were admitted, mainly from the westernmost phase of Hanseatic influence, but membership was refused to some important applicants. In 1447 it was noted that admission be granted only by unanimous consent. No complete list of members was ever drawn up, despite frequent requests from foreign powers. Contemporaries usually spoke of 70, 72, 73 or 77 members, and perhaps the list is complete with Daenell's recent count of 72, but the obscurity on so vital a point is significant of the amorphous character of the organization.

The towns of the League, stretching from Thorn and Krakow on the East to the towns of the Zuider Zee on the West, and from Wisby and Reval in the North to Göttin in the South, were arranged in groups, following in the main the territorial divisions. Separating the exclusive factors and limiting membership in the League, both of local and Hanseatic affairs, and gradually, but not fully until the 16th century, the groups became recognized as the lowest stage of Hanse organization. The further grouping into "Thirds," later "Quarters," under head-towns, was also more emphasized in that century.

In the 15th century the League, with increasing difficulty, held a defensive position against the competition of strong rivals and new trade-routes. In England the inevitable conflict of interests between the new mercantile power, growing conscious of its national strength, and the old, standing insistent on the letter of its privileges, was postponed by the factional discord out of which the Hansa in 1474 dexterously snatched a renewal of its rights. Under Elizabeth, however, the English Merchant Adventurers could finally rejoice at the withdrawal of privileges from the Hanseatics and their concession to England, in return for the retention of the Steelyard, of a factory in Hamburg. In the Netherlands the Hanseatics clung to their position in Bruges until 1540, while trade was migrating to the ports of Antwerp and Amsterdam. By the peace of Copenhagen in 1441, after the unsuccessful war of the League with Holland, the attempted monopoly of the Baltic was broken, and, though the Hanseatic trade regulations were maintained on paper, the Dutch with their larger ships increased their hold on the herring fisheries, the French salt trade, and the Baltic grain trade. For the Russian trade new competitors were emerging in southern Germany. The Hanseatic embargo against Bruges from 1451 to 1457, its later war and embargo against England, the Turkish advance closing the Italian Black Sea trade with southern Russia, all were utilized by Nuremberg and its fel lows to secure a landtrade outside the sphere of Hanseatic influence. The fairs of Leipzig and Frankfort-on-Main rose in importance as Novgorod, the stronghold of Hanse trade in the East, was weakened by the attacks of Ivan III. The closing of the Novgorod counter in 1494 was due not only to the development of the Russian State but to the exclusive Hanseatic policy which had stimulated the opening of competing trade routes.

Within the League itself increasing restiveness was shown under the restrictions of its trade policy. At the Hanseatic assembly of 1409, Danzig, Hamburg and Breslau opposed the maintenance of a compulsory staple at Bruges in the face of the new competition of a land route, more secure and more advantageous markets. Complaint was made of South German competition in the Netherlands. "Those in the Hansa," protested Breslau, "are fettered and must decline and those outside the Hansa are free and prosper." By 1477 even Lübeck had become convinced that a continuance of the effort to maintain the compulsory staple against Holland was futile and should be abandoned. But while it was found impossible to enforce the staple or to close the Sound against the Dutch, other features of the monopolistic system of trade regulations were still upheld. It was forbidden to divide with their imperfect union or to co-ownership of ships, to trade in non-Hanseatic goods, to buy or sell on credit in a foreign mart or to enter into contracts for future delivery. The trade of foreigners outside the gates of Hanse towns or with others than Hanseatics was forbidden in 1417, and in the Eastern towns the retail trade of strangers was strictly limited. The whole system was designed to suppress the competition of outsiders, but the divergent interests of individuals and towns, the pressure of competition and changing commercial conditions, in part the reactionary character of the legislation, made enforcement difficult. The measures were those of the late-medieval town economy applied to the whole region of the German Baltic trade, but not supported, as was the analogous mercantilist system, by a strong central government.

Among the factors, economic, geographic, political and social, which combined to bring about the decline of the Hanseatic League, none was probably more influential than the absence of a German political power comparable in unity and energy with those of France and England, which could quell particularism at home, and abroad maintain its vigour the trade which those in Germany's disunion had upheld the honour of her commerce. Nothing was to be expected from the declining Empire. Still less was any co-operation possible between the towns and the territorial princes. The fatal result of conflict between town autonomy and territorial power had been taught in Flanders. The Hanseatics regarded the princes with a growing and exaggerated fear and found some relief in the formation in 1418 of a thrice-renewed alliance, known as the "Tohopesat," against princely aggression. But no territorial power had as yet arisen in North Germany capable of subjugating and utilizing the towns, though it could detach the inland towns from the League. The last wars of the League with the Scandinavian powers in the 16th century, which left it shorn of many of its privileges and of any pretension to control of the Baltic basin eliminated it as a factor in the later struggle of the Thirty Years' War for that control. At an assembly of 1629, Lübeck, Bremen and Hamburg were entrusted with the task of safeguarding the general welfare, and after an effort to revive the League in the last general assembly of 1669, these three towns were left alone to preserve the name and small inheritance of the Hansa which in Germany's disunion had upheld the honour of her commerce. Under their protection, the three remaining counters lingered on until their buildings were sold at Bergen in 1775, at London in 1852 and at Antwerp in 1865.

the above-mentioned chief sources have been used by the Verein für hanische Geschichte. Of the secondary literature, the following histories and monographs should be named: G. F. Sartorius, Geschichte des hansaansischen Bundes (3 vols., Göttingen, 1802–1808), Urbundliche Geschichte des Ursprunges der deutschen Hanse, herausge- geben von M. L. Lepsius, Jena, 1842; J. A. Scharer, Geschichte der deutschen Hansa (3 vols., 2nd ed., Leipzig, 1862); D. Schäfer, Die Hansa-Städte und König Waldemar von Dänemark (Jena, 1879); W. Stein, Beiträge zur Geschichte der deutschen Hansa (3 vols., 2nd ed., Hamburg, 1900); E. Daenell, Die Blätterzeit der deutschen Hanse. Hansische Geschichte von der zweiten Hälfte des XIV. bis zum letzten Viertel des XV. Jahrhunderts (3 vols., Berlin, 1905–1906); J. M. Lappenberg, Urbundliche Geschichte des hansaanschen Stahlhofes zu London (Hamburg, 1851); F. Keutgen, Die Beziehungen der Hanse zu England im letzten Drittel des vierzehnten Jahrhunderts (Giessen, 1890); R. Ehrenberg, Hamburg in England im Zeitalter der Königin Elisabeth (Jena, 1896); W. Stein, Die Genossenschaft der deutschen Kaufleute zu Brügge in Flandern (Berlin, 1890); H. Rogge, Der Stabepeweg der hansischen Kontors zu Brügge in fünfzehn Jahren, nel. 1903; A. Winckler, Die deutsche Hansa in Russland (Berlin, 1886). (E. F. G.)

HANSEN, PETER ANDREAS (1705-1874), Danish astronomer, was born on the 8th of December 1705, at Tondern, in the duchy of Schleswig. The son of a goldsmith, he learned the trade of a watchmaker at Flensburg, and exercised it at Berlin and Tondern, 1818–1820. He had, however, long been a student of science; and Dr Dürcks, a physician practising at Tondern, prevailed with his father to send him in 1820 to Copenhagen, where he won the patronage of H. C. Schumacher, and attracted the personal notice of J. P. King. In 1821-1825, Hansen's Danish survey was then in progress, and he acted as Schumacher's assistant in work connected with it, chiefly as the new observatory of Altona, 1821-1825. Thence he passed on to Gotha as director of the Seeberg observatory; nor could he be tempted to relinquish the post by successive invitations to replace F. G. W. Struve at Dorpat in 1829, and F. W. Bessel at Königsberg in 1847. The problems of gravitational astronomy engaged the chief part of Hansen's attention. A research into the mutual perturbations of Jupiter and Saturn secured for him the prize of the Berlin Academy in 1830, and a memoir on cometary disturbances, was crowned by the Paris Academy in 1850. In 1838 he published a revision of the lunar theory, entitled Fundamenta nova investigationis, εc., and the improved Tables of the Moon based upon it were printed in 1857, at the expense of the British government, their merit being further recognized by a grant of £1000, and their immediate adoption in the Nautical Almanac, and other Ephemerides. A theoretical discussion of the disturbances embodied in them (still familiarly known to lunar experts as the 'Dorpat') appeared in the Abhandlungen of the Saxon Academy of Sciences in 1862-1864. Hansen's Danish survey was famous throughout the world, and was twice (in 1842 and 1860) the recipient of the Royal Astronomical Society's gold medal. He communicated to that society in 1847 an able paper on a long-period lunar inequality (Memoirs Roy. Astr. Society, xvi. 465), and in 1854 one on the moon's figure, advocating the mistaken hypothesis of its deformation by a huge elevation directed towards the earth (ibid. xxiv. 26). He was awarded the Copley medal by the Royal Society in 1859, and his Solar Tables, compiled with the assistance of Christian Olufsen, appeared in 1854. Hansen gave in 1854 the first great lunar table which had been compiled on the principle that the moon is a planet great by some millions of miles (Monthly Notices Roy. Astr. Soc. xv. 9), the error of J. F. Encke's result having been rendered evident through his investigation of a lunar inequality. He died on the 28th of March 1874, at the new observatory in the town of Gotha, erected under his care in 1857.

HANSI, a town of British India, in the Hissar district of the Punjab, on a branch of the Western Jumna canal, with a station on the Rewari-Ferozepore railway, 16 m. E. of Hissar. Pop. (1901) 16,523. Hansi is one of the most ancient towns in northern India, the former capital of the tract called Hariana.
d’un voyage en Sibérie (1857); but the chief work was not issued till 1863 (Resulства магнитесrьhъ Beobachtungen, &c.). Shortly after the return of the mission, an observatory was erected in the park of Christiania (1833), and Hansteen was appointed director. On his representation a magnetic observatory was added in 1839. In 1835–1838 he published text-books on geometry and mechanics; and in 1842 he wrote his Disquisitiones de mutationibus quas petitor momentum acus magneticae, &c. He also contributed various papers to different scientific journals, especially the Magazin für Naturwissenshaften, of which he became joint-editor in 1843. He superintended the trigono-
nomical and topographical survey of Norway begun in 1837.
In 1841 he retired from active work, but still pursued his studies, his Observations de l’inclinaison magnétique et Sur les variations scédales du magnétisme appearing in 1865. He died at Christiania on the 11th of April 1873.

HANTHAWADDY, a district in the Pegu division of Lower Burma, the home district of Rangoon, from which the town was detached to make a separate district in 1850. It has an area of 3023 sq. m., with a population in 1901 of 434,811, showing an increase of 22% in the decade. Hanthawaddy and Henzada are the two ancient and densely populated districts in the province. It consists of a vast plain stretching up from the sea between the Te or China Bakir mouth of the Irrawaddy and the Pegu Yomas. Except the tract lying between the Pegu Yomas on the east and the Hlaing river, the country is intersected by numerous tidal creeks, many navigable by large boats and some by steamers. The headquarters of the district is in Rangoon, which is also the sub-divisional headquarters. The second sub-division has its headquarters at Insein, where there are large railway works. Cultivation is almost wholly confined to rice, but there are many vegetable and fruit gardens.

HANNUKAH, a Jewish festival, the "Feast of Dedication" (cf. John x. 22) or the "Feast of the Maccabees," beginning on the 25th day of the ninth month Kislev (December), of the Hebrew ecclesiastical year, and lasting eight days. It was instituted in 165 B.C. in commemoration of, and thanksgiving for, the purification of the temple at Jerusalem on this day by Judas Maccabaeus after its pollution by Antiochus Epiphanes, king of Syria, who in 168 B.C. set up a pagan altar to Zeus Olympia. The Talmudic sources say that when the perpetual lamp of the temple was to be re-lighted only one flask of holy oil sufficient for the day remained, but this miraculously lasted for the eight days (cf. the legend in 2 Macc. i. 18). In memory of this the Jews burn both in synagogues and in houses on the first night of the festival one light, on the second two, and so on to the end (so the Hillelites), or vice versa eight lights on the first, and one less on each succeeding night (so the Shammaites). From the prominence of the lights the festival is also known as the "Festival of Lights" or "Illumination" (Talmud). It is said that the day chosen by Judas for the setting up of the new altar was the anniversary of that on which Antiochus had set up the pagan altar; hence it is suggested (e.g. by Wellhausen) that the 25th of Kislev was an old pagan festival, perhaps the day of the winter solstice.

For further details and illustrations of Hanukkah lamps see Jewish Encyc., s.v.

HANUMAN, in Hindu mythology, a monkey-god, who forms a central figure in the Ramayana. He was the child of a nymph by the god of the wind. His exploits, as the ally of Rama (incarnation of Vishnu) in the latter’s recovery of his wife Sita from the clutches of the demon Ravana, include the bringing of the straits between India and Ceylon with huge boulders carried away from the Himalayas. He is the leader of a host of monkeys who aid in these supernatural deeds. Temples in his honour are frequent throughout India.

HANWAY, JONAS (1712–1780), English traveller and philanthropist, was born at Portsmouth in 1712. While still a child, his father, a victualler, died, and the family moved to London. In 1729 Jonas was apprenticed to a merchant in Lisbon. In 1743, after he had been some time in business for himself in London, he became a partner with Mr Dingley, a merchant in St Peterburg, and in this way was led to travel in Russia and Persia. Leaving St Peterburg on the 10th of September 1745; and passing south by Moscow, Tarsiffs and Astrakhan, he embarked on the Caspian on the 22nd of November, and arrived at Astrabad on the 18th of December. Here his goods were seized by Mohammed Hassan Beg, and it was only after great privations that he reached the camp of Nadir Shah, under whose protection he recovered most (85%) of his property. His return journey was embarrased by sickness (at Resht), by attacks from pirates, and by six weeks’ quarantine; and he only reappeared at St Petersburg at the 1st of January 1745. He again left the Russian capital on the 9th of July 1750 and travelled through Germany and Holland to England (28th of October). The rest of his life was mostly spent in London, where the narrative of his travels (published in 1753) soon made him a man of note, and where he devoted himself to philanthropy and good citizenship. In 1756 he founded the Marine Society, to keep up the supply of British seamen; in 1758 he became a governor of the Foundling, and established the Magdalen, hospital; in 1761 he procured a better system of parochial birth-registration in London; and in 1762 he was appointed a commissioner for victualling the navy (10th of July); this office he held till October 1783. He died, unmarried, on the 5th of September 1786. He was the first Londoner, it is said, to carry an umbrella, and he lived to triumph over all the hackney coachmen who tried to hoot and hustle him down. He attacked "vail-giving," or tipping, with some temporary success; by his onslaught upon tea-drinking he became involved in controversy with Johnson and Goldsmith. His last efforts were on behalf of little chimney-sweeps. His advocacy of solitary confinement for prisoners and opposition to Jewish naturalization were more questionable instances of his activity in social matters.

HANWELL, an urban district in the Brentford parliamentary division of Middlesex, England, 103 m. W. of St Paul’s cathedral, London, on the river Brent and the Great Western railway. Pop. (1891) 6730; (1901) 10,438. It ranks as an outer residential suburb of London. The Hanwell lunatic asylum of the county of London has been greatly extended since its erection 1831, and can accommodate over 2500 inmates. The extensive cemeteries of St Mary Abbs, Kensington, and St George, Hanover Square, London, are here. In the churchyard of St Mary’s church was buried Jonas Hanway (d. 1786), traveller, philanthropist, and by repute, introducer of the umbrella into England. The Roman Catholic Convalescent Home for women and children was erected in 1865. Before the Norman period the manor of Hanwell belonged to Westminster Abbey.

HAPARANDA (Finnish Haaparanta, “Aspen Shore”), a town of Sweden in the district (län) of Norbotten, at the head of the Gulf of Bothnia. Pop. (1900) 1568. It lies about 13 m. from the mouth of the Torne river, on the frontier with Russia (Finland), opposite the town of Torneå which has belonged to Russia since 1809. The towns are divided by a marshy channel, formerly the bed of the Torne, but the main stream is now east of the Russian town. Haparanda was founded in 1812, and at first bore the name of Karljohansstad. It received its municipal constitution in 1842. Shipbuilding is prosecuted. Sea-going vessels load and unload at Salmio, 7 m. from Haparanda. Since 1859 the town has been the seat of an important meteorological station. Annual mean temperature, 32° Fahr.; February 10°–5°; July 58°–68°. Rainfall, 165 in. annually. Up the Torne valley (54 m.) is the hill Avassaxa, whither pilgrimages were formerly made in order in 1865 to light the sun at midnight on St John’s day (June 24).
HAPLODRILI (so called by Lankester), often called Archian-neldia (Hatschek), the name provisionally given to a number of

live in sand, but while the former moves by means of the contraction of its body-wall muscles, Protodrilus can progress by the action of the bands of cilia surrounding its segments, and of the longitudinal ciliated ventral groove. Sacocirrus, which also lives in sand, and more closely resembles the Polychaeta, has throughout the greater length of its body on each segment a pair of small uniramous parapodia bearing a bunch of simple setae. No other member of the group is known to have any trace of setae or parapodia at any stage of development.

These three genera have the following characters in common. The body is composed of a large number of segments; the stomatium bears a pair of tentacles; the nervous system consists of a brain and longitudinal ventral nerve cords closely connected with the epidermis (without distinct ganglia), widely separated in Sacocirrus and closely approximated in Protodrilus, fused together in Polygordius; the coelom is well developed, the septa are distinct, and the dorsal and ventral longitudinal mesenteries are complete; the nephridia are simple, and open into the coelom. Polygordius differs from Protodrilus and Sacocirrus in the absence of a distinct suboesophageal muscular bunch, and in the absence of a peculiar closed cavity in the head region, which is especially well developed in Sacocirrus, and probably represents the specialized coelom of the first segment. Moreover, in Sacocirrus the genital organs, present in the majority of the trunk segments, have become much complicated (fig. 2). In the female there is in every fertile segment a pair of spermathecae opening at the nephridiopores. In the male there are a right and a left protrusible penis in every genital segment, into which opens the nephridium and a sperm-sac. The wide funnels of the nephridia of this region are possibly of coelomic origin.

Dinophilus is a free-swimming form without tentacles, and with segmental bands of cilia (fig. 1). The parasitic Histriodrilus (Histrio-bdella) feeds on the eggs of the lobster. It resembles Dinophilus in the possession of a ventral pharyngeal pouch (which bears teeth in Histriodrilus only), the small number of segments, and absence of distinct septa, the absence of a vascular system, the presence of distinct ganglia on the ventral nerve cords, and of small nephridia which do not appear to open internally. Histriodrilus resembles Sacocirrus in the possession of two posterior adhesive processes, and to some extent in the structure of the complex genital organs, which, however, are restricted to a single segment. In Dinophilus there is also only a single pair of genital ducts behind; and in the male there are sperm-sacs and a median penis. In some species of Dinophilus there is pronounced sexual dimorphism (the male being small and without gut) as in the Rotifera. The resemblance of Dinophilus to the male of the same, Polygordius, is, however, quite superficial, as the general structure of this genus with distinct traces of segmentation, especially in the embryo, points to its close affinity, if not to Polygordius in particular, at all events to the Annelida.

Polygordius and Protodrilus are on the whole primitive forms, and related to each other, there can be little doubt, but their place amongst the Annelida is difficult to determine. The development of Polygordius alone is known, having been studied by Hatschek, Fraipont and others. The larva (fig. 1, C and D) is a typical but very specialized form of trochophore, provided with a branching nephridium bearing solenocytes. The trunk develops on the lower surface of the disk-like larva, which undergoes a more or less sudden metamorphosis into the young worm (fig. 1). There appears to be little either in the development or in the structure of the Polygordius, Protodrilus and Polygordius are exceedingly primitive forms, ancestral to the whole group of seta-bearing Annelids (Oligochaeta, Polychaeta, Hirudinea and Echiuroidea).

Fig. 2.—Diagram of a transverse section of Sacocirrus showing on the left side the organs in a genital segment of a male, and on the right side the organs in a genital segment of a female. (From Goodrich.)
HAPUR, a town of British India in the Meerut district of the United Provinces, 18 m. S. of Meerut. Pop. (1901) 17,796. It is said to have been founded in the 10th century, and was granted by Sindhi to his French general Perron at the end of the 18th century. Several fine groves surround the town, but the wall and ditch have fallen out of repair, and only the names of the five gates remain. Considerable trade is carried on in sugar, grain, cotton, timber, bamboo and brass utensils.

HARA-KIRI (Japanese hara, belly, and kiri, cutting), self-disembowelment, primarily the method of suicide permitted to offenders of the noble class in feudal Japan, and later the national form of honourable suicide. Hara-kiri has been often translated as "the happy dispatch" in confusion with a native euphemism for the act. More usually the Japanese themselves speak of hara-kiri by its Chinese synonym, Sheppuku. Hara-kiri is not an aboriginal Japanese custom. It was a growth of medieval militarism, the act probably at first being prompted by the desire of the noble to escape the humiliation of falling into the hands of an enemy. By the end of the 15th century the custom had become a much valued privilege, being formally established as such under the Ashi-Kaga dynasty. Hara-kiri was of two kinds, obligatory and voluntary. The first is the more ancient. An official or noble, who had broken the law or been disloyal, received a message from the emperor, couched always in sympathetic and gracious tones, courteously intimating that he must die. The mikado usually sent a jewelled dagger with which the deed might be done. The suicide had so many days allotted to him by immemorial custom in which to make dignified preparations for the ceremony, which was attended by the utmost formality. In his own baronial hall or in a temple a daïs 3 or 4 in. from the ground was constructed. Upon this was laid a rug of red felt. The suicide, clothed in his ceremonial dress as an hereditary noble, and accompanied by his second or "Kaishaku," took his place on the mat, the officials and his friends ranging themselves in a semicircle round the daïs. After a minute's prayer the weapon was handed to him with many obeisances by the mikado's representative, and he then made a public confession of his fault. He then stripped to the waist. Every movement in the grim ceremony was governed by precedent, and he had to tuck his wide sleeves under his knees to prevent himself falling backwards, for a Japanese noble must die falling forward. A moment later he plunged the dagger into his stomach below the waist on the left side, drew it across to the right and, turning it, gave a slight cut upward. At the same moment the Kaishaku who crouched at his friend's side, leaping up, brought his sword down on the outstretched neck. At the conclusion of the ceremony the bloodstained dagger was taken to the mikado as a proof of the consummation of the heroic act. The performance of hara-kiri carried with it certain privileges. If it was by order of the mikado half only of a traitor's property was forfeited to the state. If the sentiment of conscience drove the disloyal noble to voluntary suicide, his disgrace was wiped out, and his family inherited all his fortune.

Voluntary hara-kiri was the refuge of men rendered desperate by private misfortunes, or was committed from loyalty to a dead superior, or as a protest against what was deemed a false national policy. This voluntary suicide still survives, a characteristic case being that of Lieutenant Takeyoshi who in 1891 gave himself this dignity in protest against the execution of his ancestors in Japan, and as a protest against what he considered the criminal leaguer of the government in not taking precautions against possible Russian encroachments to the north of Japan. In the Russo-Japanese War, when faced by defeat at Vladivostock, the officer in command of the troops on the transport "Kinshu Maru" committed hara-kiri. Hara-kiri has not been uncommon among women, but in their case the mode is by cutting the throat. The popularity of this self-immolation is testified to by the fact that for centuries no fewer than 1,500 hara-kiris are said to have been made annually at the hands of the war department.

The history of the practice of hara-kiri is best told in connection with the performance of the act. One noble, barely out of his teens, not content with giving himself the customary cuts, slashed himself thrice horizontally and twice vertically. Then he stabbed himself in the throat until the dirk protruded on the other side with the sharp edge to the front, and with a supreme effort drove the knife forward with both hands through his neck. Obligatory hara-kiri was obsolete in the middle of the 19th century, and was actually abolished in 1868.

HARALD, the name of four kings of Norway.

Harald I. (850-933), surnamed Haarfager (of the beautiful hair), first king over Norway, succeeded on the death of his father Halfdan the Black in A.D. 860 to the sovereignty of several small and somewhat scattered kingdoms, which had come into his father's hands through conquest and inheritance and lay chiefly in south-east Norway (see NORWAY). The tale goes that the son of the daughter of a neighbouring king induced Harald to take a vow not to cut nor comb his hair until he had worn a crown. Being sole king of Norway, and that ten years later he was justified in trimming it; whereupon he exchanged the epithet "Shockhead" for the one by which he is usually known. In 866 he made the first of a series of conquests over the many petty kingdoms which then composed Norway; and in 872, after a great victory at Hafsfjord near Stavanger, he found himself king over the whole country. His realm was, however, threatened by dangers from without, as large numbers of his opponents had taken refuge, not only in Iceland, then recently discovered, but also in the Orkneys, Shetlands, Hebrides and Faeroes, and in Scotland itself; and from these winter quarters sailed forth to harry Norway as well as the rest of northern Europe. Their numbers were increased by malcontents from Norway, who resented Harald's claim of rights of taxation over lands which the possessors appear to have previously held in absolute ownership. At last Harald was forced to make an expedition to the west to clear the islands and Scottish mainland of Vikings. Numbers of them fled to Iceland, which grew into an independent commonwealth, while the Scottish Isles fell under Norwegian rule. The latter part of Harald's reign was disturbed by the strife of his many sons. He gave them all the royal title and assigned lands to them which they were to govern as his representatives; but this arrangement did not put an end to the discord, which continued into the next reign. When he grew old he handed over the supreme power to his favourite son Erik "Bloody Axe," whom he intended to be his successor. Harald died in 933, in his eighty-fourth year.

Harald II., surnamed Graefald, a grandson of Harald I., became, with his brothers, ruler of the western part of Norway in 961; he was murdered in Denmark in 969.
HARLAND III. (1515-1666), king of Norway, surnamed Haar- 
draade, which might be translated "ruthless," was the son of King Sigurd and half-brother of King Olaf the Saint. At the age of fifteen he was obliged to flee from Norway, having taken part in 
the battle of Stiklestad (1030), at which King Olaf met his death. He 
took refuge for a short time with Prince Yaroslav of Novgorod (a 
kingsdom founded by Scandinavians), and thence went to 
Constantinople, where he took service under the empress Zoe, 
whose Varangian guard he led to frequent victory in Italy, 
Sicily and North Africa, also penetrating to Jerusalem. In the 
year 1038, he left Constantinople the same way because he was 
refused the hand of a princess, and on his way back to his own 
country he married Ellais or Elizabeth, daughter of Yaroslav of 
Novgorod. In Sweden he allied himself with the defeated 
Sven of Denmark against his nephew Magnus, now king of 
Norway, but soon broke faith with Sven and accepted an offer 
from Magnus of half his kingdom. In return for this gift Harald 
is said to have shared with Magnus the enormous treasure which he 
had amassed in the East. The death of Magnus in 1047 
put an end to the growing jealousies between the two kings, 
and Harald turned all his attention to the task of subjugating 
Denmark, which he ravaged year after year; but he met with 
such stubborn resistance from Sven that in 1064 he gave up the 
attempt and made peace. Two years afterwards, possibly 
istigated by the banished Eari Tostig of Northumbria, he 
attempted the conquest of England, to the sovereignty of which 
his predecessor had advanced a claim as successor of Harthacnut. 
In September 1066 he landed in Yorkshire with a large army, 
reinforced from Scotland, Ireland and the Orkneys; took 
Scarborough by casting flaming brands into the town from 
the high ground above it; defeated the Northumbrian forces at 
Fulford; and entered York on the 24th of September. But 
the following day the English Harold arrived from the south, and 
the end of the long day's fight at Stamford Bridge saw the rout 
of the Norwegian forces after the fall of their king (25th 
of September 1066). He was only fifty years old, but he was 
the first of the six kings who had ruled Norway since the death 
of Harald Haarfager to reach that age. As a king he was unpopular 
on account of his harshness and want of good faith, but his many 
victories in the face of great odds prove him to have been a 
remarkable general, of never-failing resourcefulness and indomiti-
d命 spirit.

HARLAND IV. (d. 1136), king of Norway, surnamed Gy lance 
(probably from Gylle Krist, i.e. servant of Christ), was born in 
Ireland about 1103. About 1127 he went to Norway 
and declared he was a son of King Magnus III. (Barefoot), who had 
visited Ireland just before his death in 1103, and consequently 
was the half-brother of the reigning king, Sigurd. He appears to have 
submitted successfully to the ordeal of fire, and the alleged 
relationship was acknowledged by Sigurd on condition 
that Harald did not claim any share in the government of the kingdom 
during his lifetime or that of his son Magnus. Living on friendly 
terms with the king, Harald kept this agreement until Sigurd's 
death in 1130. Then war broke out between himself and Magnus, and 
after several battles the latter was captured in 1134, his eyes 
were put out, and he was thrown into prison. Harald now ruled 
the country until 1136, when he was murdered by Sigurd Slembi-
Diakn, another bastard son of Magnus Barefoot. Four of 
Harald's sons, Sigurd, Ingi, Eysteinn and Magnus, were subse-
sequently kings of Norway.

HABIN, or Harbin, town of Manchuria, on the right bank 
of the river Sungari. Pop. about 20,000. Till 1896 there was 
only a small settlement here, but in that year the town was 
officially founded in connexion with surveys for the Chinese Eastern 
railway company, at a point which subsequently became the 
junction of the main line of the Manchurian railway with the 
branch line southward to Port Arthur. Occupying such a 
position, Harbin became an important Russian military centre 
during the Russo-Japanese War. The portion of the town 
officially founded in 1896 is called Old Harbin, but the centre has shifted 
to New Harbin, where the chief public buildings and offices of the 
railway administration are situated. The river-port forms 
a third division of the town, industrially the most important; 
here are railway workshops, factories and mercantile establish-
ments. Trade is chiefly in the hands of the Chinese.

HARBINGER, originally one who provides a shelter or lodging 
for an army. The word is derived from the M.E. and O.Fr. 
herbergere, through the Late Lat. herbergator, formed from the 
O.H.Ger. heri, mod. Ger. Heer, an army, and borgen, shelter 
or defence, cf. "habour." The meaning was soon enlarged to 
include any place where travellers could be lodged or entertained, 
and also by transference the person who provided lodgings, and 
so he was on the way before a party to secure suitable lodgings in 
advance. A herald sent forward to announce the coming of 
a king. A Knight Harbinger was an officer in the royal household 
till 1846. In these senses the word is now obsolete. It is used 
chiefly in poetry and literature for one who announces the 
immediate approach of something, a forerunner. This is illustrated 
in the "habering of spring," a name given to a small 
plant belonging to the Umbelliferae, which has a trebuous root, 
and small white flowers; it is found in the central states of North 
America, and blossoms in March.

Horribly, however, from M.E. or L.Ger. here, here, an army; cf. Ger. Heer 
and -beorg, protection or shelter. Other early forms in English 
were herberwe and harbourow, as seen in various place 
names, such as Market Harborough. The French auberge, an inn, 
derived through hebérer, is thus the same word), a place 
of refuge or shelter. It is thus used for an asylum for criminals, 
and particularly for a place of shelter for ships.

Sheltered sites along exposed sea-coasts are essential for 
poses of trade, and very valuable as refuges for vessels from 
storms. In a few places, natural shelter is found in combination 
with ample depth, as in the Bay of Rio de Janeiro, New York 
Harbour (protected by Long Island), Portsmouth Harbour and 
Southampton Water (sheltered by the Isle of Wight), and the 
land-locked creeks of Milford Haven and Kiel Harbour. At 
various places there are large enclosed areas which have openings 
to the sea; but these lagoons for the most part are very 
sheltered except in the main channels and at their outlets. Access to 
them is generally obstructed by a bar as at the lagoon 
harbour of Venice (fig. 1), and similar harbours, like those of 
Poole and Wexford; and such harbours usually require works to 
prevent their deterioration, and to increase the depth near their 
outlet. Commercial harbours have to be provided for the 
formation of ports within their shelter; on important 
trade routes, or for the protection of the approaches from 
the sea of ports near the sea-coast, or maritime waterways running 
inland, in some cases at points on the coast devoid of any 
natural shelter. A greater latitude in the selection of suitable sites is, 
indeed, possible for refuge and naval harbours than for commercial 
harbours; but these three classes of harbours are very similar 
in their general outline and the works protecting them, only 
differing in size and internal arrangements according to the purpose 
for which they have been constructed, the chief differences 
being due to the local conditions.

Harbours may be divided into three distinct groups, namely 
lagoon harbours, jetty harbours and sea-coast harbours, 
protected by breakwaters, including refuge, naval and commercial 
harbours.

Lagoon Harbours.—A lagoon, consisting of a sort of large shallow 
lake separated from the sea by a narrow belt of coast, formed of 
regularly spaced sand-dunes and dunes, behind and dug up by on-shore 
winds along a sandy shore, possesses good natural shelter; and, 
owing to the large expanse which is filled and emptied at each tide, 
even when the tidal range is quite small, together with the discharge
from any rivers flowing into the lagoon, one or more fairly deep outlets are maintained through the fringe of coast, which afford navigable access to the lagoon; whilst channels formed inside by

Jetty Harbours.—Several small ports were formed on the sea-coast long ago at points where flat marshy ground lying below the level of high-water, and shut off from the sandy beach by dikes or sand dunes, was connected with the sea by a small creek or river. Such ports presented in their original condition a slight resemblance to lagoons on a very small scale. Several examples are to be found on the sandy shores of the English Channel and North Sea, such as Dieppe, Boulogne, Calais, Dunkirk, Nieuport and Ostend, where the influx and eflux of the water from these enclosed tide-covered areas, through a narrow opening, sufficed to maintain a shallow channel across the beach, deep enough near high-water for vessels of small draught. When the increase in draught necessitated the provision of an improved channel, the scour of the issuing current was concentrated and prolonged by erecting parallel jetties across the beach, raised solid to a little above low water of neap tides, with open timber-work above to indicate the channel and guide the vessels. Even this low obstruction, however, to the littoral drift of sand sufficed for the passage of the low water line as the jetties were carried out, so that further extensions of the works had eventually to be abandoned, as occurred at Dunkirk (see Docks). Moreover, reclamation of the low-lying areas was gradually effected, thus reducing the tidal scour; and sluicing basins were excavated in part of the low ground, into which the tide flowed through the entrance channel, and the water being shut in at high tide by gates at the outlet of the basin, was released at low water, producing a rapid current through the channel as a compensation for the loss of the former natural scour. The current, however, from the sluicing basin gradually lost its velocity in passing down the channel, and besides, being most effective near the outlet of the basin, could only scour the channel down to a moderate depth below low-water on account of the increase in the volume of still water in the channel at low tide as its deepening progressed. Lastly, about 1880, improvements in suction dredgers (see Dredge and Dredging) led to the adoption of sand-pump dredging in the outer part of the channel, and across the foreshore in front of deep water; and at Dunkirk, docks were formed on the site of the sluicing basin; whilst at Calais sluicing was abandoned in favour of dredging. Ostend is the only Jetty Harbour in which a large sluicing basin has been recently constructed, but it can only be used for the maintenance of deep-water quays in its vicinity, and dredging is relied upon to an increasing extent, both for the maintenance and further deepening of the outer portion of the approach channel, and for maintaining the direct channel dredged to deep water across the Stroombank extending in front of Ostend (fig. 2).

Similar methods of improving the entrance channel to ports possessing an extensive backwater have been adopted on a large scale in the United States. For instance at Charleston, converging jetties, about 32 m. long, have been extended across the bar to concentrate the scour due to a small tidal range expanding over the enclosed backwater, 15 sq. m. in extent, and to protect the channel from littoral drift; but these jetties have caused an advance of the foreshore, and a progressive seawards of the bar, necessitating dredging beyond the ends of the jetties to maintain the requisite depth.

Parallel jetties, moreover, across the beach, combined with extensive sand-pump dredging, have been employed with success at some of the ports situated at the outlet of rivers, enclosed bays, or lagoons, on the sandy shores of south-east Africa, for improving the access to them across encumbering shoals, where the littoral drift is too great to allow of the protection of breakwaters from the shore to shelter an approach channel.

Harbours Protected by Breakwaters.—The design for a harbour on
the sea-coast must depend on the configuration of the adjacent coast-line, the extent and direction of the exposure, the amount of sheltered area required and the depth obtainable, the prospect of the accumulation of drift or the occurrence of scour from the proposed works, and the best position for an entrance in respect of shelter and depth of approach.

**Completion of Shelter of Harbours in Bays.**—In the case of a deep, fairly landlocked bay, a detached breakwater across the outlet completes the necessary shelter, leaving an entrance between each extremity and the shore; provided there is deep enough water near the shore, as effected at Plymouth harbour, and also across the wider but shallower bay forming Cherbourg harbour. A breakwater may instead be extended across the outlet from each shore, leaving a single central entrance between the ends of the breakwaters; and if one breakwater placed somewhat farther out is made to overlap an inner one, a more sheltered entrance is obtained. This arrangement has been adopted at the existing Genoa harbour within the bay (fig. 3), and for the harbour at the mouth of the Nervion (see River Engineering). The adoption of a bay with deep water for a harbour does not merely reduce the shelter to be provided artificially, but it also secures a site not exposed to silting up, and where the sheltering works do not interfere with any littoral drift along the open coast. A third method of sheltering a deep bay is that adopted for forming a refuge harbour at Peterhead (fig. 4), where a single breakwater is extended out from one shore for 3250 ft. across the outlet of the bay, leaving a single entrance between its extremity and the opposite shore and enclosing an area of about 260 acres at low tide, half of which has a depth of over 5 fathoms.

**Harbours possessing partial Natural Shelter.**—The most common form of harbour is that in which one or more breakwaters supplement a certain amount of natural shelter. Sometimes, where the exposure is from one direction only, approximately parallel with the coast-line at the site, and there is more or less shelter from a projecting headland or a curve of the coast in the opposite direction, a single breakwater extending out at right angles to the shore, with a slight curve or bend inwards near its outer end, suffices to afford the necessary shelter. As examples of this form of harbour construction may be mentioned Newhaven breakwater, protecting the approach to the port from the west, and somewhat sheltered from the moderate easterly storms by Beachy Head, and Table Bay breakwater, which shelters the harbour from the north-east, and is somewhat protected on the opposite side by the wide sweep of the coast-line known as Table Bay. Generally, however, some partial embayment, or abrupt projection from the coast, is utilized as providing shelter from one quarter, which is completed by breakwaters enclosing the site, of which Dover and Colombo (fig. 5) harbours furnish typical and somewhat similar examples.

**Harbours formed on quite Open Sea-coasts.**—Occasionally harbours have to be constructed for some special purpose where no natural shelter exists, and shelter on an open, sandy shore considerable littoral drift may occur. Breakwaters, carried out from the shore at some distance apart, and converging to a central entrance of suitable width, provide the requisite shelter, as for instance the harbour constructed to form a sheltered approach to the river Wear and the Sunderland docks (fig. 6). If there is little littoral drift from the most exposed quarter, sand brought in during storms, which is smaller in proportion to the depth into which the entrance is carried, can be readily removed by dredging; whilst the scour across the projecting ends of the breakwaters tends to keep the outlet free from deposit. Where there is littoral drift in both directions on an open, sandy coast, due to winds blowing alternately from opposite quarters, a very large accretion on the side facing the exposed quarter; whilst owing to the arrest of the travel of sand, erosion of the beach occurs beyond the second breakwater enclosing the harbour on its comparatively sheltered side. These effects have been produced at Port Said harbour at the entrance to the Suez Canal from the Mediterranean, formed by two converging breakwaters, where, owing to the prevalent north-westerly winds, the drift is from west to east, and is augmented by the alluvium issuing from the Nile. Accordingly, the shore has advanced considerably against the outer face of the western breakwater; and erosion of the beach has occurred at the shore end of the eastern breakwater, cutting it off from the land.

The advance of the shore-line, however, has been much slower during recent years; and though the progress seawards of the lines of soundings close to and in front of the harbour continues, the advance is checked by the sand and silt coming from the west passing through some aperture left open at the entrance, and falling into the approach channel, from which it is readily dredged and taken away. Madras harbour, begun in 1875, consists of two breakwaters, 3000 ft. apart, carried straight out to sea at right angles to the shore for 3000 ft., and completed by two return
arms inclined slightly seawards, enclosing an area of 220 acres and leaving a central entrance, 550 ft. wide, facing the Indian Ocean in a depth of about 8 fathoms. The great drift, however, of sand along the coast from south to north soon produced an advance of the shore against the outside of the south breakwater, and erosion beyond the north breakwater; and the progression of the foreshore has extended so far seawards as to produce shoaling at the entrance. Accordingly, the closing of the entrance, and the formation of a new entrance through the outer part of the main north breakwater, facing north and sheltered by an arm starting from the angle of the northern return arm and running north parallel to the shore, round the end of which vessels would turn to enter, have been recommended, to provide a deep entrance beyond the influence of the advancing foreshore.

Proposals have been made from time to time to evade this advance of the foreshore against a solid obstacle, by extending an open viaduct across the zone of littoral drift, and forming a closed harbour, or a sheltering breakwater against which vessels can lie, beyond the influence of accretion. This principle was carried out on a large scale at the port of call and sheltering breakwater constructed in front of the entrance to the Thames ship- canal, at Zeebrugge on the sandy North Sea coast, where a solid breakwater, provided with a wide quay furnished with sidewalks and sheds, and curving round so as to overlap thoroughly the entrance to the canal and shelter a certain water-area, is approached by an open metal viaduct extending out 1007 ft. from low water into a depth of 20 ft. (fig. 7). It is hoped that by thus avoiding interference with the littoral drift close to the shore, coming mainly from the west, the accumulation of silt to the west of the harbour, and also in the harbour itself, will be prevented; and though it appears probable that some accretion will occur within the area sheltered by the breakwater, it will to some extent be disturbed by the wash of the steamers approaching and leaving the quays, and can readily be removed under shelter by dredging.

**Entrances to Harbours.**—Though captains of vessels always wish for wide entrances to harbours as affording greater facility of safe access, it is important to keep the width as narrow as practicable, consistent with easy access, to exclude waves and swell as much as possible, and secure tranquillity inside. Dredging with 550 ft. proved excessive for the great exposure of the entrance and moderate size of the harbour, which does not allow of the adequate expansion of the entering swell. Where an adequately easy and safe approach can be secured, it is advantageous to make the entrance face a somewhat sheltered quarter by the overlapping of the end of one of the breakwaters, as accomplished at Bilbao and Genoa harbours (fig. 3), and at the southern entrance to Dover harbour. Occasionally, owing to the comparative shelter afforded by a bend in the adjacent coast, a breakwater may be extended round a breakwater and the sea; typical examples are furnished by the former open northern entrance to Portland harbour, now closed against torpedoes, and the wide entrances at Holyhead and Zeebrugge (fig. 7). With a large harbour and the adoption of a detached breakwater, it is possible to gain the advantage of two entrances facing different quarters, as effected at Dover and Colombo, which enables vessels to select their entrance according to the state of the wind and weather; where there is a large tidal rise they reduce the current through the entrances, and they may, under favourable conditions, create a circulation of the water in the harbour, tending to check the deposit of silt.

**HARBURG,** a seaport town of Germany, in the Prussian province of Hanover, on the left bank of the southern arm of the Elbe, 6 m. by rail S. of Hamburg. Pop. (1885), 26,320; (1905)—the area of the town having been increased since 1895—55,454. It is pleasantly situated at the foot of a lofty range of hills, which here dip down to the river, at the junction of the main lines of railway from Bremen and Hanover to Hamburg, which are carried to the latter city over two grand bridges crossing the southern and the northern arms of the Elbe. It possesses a Roman Catholic and two Protestant churches, a palace, which from 1524 to 1642 was the residence of the Harburg line of the house of Brunswick, a high-grade modern school, a commercial school and a theatre. The leading industries are the crushing of palm-kernels and linseed and the manufacture of India-rubber, phosphates, starch, nitrate and jute. Machines are manufactured here; beer is brewed, and shipbuilding is carried on. The port is accessible to vessels drawing 18 ft. of water, and, despite its proximity to Hamburg, its trade has of late years shown a remarkable development. It is the chief mart in the empire for resin and palm-oil. The Prussian government proposes establishing here a free port, on the lines of the Freihafen in Hamburg.

Harburg belonged originally to the bishopric of Bremen, and received municipal rights in 1207. In 1376 it was united to the principality of Lüneburg, along with which it fell in 1705 to Hanover, and in 1806 to Prussia. In 1813 and 1814 it suffered considerably from the French, who then held Hamburg, and who built a bridge between the two towns, which remained standing till 1816.

See Ludewig, Geschichte des Schlosses und der Stadt Harburg (1845); and Hofmeyer, Harburg und die nächste Umgebung (1885).

**HARCOURT,** a village in Normandy, now a commune in the department of Eure, arrondissement of Bernay and canton of Brionne, which gives its name to a noble family distinguished in French history, a branch of which was early established in England. Of the lords of Harcourt, whose genealogy can be traced back to the 12th century, the first to distinguish himself was Jean II. (d. 1362) who was marshal and admiral of France. Godefroi d’Harcourt, seigneur of Saint Sauveur le Vicomte, surnamed "Le boiteux" (the lame), was a marshal in the English army and was killed near Coutances in 1356. The fief of Harcourt was raised to the rank of a county by Philip of Valois, in favour of Jean IV., who was killed at the battle of Crecy (1346). His son, Jean V. (d. 1355) married Blanche, heiress of Jean II., count of Aumale, and the countyship of Harcourt passed with that of Aumale until, in 1424, Jean VIII., count of Aumale and Harcourt, and Henri III., count of Harcourt, were stabbed in the battle of Verneuil, and with him the elder branch became extinct in the male line. The heiress, Marie, by her marriage with Anthony of Lorraine, count of Vaudémont, brought the countyship of Harcourt into the house of Lorraine. The title of count of Harcourt was borne by several princes of this house. The most famous instance was Henry of Lorraine, count of Harcourt, Brionne, and Armagnac, and nicknamed "Cadet la perle" (1601–1666). He distinguished himself in several campaigns against Spain, and later played an active part in the civil wars of the Fronde. He took the side of the princes, and fought against the
HARCOURT, 1ST VISCOUNT—HARCOURT, SIR WILLIAM

government in Alsace; but was defeated by Marshal de la Ferté, and made his submission in 1654.

The most distinguished among the younger branches of the family are those of Montgomery and of Beuvron. To the former belonged Jean d’Harcourt, bishop of Amiens and Tournai, archbishop of Narbonne and patron of Antioch, who died in 1452; and Guillaume d’Harcourt, count of Tancarville, and viscount of Melun, who was head of the administration of the woods and forests in the royal domain (souverain maître et réformateur des eaux et forêts de France) and died in 1487.

From the branch of the marquis of Beuvron sprang Henri d’Harcourt, marshal of France, and ambassador at the Spanish court, who was made duke of Harcourt (1700) and a peer of France (1709); also François Eugène Gabriel, count, and afterwards duke, of Harcourt, who was ambassador first in Spain, and later in Rome, and died in 1865. This branch of the family is still in existence.

HARCOURT, SIMON HARCOURT, 1ST VISCOUNT (c. 1661–1727), lord chancellor of England, only son of Sir Philip Harcourt of Stanton Harcourt, Oxfordshire, by his first wife, Anne, daughter of Sir William Waller, was born about 1661 at Stanton Harcourt, and was educated at a school at Shilton, Oxfordshire, and at Pembroke College, Oxford. He was called to the bar in 1685, and soon afterwards was appointed reporter of Abingdon, which borough he represented as a Tory in the Parliament of 1690 to 1705. In 1701 he was nominated by the Commons to conduct the impeachment of Lord Somers; and in 1702 he became solicitor-general and was knighted by Queen Anne. He was elected member for Bossiney in 1705, and as commissioner for arranging the union with Scotland was largely instrumental in promoting that measure. Harcourt was appointed attorney-general in 1707, but resigned office in the following year when his friend Robert Harley, afterwards earl of Oxford, was dismissed. He defended Sacheverell at the bar of the House of Lords in 1710, being then without a seat in parliament; but in the same year was returned for Cardigan, and in September again became attorney-general. In October he was appointed lord keeper of the great seal, and in virtue of this office he presided in the House of Lords for some months without a peerage, until, on the 3rd of September 1711, he was created Baron Harcourt of Stanton Harcourt; but it was not till April 1713 that he received the appointment of lord chancellor. In 1710 he had purchased the Nuneham-Courtenay estate in Oxfordshire, but his usual place of residence continued to be at Coke-thorpe, and he continued to be regarded as a member of the gentry, and was visited in state from Queen Anne. In the negotiations preceding the peace of Utrecht, Harcourt took an important part. There is no sufficient evidence for the allegations of the Whigs that Harcourt entered into reasonable relations with the Pretender. On the accession of George I. he was deprived of office and retired to Cokethorpe, where he enjoyed the society of men of letters, Swift, Pope, Prior and other famous writers being among his frequent guests. With Swift, however, he had occasional quarrels, during one of which the great satirist bestowed on him the sobriquet of "Trimming Harcourt." He exerted himself to defeat the impeachment of Lord Oxford in 1717, and in 1719, he was active in obtaining a pardon for another old political friend, Lord Bolingbroke. In 1721 Harcourt was created a viscount and returned to the privy councils; and on several occasions during the King’s absences from England he was on the council of regency. He died in London on the 23rd of July 1727. Harcourt was not a great lawyer, but he enjoyed the reputation of being a brilliant orator; Speaker Onslow going so far as to say that Harcourt "had the greatest skill and power of speech of any man I ever knew in a public assembly." He was a member of the famous Saturday Club, frequented by the chief intellects and wits of the period, with several of whom he corresponded. Some letters to him from Pope are preserved in the Harcourt Papers. His portrait by Kneller is at Nuneham.

Harcourt married, first, Rebecca, daughter of Thomas Clark, his father’s chaplain, by whom he had five children; secondly, Elizabeth, daughter of Richard Spencer; and thirdly, Elizabeth, daughter of Sir Thomas Vernon. He left issue by his first wife only. His son, Simon (1684–1720), married Elizabeth, sister of Sir John Evelyn of Wotton, by whom he had one son and four daughters, one of whom married George Venables Vernon, afterwards Lord Vernon (see Harcourt, Sir William, note). Simon Harcourt predeceased his father, the lord chancellor, in 1720, leaving a son Simon Harcourt (1714–1777), 1st Earl Harcourt, who succeeded his grandfather in the title of viscount in 1727. He was educated at Westminster school. In 1745, having raised a regiment, he received a commission as a colonel in the army; and in 1749 he was created Earl Harcourt of Stanton Harcourt. He was appointed governor to the prince of Wales, afterwards George III., in 1751; and after the accession of the latter to the throne he was appointed, in 1761, special ambassador to Mecklenburg-Schwerin; the important marriage between King George and the princess Charlotte, whom he conducted to England. After holding a number of appointments at court and in the diplomatic service, he was promoted to the rank of general in 1772; and in October of the same year he succeeded Lord Townsend as lieutenant of Ireland, an office which he held till 1777. His proposal to impose a tax of 10% on the rents of absentee landlords had to be abandoned owing to opposition in England; but he succeeded in conciliating the leaders of Opposition in Ireland, and he persuaded Henry Flood to accept a motion for the impeachment of the Duke of Dorset, the Earl of Dartmouth and Hardwicke, &c., Oxford, 1833); Earl Stanhope, Hist. of England, comprising the reign of Queen Anne until the Peace of Utrecht (London, 1870). In addition to the above-mentioned authorities many particular accounts of the 1st Viscount Harcourt, and also of his grandson, the 1st earl, will be found in the Harcourt Papers. For the earl, see also Horace Walpole, Memoirs of the Reign of George III. (4 vols., London, 1845, 1846); also, for his vice-royalty of Ireland, see Henry Grattan, Memoirs of the Life and Times of the Right Hon. H. Grattan (5 vols., London, 1839–1846); Frederick Hervey, Viscount Townshend, Memoirs of the Reign of George III. (2 vols., London, 1812); and for his genealogy, see Sir John Bernard Burke, Genealogical History of Dormant and Extinct Peerages (London, 1850). (R. J. M.)

HARCOURT, SIR WILLIAM GEORGE GRANVILLE VENABLES VERNON (1827–1904), English statesman, second son of the Rev. Canon William Vernon Harcourt (q.v.), of Nuneham Park, Oxford, was born on the 14th of October 1827. Canon Harcourt was the fourth son and eventually heir of Edward Harcourt (1757–1847), archbishop of York, who was the son of the 1st Lord Vernon (d. 1780), and who took the name of Harcourt alone instead of Vernon on succeeding to the property of his cousin, the last Earl Harcourt, in 1831.1 The subject

1 William, 3rd and last Earl Harcourt (1743–1830), who succeeded his brother in the title, was a soldier who distinguished himself in the American War of Independence by capturing General Charles Lee, and commanded the British forces in Flanders in 1794, eventually becoming a field-marshall. He was a son of Simon, 1st earl (1721–1777), created viscount and earl in 1749, a soldier, and from 1777 to 1777 viceroys of Ireland, who was succeeded by his son, the 2nd Viscount Harcourt (1661–1727), lord chancellor—the "trimming Harcourt" of Swift—the purchaser of the Nuneham-Courtenay estate in Oxfordshire, and grandfather of the 1st Earl Harcourt and of the 1st Viscount Harcourt. The knights of Stanton Harcourt, from the 13th century onwards, traced their descent to the Norman de Harcourt, a branch of that family having come over with the Conqueror; and according to the same clear title, in 1196, Gervase, 5th earl, received the lordships of Harcourt, Castlelye and Beaumé in Normandy. Viscount Harcourt’s second son, Simon, who was father of the 1st earl, was also father of Martha, who married George

(10.1001/jama.1873.01700140033022)
of this biography was therefore born a Vernon, and by his connexion with the old families of Vernon and Harcourt was related to many of the great English houses, a fact which gave him no little pride. Indeed, in later life his descent from the Plantagenets was a subject of some bane to the part of his political opponents. He was educated at Trinity College, Cambridge, graduating with first-class honours in the classical tripos in 1851. He was called to the bar in 1854, became a Q.C. in 1860, and was appointed Whewell professor of international law, Cambridge, 1869. He quickly made his mark in London society as a brilliant talker; he contributed regularly to the Saturday Review, and wrote some famous letters (1862) to The Times over the signature of "Historicus," in opposition to the recognition of the Southern States as belligerents in the American Civil War. He entered parliament as Liberal member for Oxford, and sat from 1868 to 1880, when, upon seeking re-election after acceptance of office, he was defeated by Mr. Hall. A seat was, however, found for him at Derby, by the voluntary retirement of Mr. Plimsoll, and he continued to represent that constituency until 1895, when, having been defeated at the general election, he found a seat in West Monmouthshire. He was appointed solicitor-general and knighted in 1873; and, although he had not shown himself a very strenuous supporter of Mr. Gladstone during that statesman's exclusion from power, he became secretary of state for the home department on the return of the Liberals to office in 1880. His name was connected at that time with the passing of the Ground Game Act (1880), the Arms (Ireland) Act (1881), and the Explosives Act (1883). As home secretary at the time of the dynamite outrages he had to take up a firm attitude, and the Explosives Act was passed through all its stages in the shortest time on record. Moreover, as champion of law and order against the attacks of the Parnellites, his vigorous speeches brought him constantly into conflict with the Irish members. In 1884 he introduced an abortive bill for unifying the municipal administration of London. He was indeed at that time recognized as one of the ablest and most effective leaders of the Liberal party; and when, after a brief interval in 1885, Mr. Gladstone returned to office in 1886, he was made chancellor of the exchequer, an office which he again filled from 1892 to 1895.

Between 1880 and 1892 Sir William Harcourt acted as Mr. Gladstone's loyal and indefatigable lieutenant in political life. A first-rate party fighter, his services were of inestimable value; but in spite of his great success as a platform speaker, he was generally felt to be speaking from an advocate's brief, and did not impress the country as possessing much depth of conviction. It was he who coined the phrase about "stewing in Parnellite juice," and, when the split came in the Liberal party on the Irish question, even those who gave Mr. Gladstone and Mr. Morley the credit of being convinced Home Rulers could not be persuaded that Sir William had followed any but the line of party expediency. In 1894 he introduced and carried a memorable budget, which equalized the death duties on real and personal property. After Mr. Gladstone's retirement in 1894 and Lord Rosebery's selection as prime minister Sir William became the leader of the Liberal party in the House of Commons, but it was never probable that he would work comfortably in the new conditions. His title to be regarded as Mr. Gladstone's successor had been too lightly ignored, and from the first it was evident that Lord Rosebery's ideas of Liberalism and of the policy of the Liberal party were not those of Sir William Harcourt. Their differences were patched up from time to time, but the Vennables Vernon, of Sudbury, created 1st Baron Vernon in 1752. The latter was a descendant of Sir Richard Vernon (d. 1451), speaker of the Leicester parliament (1425) and treasurer of Calais, a member of a Norman family which came over with the Conqueror. In The History of the Vernon Family (see above) (see above), by the marquis of Ruvigny, 1903, for tables, could be traced through Lady Anna Leveson Gower (wife of Archbishop Harcourt) to Lady Frances Stanley, "lady of the 1st earl of Bridgewater (1570-1549), and so to Lady Eleanor Brandon, wife of the 2nd earl of Cumberland (1517-1570), and daughter of Mary Tudor (wife of Charles Brandon, duke of Suffolk, 1484-1545), the daughter of Henry VII. and grand-daughter of Edward IV.

combination could not last. At the general election of 1895 it was clear that there were divisions as to what issue the Liberals were fighting for, and the effect of Sir William Harcourt's abortive Local Veto Bill on the election was seen not only in his defeat at Derby, which gave the signal for the Liberal rout, but in the set-back it gave to temperance legislation. Though returned for West Monmouthshire (1895, 1900), his speeches in debate only occasionally showed his characteristic spirit, and it was evident that for the hard work of Opposition he no longer had the same motive as of old. In December 1898 the crisis arrived, and with Mr. John Morley he definitely retired from the counsels of the party and resigned his leadership of the Opposition, alleging as his reason, in letters exchanged between Mr. Morley and himself, the cross-currents of opinion among his old supporters and former colleagues. The split excited considerable comment, and resulted in much heart-burning and a more or less open division between the section of the Liberal party following Lord Rosebery (q.v.) and those who disliked that statesman's Imperialistic views.

Though now a private member, Sir William Harcourt still continued to vindicate his opinions in his independent position, and his attacks on the government were no longer restrained by even the semblance of deference to Liberal Imperialism. He actively intervened in 1890 and 1900, strongly condemning the government's financial policy and their attitude towards the Transvaal; and throughout the Boer War he lost no opportunity of criticizing the South African developments in a pessimistic vein. One of the readiest parliamentary debaters, he savoured his speeches with humour of that broad and familiar order which appeals particularly to political audiences. In 1898-1900 he was conspicuous, both on the platform and in letters written to The Times, in demanding active measures against the Ritualistic party in the Church of England; but his attitude on that subject could not be dissociated from his political advocacy of Disestablishment. In March 1904, just after he had announced his intention not to seek election again to parliament, he succeeded, by the death of his nephew, to the family estates at Nunecham. But he died suddenly there in the 1st of October in the same year. He married, first, in 1859, Thérèse (d. 1863), daughter of Mr. T. H. Lister, by whom he had one son, Lewis Vernon Harcourt (b. 1863), afterwards first commissioner of works both in Sir Henry Campbell-Bannerman's 1905 ministry (included in the cabinet in 1907) and in Mr. Asquith's cabinet (1908); and secondly, in 1876, Elizabeth, widow of Mr. T. Ives and daughter of Mr. J. L. Motley, the historian, by whom he had another son, Robert (b. 1878).

Sir William Harcourt was one of the great parliamentary figures of the Gladstonian Liberal period. He was essentially an aristocratic type of late 19th century Whig, with a remarkable capacity for popular campaign fighting. He had been, and remained, Sir William SIP as a brilliant Whig debater. He was one of those who really made the Saturday Review in its palmy days, and in the period of his most ebulient vigour, while Mr Gladstone was alive, his sense of political expediency and platform effectiveness in controversy was very acute. But though he played the game of public life with keen zest, he never really touched either the country or his own party with the faith which creates a personal following, and in later years he found himself somewhat isolated and disappointed, though he was free to express his deeper objections to the new developments in church and state. A tall, fine man, with the grand manner, he was, throughout a long career, a great personality in the life of his time.

HARCOURT, WILLIAM VERNON (1789-1871), founder of the British Association, was born at Sudbury, Derbyshire, in 1789, a younger son of Edward Vernon [Harcourt], archbishop of York (see above). Having served for five years in the navy he went up to Christ Church, Oxford, with a view to taking holy orders. He began his clerical duties at Bishopthorpe, Yorkshire, in 1811, and having developed a great interest in science while at the university, he took an active part in the foundation of the Yorkshire Philosophical Society, of which he
was the first president. The laws and the plan of proceedings for the British Association for the Advancement of Science were drawn up by him; and Harcourt was elected president in 1830. In 1832, he became canon of York and rector of Wheldrake in Yorkshire, and in 1837 rector of Bolton Percy. The Yorkshire school for the blind and the Castle Howard reformatory both owe their existence to his energies. His spare time until quite late in life was occupied with scientific experiments. Inheriting the Harcourt estates in Oxfordshire from his brother in 1801, he removed to Nuneham, where he died in April 1871.

HARDANGER FJORD, an inlet on the west coast of Norway; penetrating the mainland for 70 m. apart from the deep fringe of islands, Pola, which form the coastal distance from the open water to the head of the fjord being 114 m. Its extreme depth is about 350 fathoms. The entrance at Torb is 50 m. by water south of Bergen, 60° N., and the general direction is N.E. from that point. The fjord is flanked by magnificent mountains, from which many waterfalls pour into it. The main fjord is divided into parts under different names, and there are many fine branch fjords. The fjord is frequented by tourists, and the principal stations have hotels. The outer fjord is called the Kvinnedredsfjord, flanked by the Melderskin (4680 ft.); then follow the Møre and the Utnefjord. Here Mulfjord opens on the east; from Sundal on this inlet the great Folgefond snowfield may be crossed, and a fine glacier (Bondhusbreae) visited. Bakke and Vikingea are stations on Hisfjord, Norheimsund and Østensø on Ytre Samlen, which throws off a fine narrow branch northward, the Fiskensund. There follow Indre Samlen and Utnefjord, with the station of Utne opposite Oxen (4120 ft.), and its northward branch, Gravenfjord, with the beautiful station of Eide at its head, whence a road runs north-west to Vossevangen. From the Utne terminal branches of the fjord run south and east; the Sørfjord, steeply walled by the heights of the Folgefond, with the frequented resort of Odde at its head; and the Eidfjord, with its branch Osafjord, terminating beneath a rampart of mountains, through which the sombre Simodal penetrates, the river flowing from Daemnevand, a beautiful lake among the fields, and forming with its tributaries the fine falls of Skykje and Rembesdal. Vik is the principal station on Eidfjord, and Ulvik on a branch of the Ose, with a road to Vossevangen. At Vik is the mouth of the Bjørelia river, which, in forming the Voringfoss, plunges 520 ft. into a magnificent rock-bound basin. A small stream entering Sørfjord forms in its upper course the Skjæggedalsløf, of equal height with the Voringfoss, and hardly less beautiful. The natives of Hardanger have an especially picturesque costume.

HARDEE, WILLIAM JOSEPH (1815–1873), American soldier, was born in Savannah, Georgia, on the 10th of November 1815 and graduated from West Point in 1838. As a subaltern of cavalry he was employed on a special mission to Europe to study the cavalry methods in vogue (1839). He was promoted captain in 1844 and served under Generals Taylor and Scott in the Mexican War, winning the brevet of major for gallantry in action in March 1847 and subsequently that of lieutenant-colonel. After the war he served as a substantive major under Colonels Sidney Johnston and Lieut.-Colonel Robert Lee in the 2nd U.S. cavalry, and for some time before 1856 he was engaged in compiling the official manual of infantry drill and tactics which, familiarly called "Hardee's Tactics," afterwards formed the text-book for the infantry arm in both the Federal and the Confederate armies. From 1856 to 1861 he was commandant of West Point, resigning his commission on the secession of his state in the latter year. Entering the Confederate service as a colonel, he was shortly promoted brigadier-general. He distinguished himself very greatly by his tactical leadership on the field of Shiloh, and was immediately promoted major-general. As a corps commander he fought under General Bragg at Perryville and Stone River, and for his distinguished services in these battles was promoted lieutenant-general. He served in the latter part of the campaign of 1863 under Bragg and in that of 1864 under J. E. Johnston. When the latter officer was superseded by Hood, Hardee was relieved at his own request, and for the remainder of the war he served in the Carolinas. When the Civil War came to an end in 1865 he retired to his plantation near Selma, Alabama. He died at Wytheville, Virginia, on the 6th of November 1873.

HARDENBERG, KARL AUGUST VON, PRINCE (1750–1822), Prussian statesman, was born at Essenroda in Hanover on the 31st of May 1750. After studying at Leipzig and Göttingen he entered the Hanoverian civil service in 1770 as councillor of the board of domains (Kammerrat); but, finding his advancement slow, he set out—on the advice of King George III.—on a course of travels, spending some time at Wetzlar, Regensburg with the Elector Leopold (then the Emperor), and Vienna and Bedin. He also visited France, Holland and England, where he was kindly received by the king. On his return he married, by his father's desire, the countess Reventlow. In 1778 he was raised to the rank of privy councillor and created a count. He now again went to England, in the hope of obtaining the post of Hanoverian envoy in London; but, his wife becoming entangled in an amour with the prince of Wales, so great a scandal was created that he was forced to leave the Hanoverian service. In 1782 he entered that of the duke of Brunswick, who, on the death of his brother, in 1786, became ruler of the principality of Hanover. This service he continued in, in the manner approved by the enlightened despotism of the century, that rendered him very unpopular with the orthodox clergy and the conservative estates. In Brunswick, too, his position was in the end made untenable by the conduct of his wife, whom he now divorced; he himself, shortly afterwards, marrying a divorced woman. Fortunately for him, this coincided with the lapsing of the principalities of Ansbach and Bayreuth to Prussia, owing to the resignation of the last margrave, Charles Alexander, in 1791. Hardenberg, who happened to be in Berlin at the time, was on the recommendation of Herzberg appointed administrator of the principalities (1792). The position, owing to the singular overlapping of territorial claims in the old Empire, was one of considerable delicacy, and Hardenberg filled it with great skill, doing much to reform traditional anomalies and to develop the country, and at the same time labours to expounding the influence of Prussia in South Germany. After the outbreak of the revolutionary wars his diplomatic ability led to his appointment as Prussian envoy, with a roving commission to visit the Rhenish courts and win them over to Prussia's views; and ultimately, when the necessity for making peace with the French Republic had been recognized, he was appointed to succeed Count Goltz as Prussian plenipotentiary at Basel (February 28, 1795), where he signed the treaty of peace.

In 1797, on the accession of King Frederick William III., Hardenberg was summoned to Berlin, where he received an important position in the cabinet and was appointed chief of the departments of Magdeburg and Halberstadt, for Westphalia, and for the principality of Neuchâtel. In 1793 Hardenberg had struck up a friendship with Count Haugwitz, the influential minister for foreign affairs, and when in 1803 the latter went away on leave (August-October) he appointed Hardenberg his locum tenens. It was a critical period. Napoleon had just occupied Hanover, and Haugwitz had urged upon the king the necessity for strong measures and the expediency of a Russian alliance. During his absence, however, the king's irresolution continued; he clung to the policy of neutrality which had so far seemed to have served Prussia so well; and Hardenberg contented himself with adapting himself to the royal will. By the time Haugwitz returned, the unyielding attitude of Napoleon had caused the king to make advances to Russia; but the mutual declarations of the 3rd and 25th of May 1804 only pledged the two powers to take up arms in the event of a French attack upon Prussia or of further aggressions in North Germany. Finally, Haugwitz, unable to persuade the cabinet to a more vigorous policy, resigned, and on the 14th of April 1804 Hardenberg succeeded him as foreign minister.

If there was to be war, Hardenberg would have preferred the French alliance, which was the price Napoleon demanded for the cession of Hanover to Prussia; for the Eastern powers would
HARDERWYK—HARDING, C.

loosely-knit Prussian monarch, but partly in Hardenberg's character, which, never well balanced, had deteriorated with age. He continued amiable, charming and enlightened as ever; but the excesses which had been pardonable in a young diplomatist were a scandal in an elderly chancellor, and could not but weaken his influence with so pious a Landesvater as Frederick William III. To overcome the king's terror of Liberal experiments would have needed all the powers of an adviser at once wise and in character wholly trustworthy. Hardenberg was wise enough; he saw the necessity for constitutional reform; but he clung with almost saintly tenacity to the sweets of office, and when the tide turned strongly against Liberalism he allowed himself to drift with it. In the privacy of royal commissions he continued to elaborate schemes for constitutions that never saw the light; but Germany, disillusioned, saw only the faithful henchman of Metternich, an accomplice in the policy of the Carlsbad Decrees and the Trippau Protocol. He died, soon after the closing of the congress of Verona, at Genoa, on the 26th of November 1822.

HARDACNUTE [more correctly HARDACNUT] (c. 1019-1042), son of Canute, king of England, by his wife Ælfgifu or Emma, was born about 1020. In the contest for the English crown which followed the death of Canute in 1035 the claims of Hardacnut were supported by Emma and her ally, Godwine, earl of the West Saxons, in opposition to those of Harold, Canute's illegitimate son, who was backed by the Mercian earl Leofric and the chief men of the north. At a meeting of the witan at Oxford a compromise was ultimately arranged by which Harold was temporarily elected regent of all England, pending the final settlement of the question on the return of Hardacnut from Denmark. He could not oppose Godwine and Emma, who for a time forcibly held Wessex in Hardacnut's behalf. But Harold's party rapidly increased; and early in 1037 he was definitely elected king. Emma was driven out and took refuge at Bruges. In 1039 Hardacnut joined her, and together they concerted an attack on England. But next year Harold died; and Hardacnut peacefully succeeded. His short reign was marked by great oppression and cruelty. He caused the dead body of Harold to be dug up and thrown into a fen; he exacted so heavy a geld for the support of his foreign fleet that great discontent was created throughout the kingdom, and in Worcestershire a general uprising took place against those sent to collect the tax, whereupon he burned the city of Worcester to the ground and devastated the surrounding country; in 1042 he permitted Edwulf, earl of Northumbria, to be treacherously murdered after having granted him a safe-conduct. While "he stood at his drink" at the marriage feast of one of his fiefs he was suddenly seized with a fit, from which he died a few days afterwards on the 8th of June 1042.

HARDING, CHESTER (1792-1866), American portrait painter, was born at Conway, Massachusetts, on the 1st of September 1792. Brought up in the wilderness of New York state, Harding,
as a lad of splendid physique, standing over 6 ft. 3 in., marched as a drummer with the militia to the St Lawrence in 1813. He became subsequently chairma...Amongst the conduct of Wellington’s principles—a system not altogether suited to the changed mode of warfare. In 1855 he was promoted to the rank of field marshal. Viscount Hardinge resigned his office of commander-in-chief in July 1856, owing to failing health, and died on the 24th of September of the same year at South Park near Tunbridge Wells. His elder son, Charles Stewart (1822–1854), who had been his private secretary in India, was the 2nd Viscount Hardinge; and the latter’s eldest son succeeded to this title. The younger son of the 2nd Viscount, Charles Hardinge, 3rd Viscount (1828–1903), was a diplomatist (see Edward VII), and was appointed governor-general of India in 1910, being created Baron Hardinge of Penshurst.

HARDOI, a town and district of British India, in the Lucknow division of the United Provinces. The town is 63 m. N.E. of Lucknow by rail. Pop. (1901) 12,174. It has a wood-carving industry, salt-petre works, and an export trade in grain.

The District of Hassooi has an area of 2,731 sq. m. It is a level, sandy, waterless tract, and is intersected by the rivers Gumti and Haro. The Hardoi, Hassooi, and Gilose are the three rivers first named being navigable by country boats. Towards the Ganges the land is uneven, and often rises in hillocks of sand cultivated at the base, and their slopes covered with lofty mung grass. Several large jhils or swamps are scattered throughout the district, the largest being that of Sändig, which is 3 m. long by from 1 to 2 m. broad. These jhils are largely used for irrigation. Large tracts of forest jungle still exist. Leopards, black buck, spotted deer, and nilgai are common; the mallard, teal, grey duck, common goose, and all kinds of waterfowl abound. In 1901 the population of the district was 1,902,834, showing a decrease of nearly 2% in the decade. The district contains a larger urban population than any other in Oudh, the largest town being Shahabad, 20,036 in 1901. It is traversed by the Oudh and Rohilkhand railway from Lucknow to Shahjahanpur, and its branches. The chief exports are grain, sugar, hides, tobacco and salt-petre.

The first authentic records of Hardoi are connected with the Mussulman colonization. Bāwan was occupied by Suyyid Sīlar Masā'īd in 1618, but the permanent Mussulman occupation did not begin till 1617. Owing to the situation of the district, Hardoi formed the scene of many sanguinary battles between the rival Afghan and Mogul empires. Between Bilgrām and Sāndi was fought the great battle between Humāyūn and Sher Shāh, in which the former was utterly defeated. Hardoi, along with the rest of Oudh, became British territory under Lord Dalhousie’s proclamation of February 1856.

HARDOuin, J. D.—HARDOUN, Jean (1661–1729), French classical scholar, was born at Quimper in Brittany. Having acquired a taste for literature in his father’s book-shop, he sought and obtained about his sixteenth year admission into the Order of the Jesuits. In Paris, where he went to study theology, he ultimately became librarian of the Collège Louis le Grand in 1683, and he died there on the 3rd of September 1729. His first published work was an edition of Themistius (1684), which included no fewer than thirteen new orations. On the advice of Jean Garnier (1612–1651) he undertook to edit the Natural History of Pliny for the Delphine series, a task which he completed in five years. His attention having been turned to numismatics as auxiliary to his great editorial labours, he published several learned works in that department, most of which, however, were unaccompanied by the did was marred, by a determination to be at all hazards different from other interpreters. It is sufficient to mention his Nummi antiqui populi Romani urbis illustrati (1684), Antiquitatem de nummis antiquis coloniarum et municipiorum (1685), and Chronologia Vetus Testamenti ad vulgatam versionem exacta et nummis illustrata (1696). By the ecclesiastical authorities Hardouin was appointed to supervise the Conciliorum collectio regia maxima

HARDT—HARDWICKE, LORD

(1715); but he was accused of suppressing important documents and foisting in apocryphal matter, and by the order of the parlement of Paris (then at war with the Jesuits) the publication of the work was delayed. It is really a valuable collection, much cited by scholars. Hardouin declared that all the councils supposed to have taken place before the council of Trent were fictitious. It is, however, as the originator of a variety of paradoxical theories that Hardouin is now best remembered. The most remarkable, contained in his Chronologiae ex nummis antiquis restitutae (1660) and Prolegomena ad censuram verum scriptorum, was to the effect that, with the exception of the works of Homer, Herodotus and Cicero, the Natural History of Pliny, the Georgics of Virgil, and the Satires and Epistles of Horace, all the ancient classics of Greece and Rome were spurious, having been manufactured by monks of the 13th century, under the direction of a certain Severus Archontius. He denied the genuineness of most ancient works of art, coins and inscriptions, and declared that the New Testament was originally written in Latin.

See A. Debacker, Bibliothèque des écrivains de la Compagnie de Jésus (1853).

HARDT, HERMANN VON DER (1660–1746), German historian and orientalist, was born at Melle, in Westphalia, on the 15th of November 1660. He studied oriental languages in Jena and in Leipzig, and in 1690 he was called to the chair of oriental languages at Helmstedt. He resigned his position in 1727, but lived at Helmstedt until his death on the 28th of February 1746. Among his numerous writings the following deserve mention: Autographa Lutheri altiorumque celebrarium virorum, ab anno 1517 ad annum 1546, Reformationis atatem et historian regere illustrantia (1690–1701); Magnum occunenium Constantiense concilium (1697–1700) Hebraeae linguae fundamenta (1674); Syriacae linguae fundamenta (1674); Elementa Chaldaica (1663); Historia litteraria reformationis (1717); Enigmata prisci orbi (1723). Hardt left in manuscript a history of the Reformation which is preserved in the Helmstedt Juleum.

HARDT, THE, a mountainous district of Germany, in the Bavarian palatinate, forming the northern end of the Voges range. It is, in the main, an undulating high plateau of sandstone formation, of a mean elevation of 1300 ft., and reaching its highest point in the Donnersberg (2254 ft.). The eastern slope, which descends gently towards the Rhine, is diversified by deep and well-wooded valleys, such as those of the Lauter and the Queich, and by conical hills surmounted by the ruins of frequent feudal castles and monasteries. Noticeable among these are the Madenburg near Eschbach, the Trifels (long the dungeon of Richard I. of England), and the Maxburg near Neustadt. Three-fifths of the whole area is occupied by forests, principally oak, high land, and fine pasturage. The eastern slope is highly cultivated and produces excellent wine.

HARDWAR, or HURDWAR, an ancient town of British India, and Hindu place of pilgrimage, in the Saharanpur district of the United Provinces, on the right bank of the Ganges, 17 m. N.E. of Kurki, with a railway station. The Ganges canal here takes off from the river. A branch railway to Dehra was opened in 1900. Pop. (1901), 25,597. The town is of great antiquity, and has borne many names. It was originally known as Kapila from the image of Kapila. Hsuan Tsang, the Chinese Buddhist pilgrim, in the 7th century visited a city which he calls Mo-yu-lo, the remains of which still exist at Mayapuri, a little to the south of the modern town. Among the ruins are a fort and three temples, decorated with broken stone sculptures. The great object of attraction at present is the Hari-ka-charan, or bathing ghâi, with the adjoining temple of Gangadwara. The Charan or foot-mark of Vishnu, imprinted on a stone, lies on the bank where the divine feet, every year, a feast of peculiar sanctity occurs, known as a Kumbh-mela. The ordinary number of pilgrims at the annual fair amounts to 100,000, and at the Kumbh-mela to 300,000; in 1903 there were 400,000 present. Since 1892 many sanitary improvements have been made for the benefit of the annual concourse of pilgrims. In early days riots and outbreaks of cholera were of common occurrence. The Hardwar meeting also possesses mercantile importance, being one of the principal horse-fairs in Upper India. Commodities of all kinds, Indian and European, find a ready sale, and the trade in grain and food-stuffs forms a lucrative traffic.

HARDWICKE, PHILIP YORKE, 1st EARL OF (1660–1764), English first chancellor, son of Philip Yorke, an attorney, was born at Dover, Kent, on 21st of December 1660. Through his mother, Elizabeth, daughter and co-heiress of Richard Gough of Rolvenden, Kent, he was connected with the family of Gibbon the historian. At the age of fourteen, after a not very thorough education at a private school at Bethnal Green, where, however, he showed exceptional promise, he entered an attorney’s office in London. Here he gave some attention to literature and the classics as well as to law; but in the latter he made such progress that his employer, Salkeid, impressed by Yorke’s powers, entered him at Lincoln’s Inn. In 1708, and afterwards recommended him to Lord Chief Justice Parker (a relative of Macclesfield) as law tutor to his sons. In 1715 he was called to the bar, where his progress was, says Lord Campbell, “more rapid than that of any other débutant in the annals of our profession,” his advancement being greatly furthered by the patronage of Macclesfield, who became lord chancellor in 1718, when Yorke transferred his practice from the king’s bench to the court of chancery, though he continued to go on the western circuit. In the following year he established his reputation as an equity lawyer in a case in which Sir Robert Walpole’s family was interested, by an argument displaying profound learning and research concerning the jurisdiction of the chancellor, on lines which he afterwards more fully developed in a celebrated letter to Lord Kames on the distinction between law and equity. Through Macclesfield’s influence with the duke of Newcastle Yorke entered parliament in 1719 as member for Lewes, and was appointed solicitor-general, with a knighthood, in 1720, although he was then a barrister of only four years’ standing. His conduct of the prosecution of Christopher Layer in that year for treason as a Jacobite further raised Sir Philip Yorke’s reputation as a forensic orator; and in 1723, having already become attorney-general, he passed through the House of Commons the bill of pains and penalties against Bishop Atterbury. He was excused, on the ground of his personal friendship, from acting for the crown in the impeachment of Macclesfield in 1725, though he did not exert himself to save his patron from disgrace largely brought about by Macclesfield’s partiality for Yorke himself. He soon found a new and still more influential patron in the duke of Newcastle, to whom he henceforth gave his political support. He rendered valuable service to Walpole’s government by his support of the bill for prohibiting loans to foreign powers (1730), of the increase of the army (1732) and of the excise bill (1733). In 1733 Yorke was appointed lord chief justice of the king’s bench, with the title of Lord Hardwicke, and was sworn of the privy council; and in 1737 he succeeded Talbot as lord chancellor, thus becoming a member of Sir Robert Walpole’s cabinet. One of his first official acts was to deprive the poet Thomson of a small office conferred on him by Talbot.

Hardwicke’s political importance was greatly increased by his removal to the House of Lords, where the incompetency of Newcastle threw on the chancellor the duty of defending the measures of the government. He resisted Carteret’s motion to reduce the army in 1738, and the resolutions hostile to Spain over the affair of Captain Jenkins’s ears. But when Walpole bent before the storm and declared war against Spain, Hardwicke advocated energetic measures for its conduct; and he tried to keep the peace between Newcastle and Walpole. There is no sufficient ground for Horace Walpole’s charge that the fall of Sir Robert was brought about by Hardwicke’s treachery. No one was more surprised than himself when he retained the
chancellorship in the following administration, and he resisted
the proposal to indemnify witnesses against Walpole in one of
his finest speeches in May 1742. He exercised a leading influence
in the Wilmington Cabinet; and when Wilmington died in
August 1743, it was Hardwicke who put forward Henry Pelham
for the vacant office against the claims of Pulteney. For many
years from this time he was the controlling power in the govern-
ment. During the king’s absences on the continent Hardwicke
was left at the head of the council of regency; it thus fell to
him to concert measures for dealing with the Jacobite rising
in 1745. He took a just view of the crisis, and his policy for
meeting it was on the whole statesmanlike. After Culloden
he presided at the trial of the Scottish Jacobite peers, his conduct
of which, though judicially impartial, was neither dignified
nor generous; and he must be held partly responsible for the
unnecessary severity meted out to the rebels, and especially
for the cruel, though not illegal, executions on obsolete attainters
of Charles Radcliffe and (in 1755) of Archibald Cameron. He
carried, however, a great reform in 1746, of inestimable benefit
to Scotland, which swept away the grave abuses of feudal power
surviving in that country in the form of private heritable juris-
dictions in the hands of the landed gentry. On the other hand
his legislation in 1748 for disarming the Highlanders and pro-
hibiting the use of the tartan in their dress was vexatious without
being effective. Hardwicke supported Chesterfield’s reform of
the calendar in 1751; in 1753 his bill for legalizing the natural-
ization of Jews in England had to be dropped on account of the
popular clamour it excited; but he successfully carried a salutary
reform of the marriage law, which became the basis of all
subsequent legislation on the subject.

On the death of Pelham in 1754 Hardwicke obtained for
Newcastle the post of prime minister, and for reward was created
earl of Hardwicke and Viscount Royston; and when in
November 1756 the weakness of the ministry and the threatening
aspect of foreign affairs compelled Newcastle to resign, Hard-
wicke retired with him. He played an important and un-
interested part in negotiating the coalition between Newcastle
and Pitt in 1757, when he accepted a seat in Pitt’s cabinet
without returning to the woolpack. After the accession of
George III. Hardwicke opposed the ministry of Lord Bute on
the peace with France in 1762, and on the cider tax in the
following year. In the Wilkes case Hardwicke condemned
general warrants, and also the doctrine that seditious libels
published by members of parliament were protected by parlia-
mentary privilege. He died in London on the 6th of March
1764.

Although for a lengthy period Hardwicke was an influential
minister, he was not a statesman of the first rank. On the other
hand he was one of the greatest judges who ever sat on the English
bench. He did not, indeed, by his three years’ tenure of the chief-
justiceship of the king’s bench leave any impress on the common
law; but Lord Campbell pronounces him “the most consum-
mate judge who ever sat in the court of chancery, being dis-
tinguished not only for his rapid and satisfactory decision of
the causes which came before him, but for the profound and
enlightened principles which he laid down, and for perfecting
English equity into a systematic science.” He held the office
of lord chancellor longer than any of his predecessors, with a
single exception; and the same high authority quoted above
asserts that as an equity judge Lord Hardwicke’s fame “has
not been exceeded by that of any man in ancient or modern times.
His decisions have been, and ever will continue to be, appealed to
as fixing the limits and establishing the principles of the great
jurisdiction system called Equity, which now not only in this
country and in our colonies, but over the whole extent of the
United States of America, regulates property and personal
rights more than the ancient common law.”1 Hardwicke had
prepared himself for this great and enduring service to English
jurisprudence by study of the historical foundations of the
chancellor’s equitable jurisdiction, combined with profound

1 Lord Campbell, Lives of the Lord Chancellors, v. 45 (London,
1846).

insight into legal principle, and a thorough knowledge of the
Roman civil law, the principles of which he scientifically incor-
porated into his administration of English equity in the absence
of precedents bearing on the cases submitted to his judgment.
His decisions on particular points in dispute were based on
general principles, which were neither so wide as to prove in-
applicable to future circumstances, nor too restricted to serve
the purpose of forming a coherent and scientific system. His
recorded judgments—which, as Lord Campbell observes,
“certainly do come up to every idea we can form of judicial
excellence”—combine luminous method of arrangement with
elegance and lucidity of language.

Nor was the creation of modern English equity Lord Hard-
wicke’s only service to the administration of justice. Born
within two years of the death of Judge Jeffreys his influence was
powerful in obliterating the evil traditions of the judicial bench
under the Stuart monarchy, and in establishing the modern
conceptions of justice. He was, on the authority and demeanour of English judges.

While still at the bar Lord Chesterfield praised his counsel’s

crown prosecutions as a contrast to the former “bloodhounds
of the crown”; and he described Sir Philip Yorke as “naturally
humane, moderate and decent.” On the bench he had complete
control over his temper; he was always urban and decorous
and usually dignified. His exercise of legal patronage deserves
unmixed praise. As a public man he was upright and, in
comparison with most of his contemporaries, consistent. His
domestic life was happy and virtuous. His chief fault was
avarice, which perhaps makes it the more creditable that,
though a colleague of Walpole, he was never suspected of corrup-
tion. But he had a keen and steady eye to his own advantage,
and he was said to be jealous of all who might become his rivals
for power. His manners, too, were arrogant. Lord Waldegrave
said of Hardwicke that “he might have been thought a great
man had he been less avaricious, less proud, less unlike a gentle-
man.” Although in his youth he contributed to the Spectator
over the signature “Philip Homebred,” he seems early to have
abandoned all care for literature, and he has been reproached
by Lord Campbell and others with his neglect of art and letters.
He married, on the 16th of May 1719, Margaret, daughter
of Charles Cocks (by his wife Mary, sister of Lord Chancellor
Somers), and widow of John Lygon, by whom he had five sons
and two daughters. His eldest daughter, Elizabeth, married
Lord Anson; and the second, Margaret, married Sir Gilbert
Heathcote. Three of his younger sons attained some distinction.
Charles Yorke (q.v.), the second son, became like his father
lord chancellor; the third, Joseph, was a diplomatist, and was
created Lord Dover; while James, the fifth son, became bishop
of Ely.

Lord de Grey was succeeded in the earldom by his eldest son,
Philip Yorke (1720–1795), and earl of Hardwicke, born on
the 19th of March 1720, and educated at Cambridge. In 1741
he became a fellow of the Royal Society. With his brother, Charles
Yorke, he was one of the chief contributors to Athenian Letters;
or the Epistolary Correspondence of an agent of the King of Persia
residing at Athens during the Peloponnesian War (4 vols., London,
1741), a work that for many years had a considerable vogue
and went through several editions. He sat in the House of
Commons as member for Reigate (1741–1747), and afterwards
for Cambridgeshire; and he kept notes of the debates which
were afterwards embodied in Cobbett’s Parliamentary History.
He was styled Viscount Royston from 1754 till 1764, when he
succeeded to the earldom. In politics he supported the Rocking-
ham Whigs. He held the office of teller of the exchequer, and
was lord-lieutenant of Cambridgeshire and high steward of
Cambridge University. He edited a quantity of miscellaneous
state papers and correspondence, to be found in MSS. collections
in the British Museum. He died in London, on the 16th of May
1790. He married Jemima Campbell, only daughter of John,
3rd earl of Breadalbane, and granddaughter and heiress of Henry
campbell, duke of Kent, who became in her own right marchioness
de Grey.

In default of sons, the title devolved on his nephew, Philip

HARDWICKE, LORD

945
Yorke (1757–1834), 3rd Earl of Hardwicke, eldest son of Charles Yorke, Lord chancellor, by his first wife, Catherine Freman, who was born on 31st of May 1757 and was educated at Cambridge. He was M.P. for Cambridgeshire, following the Whig traditions of his elder brother Sir Henry Yorke (1753–1817), 2nd Earl of Hardwicke, who supported Pitt, and took office in 1801 as Lord Lieutenant of Ireland (1801–1806), where he supported Catholic emancipation. He was created K.G. in 1803, and was a fellow of the Royal Society. He married Elizabeth, daughter of James Lindsay, 5th Earl of Balcarres, in 1782, but left no son.

He was succeeded in the peerage by his nephew, Charles Philip Yorke (1799–1832), 4th Earl of Hardwicke, English admiral, eldest son of Admiral Sir Joseph Sydney Yorke (1768–1821), who was himself second son of Charles Yorke, lord chancellor, by his second marriage to Frances, daughter of Edward Foulche de Billy, served in the Royal Navy in the War of the First Coalition at Southampton on the 2nd of April 1799 and was educated at Harrow. He entered the royal navy in 1815, and served on the North American station and in the Mediterranean, attaining the rank of captain in 1825. He represented Reigate (1831) and Cambridgeshire (1832–1834) in the House of Commons; and after succeeding to the earldom in 1834, was appointed a lord in waiting by Sir Robert Peel in 1841. In 1838 he retired from the active list with the rank of rear-admiral, becoming vice-admiral in the same year, and admiral in 1845. He was a member of the CABARET, and sat as a king's envoy in the house of commons and lord privy seal in 1848. In 1853 he married Susan, daughter of the 1st Lord Ravensworth, by whom he had five sons and three daughters. His eldest son, Charles Philip Yorke (1836–1897), 5th Earl of Hardwicke, was comptroller of the household of Queen Victoria (1868–1886) and master of the buckhounds (1874–1886). He was married in 1880, Sophia Georgiana, daughter of the 1st Earl Cowley. He was succeeded by his only son Albert Edward Philip Henry Yorke (1867–1904), 6th Earl of Hardwicke, who, after holding the posts of under-secretary of state for the colonies (1900–1901) and corresponding secretary of the British Museum. See, especially, the Hardwicke Papers; the Stowe MSS.; Hist. MSS. Commission (Reports 2, 3, 4, 6, 8, 9, 11); Horace Walpole, Letters (ed. by W. C. H. Cunningham, 8 vols., London, 1877–1889); Letters of Lord Minto (ed. by J. C. D. Boyce, London, 1892); Memoirs of the Reign of George II. (ed. by Lord Holland, 2nd ed. revised, London, 1847); Memoirs of the Reign of George III. (ed. by Sir C. Dilke, Cambridge, 1853); Catalogue of Noble Authors of England, Scotland and Ireland (ed. by T. Park, 5 vols., London, 1860). Horace Walpole was violently hostile to Hardwicke, and his criticism, therefore, must be taken with extreme reserve. See also the early Waldegrave, Memoirs 1753–1758 (London, 1821); Lord Chesterfield, Letters (ed. by Lord Mahon, 5 vols., London, 1892); Richard Cocke, Essay on John, Lord Somers, and Philip, Earl of Hardwicke (Worcester, 1791); William Cox, Memoirs of Sir R. Walpole (4 vols., London, 1816); Memoirs of the Administration of Henry Pelham (2 vols., London, 1829); Lord Campbell, Lives of the Lord Chancellors, vol. v. (5 vols., London, 1845); Edward Pococke, The Judges of England, vols. I. and II. (9 vols., London, 1848–1864); George Harris, Life of Lord Chancellor Hardwicke; with Selections from his Correspondence, Diaries, Speeches and Judgments (3 vols., London, 1847). The last-named work may be consulted for the lives of the 2nd and 3rd Earls. For the 3rd earl see also the duke of Buckingham, Memoirs of the Court and Cabinets of George III. (4 vols., London, 1835–1838). For the 4th earl, see Charles Philip Yorke, by his daughter, Lady Angela, countess of Ledbury (1910). (R. J. M.)

HARDY, ALEXANDRE (1596–1611), French dramatist, was born in Paris. He was one of the most fertile of all dramatic authors, and himself claimed to have written some six hundred plays, of which, however, only thirty-four are preserved. He seems to have been connected all his life with a troupe of actors headed by a clever comedian named Valleran-Cometoc, whom he provided with plays. Hardy toured the provinces with this company, which gave some representations in Paris in 1599 at the Hôtel de Bourgogne. Valleran-Cometoc occupied the same theatre in 1600–1603, and again in 1607, apparently for some years. In consequence of disputes with the Confrérie de la Toison d’Or, which owned the privilege of the theatre, they played elsewhere in Paris and in the provinces for some years; but in 1628, when they had long borne the title of “royal,” they were definitely established at the Hôtel de Bourgogne. Hardy’s numerous dedications never seem to have brought him riches or patrons. His most powerful friend was Isaac de La Ffennais (d. 1657), one of Richelieu’s most unscrupulous agents, and he was on friendly terms with the poet Théophile, who addressed him in some verses placed at the head of his Théâtre (1632), and Tristan l’Hermite had a similar admiration for him. Hardy’s plays are written in the lyrique, now almost entirely out of date in the interest of the company that they should not be printed and thus fall into the common stock. But in 1632 he published Les Chasles et loyales amours de Thabaghe et Caridéle, a tragédie in eight “days” or dramatic poems; and in 1634 he began a collected edition of his works, Le Théâtre d’Alexandre Hardy, parisien, of which five volumes (1624–1628) were published, one at Rouen and the rest in Paris. These comprise eleven tragedies: Dédon se sacrifiant, Sédusée ou l’hospitalité violée, Panéhée, Milédage, La Mort d’Achille, Coriolan, Marianne, L’Islande, L’Hermite, La Belle Mort d’Alexan; five comedies: La Dame élégante, five mythological pieces: thirteen tragi-comedies, among them Gisippé, drawn from Boccaccio; Phaëtre, taken from Giraldf’s Cent excellentes nouvelles (Paris, 1584); Cornélis, La Force du sang, Félistémé, La Belle Égyptienne, taken from Spanish subjects; and five pastoral, of which the best is Alphée, ou la justice d’amour. Hardy’s importance in the history of the French theatre can hardly be over-estimated. Up to the end of the 16th century medieval farce and spectacle kept their hold on the stage in Paris. The French classical tragedy of Éléonore Jodelle and his followers had been written for the learned, and in 1628 when Hardy’s work was nearly over and Rotrou was on the threshold of his career, very few literary dramas by any other author are known to have been publicly represented. Hardy educated the popular taste, and made possible the dramatic activity of the 17th century. He had abundant practical experience of the stage, and modified tragedy accordingly, suppressing chorus and monologue, and providing the action and variety which was denied to the literary drama. He was the father in France of tragi-comedy, but cannot fairly be called a disciple of the romantic school in England.

It is impossible to know how much later dramatists were indebted to him in detail, since only a fraction of his work is preserved, but their general obligation is amply established. He died in 1631 or 1632.

The sources for Hardy’s biography are extremely limited. The account given by the brothers Parfaitic in their Hist. du théâtre français (1745, éc. vol. iv. pp. 2–4) must be received with caution, and no documents are forthcoming. Many writers have identified him with the provincial playwright picturesquely described in chap. xi. of Le Page disgracié (1645), the autobiography of Tristan l’Hermite, but if the portrait is drawn from life at all, it is more probably drawn from Théophile. See Le Théâtre d’Alexandre Hardy, edited by E. Stengel (Marburg and Paris, 1883–1884, 5 vols.); E. Lombard, “Etude sur Alexandre Hardy,” in Zeitschr. für neutranz. Spr. u. Lit. (Opladen and Leipzig, vols. I. and II. 1886–1891); K. Nagel, A. Hardy’s Einfluss auf Pierre Corrèze (Marburg, 1884); and especially E. Rigal, Alexandre Hardy . . . (Paris, 1889) and Le Théâtre français avant la période classique (Paris, 1901).

HARDY, THOMAS (1832– ), English novelist, was born in Dorsetshire on the 2nd of June 1832. His family was one of the branches of the Dorset Hardys, formerly of influence in and around the county, and was a descendent of the ancient family of Hardy of Jersey (son of Clement Le Hardy, lieutenant-governor of that island in 1488), who settled in the west of England. His maternal ancestors were the Swetman, Childs or Child, and kindred families, who before 1652 were small landed proprietors in Melbury Osmond, Dorset, and adjoining parishes.

He was educated at local schools, 1848–1854, and afterwards privately, and in 1856 was articled to Mr John Hicks, an
eclesiastical archtct of Dorchester. In 1839 he began writing verse and essays, but in 1861 was compelled to apply himself more strictly to architecture, sketching and measuring many old Dorset churches with a view to their restoration. In 1862 he went to London (which he had first visited at the age of nine) and became assistant to the late Sir Architect. In 1863 he won the medal of the Royal Institute of British Architects for an essay on Coloured Brick and Terra-cotta Architecture, and in the same year won the prize of the Architectural Association for design. In March 1865 his first short story was published in Chamber's Journal, and during the next two or three years he wrote a good deal of verse, being somewhat uncertain whether to take to architecture or to literature as a profession. In 1867 he left London for Weymouth, and during that and the following year wrote a "purpose" story, which in 1869 was accepted by Messrs Chapman and Hall. The manuscript had been read by Mr George Meredith, who asked the writer to call on him, and advised him not to print it, but to try another, with more plot. The manuscript was withdrawn and re-written, but never published. In 1870 Mr Hardy took Mr Meredith's advice too literally, and constructed a novel that was all plot, which was published in 1871 under the title Desperate Remedies. In 1872 appeared Under the Greenwood Tree, a "rural painting of the Dutch school," in which Mr Hardy had already "found himself," and which he has never surpassed in happy and delicate perfection of art. A Pair of Blue Eyes, in R.A. tradition and irony come into his work together, was published in 1873. In 1874 Mr Hardy married Emma Lavinia, daughter of the late T. Atterbes Gifford of Plymouth. His first popular success was made by Far from the Maddening Crowd (1874), which, on its appearance anonymously in the Cornhill Magazine, was attributed by many to George Eliot. Then came The Hand of Ethelberta (1876), described, not inaptly, as "a comedy in chapters"; The Return of the Native (1878), the most sombre and, in some ways, the most powerful and characteristic of Mr Hardy's works; The Trumpet-Major (1881); Two on a Tower (1882), a long excursion in constructive irony; The Mayor of Casterbridge (1886); The Woodlanders (1887); Wessex Tales (1888); A Group of Noble Dames (1891); Tess of the D'Urbervilles (1893), Mr Hardy's most famous novel; Life's Little Ironies (1894); Jude the Obscure (1895), his most thoughtful and least popular book; The Well-Beloved, a reprint, with some revision, of a story originally published in the Illustrated London News in 1892 (1897); Wessex Poems, written during the previous thirty years, with illustrations by the author (1898); and The Dynasts (2 pts. 1904—1906). In 1896 appeared Time's Laughing-stocks and other Verses. In all his work Mr Hardy is concerned with one thing, seen under two aspects; not civilization, nor manners, but the principle of life itself, invisibly realized in humanity as sex, seen visibly in the world as what we call nature. He is a fatalist, perhaps rather a determinist, and he studies the workings of fate or law (ruling through inexorable moods or humours), in the chief vivifying and disturbing influence in life, women. His view of women is more French than English; it is subtle, a little cruel, not as tolerant as it seems, thoroughly a man's point of view, and, as with Mr Meredith, man's and woman's at once. He sees all that is irresponsible for good and evil in a woman's character, all that is untrustworthy in her brain and will, all that is alluring in her variability. He is her apostle, but always with a reserve of private judgment. No one has created more attractive women of a certain class, women whom a man would have been more likely to love or to regret loving. In his earlier books he is somewhat careful over the reputation of his heroines; gradually he allows them more liberty, with a franker treatment of instinct and its consequences. His work is perhaps the most unbiased consideration in English fiction of the most complicated questions of sex. There is almost no passion in his work, neither the author nor his characters ever seeming able to pass beyond the state of curiosity, the most intellectually interesting of limitations, under the influence of any emotion. In his feeling for nature, curiosity sometimes seems to broaden into a more intimate communion. The heath, the village with its peasants, the change of every hour among the fields and on the roads of that English countryside which he has made his own—the Dorsetshire and Wiltshire "Wessex"—mean more to him, in a sense, than even the spectacle of man and woman in their blind andruitless struggle and labours. The knowledge of a woman confirms him in his impression of judgment; his knowledge of nature brings him nearer to the unchanging and consoling element in the world. All the entertainment which he gets out of life comes to him from his contemplation of the peasant, as himself a rooted part of the earth, translating the dumbness of the fields into humour. His peasants have been compared with Shakespeare's; he has the Shakespearean sense of their placid vegetation by the side of hurrying animal life, to which they act the part of chorus, with an unconscious wisdom in their close, narrow, and undisturbed view of things. The order of merit was conferred upon Mr Hardy in July 1910.

See Annie Macdonell, Thomas Hardy (London, 1894); Lionel P. Johnson, The Art of Thomas Hardy (London, 1894). (A. S.)

HARDY, SIR THOMAS DUFFUS (1804—1878), English antiquary, was the third son of Major Thomas Bartholomew Price Hardy, and belonged to a family several members of which had distinguished themselves in the British navy. Born at Port Royal in Jamaica on the 22nd of May 1804, he crossed over to England and in 1819 entered the Record Office in the Tower of London. Here he devoted himself to the study of Early English Chronicle, and acquired a sound knowledge of palaeography, and soon began to edit selections of the public records. From 1861 until his death on the 15th of June 1878 he was deputy-keeper of the Record Office, which just before his appointment had been transferred to its new London headquarters in Chancery Lane. Hardy, who was knighted in 1873, had much to do with the appointment of the Historical Manuscripts Commission in 1860.

Sir T. Hardy edited the Close Rolls, Rotuli Illetrarum clausarum, 1227—1227 (2 vols., 1833—1844, with an introduction entitled "A Description of the Close Rolls, with an Account of the early Courts of Law and Equity"); and the Patent Rolls, Rotuli Illetrarum postea, 1227—1227 (1835), with introduction, "A Description of the Patent Rolls, to which is added an Itinerary of King John." He also edited the Rotuli de oblatis et finibus (1839), which deal also with the time of King John; the Rotuli Normanniæ, 1200—1205, and 1217—1418 (1839), containing letters and grants of the English kings concerning the duchy of Normandy; the Charter Rolls, Rotuli chartarum, 1190—1205 (1837), giving with this work an account of the structure of Charters; the Liber Rolls, Rotuli de libera ac de misis et praestatibus in pago Warenham (1845—1848), with a translation (1846). He wrote A Catalogue of Lords Chancellors, Keepers of the Great Seal, Masters of the Rolls and Officers of the Record Office (1843), and Chronicles of the English People from the Foundation of the Monarchia historica Britanniae (1845); and Descriptive Catalogue of Materials relating to the History of Great Britain and Ireland (3 vols., 1862—1871). He edited William of Malmesbury's De gestis regum Anglie (3 vols., 1844—1846); and Petrie's Fasti ecclesiastici Angliae (3 vols., Oxford, 1854); and with C. T. Martin he edited and translated L'Estoire des Engles of Geoffrey Gaimar (1888—1889). He wrote Syllabus in English of Documents in Rymer's Foederæ (3 vols., 1866—1888), and gave an account of the history of the public records from 1837 to 1841 in his Memoirs of the Life of Henry, Lord Langdale (1852), Lord Langdale (1785—1851), master of the rolls from 1836 to 1851, being largely responsible for the erection of the new Record Office. Hardy took part in the controversy about the date of the Athenian creed, writing The Athenian Creed in connection with the Ulrici Psalter (1872); and Fowler's Antiquary on the Constitution of England (1873).

His younger brother, Sir William Hardy (1807—1887), was also an antiquary. He entered the Record Office in 1823, leaving it in 1830 to become keeper of the records of the duchy of Lancaster. In 1868, when these records were presented by Queen Victoria to the nation, he returned to the Record Office as an assistant keeper, and in 1878 he succeeded his brother Sir Thomas as deputy-keeper, resigning in 1886. He died on the 17th of March 1887.

Sir W. Hardy edited Jehan de Waurin's Recueil des chroniques et annales des Royaumes de France (2 pts., 1864—1866), and he translated and edited the Charters of the Duky of Lancaster (1845).

HARDY, SIR THOMAS MASTERMAN, Bart. (1760—1839). British vice-admiral, of the Portisham (Dorsetshire) family of Hardy, was born on the 5th of April 1769, and in 1781 began
his career as a sailor. He became lieutenant in 1793, and in 1796, being then attached to the "Minerve" frigate, attracted the attention of Nelson by his gallant conduct. He continued to serve with distinction, and in 1798 was promoted to be captain of the "Vanguard," Nelson's flagship. In the "St George" he did valuable work before the battle of Copenhagen in 1801, and his association with Nelson was crowned by his appointment in 1803 to the "Victory" as flag-captain, in which capacity he was engaged at the battle of Trafalgar in 1805; witnessed Nelson's will, and was in close attendance on him at his death. Hardy was created a baronet in 1806. He was then employed on the North American station, and later (1810), was made commodore and commander-in-chief on the South American station, with which he was so closely connected that after his death the English nation and the United States of America decided to honor him by erecting a memorial to his memory. In 1812 he became rear-admiral, and in December 1826 escorted the expeditionary force to Lisbon. In 1830 he was made first sea lord of the admiralty, being created G.C.B. in 1831. In 1834 he was appointed governor of Greenwich hospital, where thenceforward he devoted himself with conspicuous success to the charge of the naval pensioners; in 1837 he became vice-admiral. He died at Greenwich on the 20th of September 1839. In 1807 he had married Anne Louisa Emily, daughter of Sir George Cranfeld Berkeley, under whom he had served on the North American station, by her he had three daughters, the baronetcy becoming extinct. See Marshall, Royal Naval Biography, ii. and iii.; Nicolas, Dispatches of Lord Nelson; Broadley and Bartelot, The Three Dorset Captains at Trafalgar, (1866), and Nelson's Hardy, His Life, Letters and Admirals (1896).

HARDY or HARDING, JOHN (1378-1469). English chronicler, was born in the north, and as a boy entered the service of Sir Henry Percy (Hotspur), with whom he was present at the battle of Shrewsbury (1403). He then passed into the service of Sir Robert Umfraville, under whom he was constable of Warkworth Castle, and served in the campaign of Agincourt in 1415 and in the sea-fight before Harfleur in 1416. In 1424 he was on a diplomatic mission at Rome, where at the instance of Cardinal Beaufort he consulted the chronicle of Trogis Pompeius. Umfraville, who died in 1436, had made Hardyng constable of Kyme in Lincolnshire, where he probably lived till his death about 1465. Hardyng was a man of antiquarian knowledge, and under Henry V. was employed to investigate the feudal relations of Scotland to the English crown. For this purpose he visited Scotland, at much expense and hardship. For his services he says that Henry V. promised him the manor of Geddington in Northamptonshire. Many years after, in 1439, he had a grant of £10 a year for similar services. In 1457 there is a record of the delivery of documents relating to Scotland by Hardyng to the earl of Shrewsbury, and his reward by a further pecuniary grant. It is clear that Hardyng was well acquainted with Scotland, and James I. is said to have offered him a bribe to surrender his papers. But the documents, which are still preserved in the Record Office, have been shown to be forgeries, and were probably manufactured by Hardyng himself. Hardyng spent many years on the composition of a rhyming chronicle of England. His services under the Percies and Umfravilles gave him opportunity to obtain much information of value for 15th century history. As literature the chronicle has no merit. It was written and rewritten to suit his various patrons. The original edition ending in 1436 had a Lancastrian bias and was dedicated to Henry VI. Afterwards he prepared a version for Richard, duke of York (d. 1460), and the chronicle in its final form was presented to Edward IV. after his marriage to Elizabeth Woodville in 1464.

The version of 1436 is preserved in Lansdowne MS. 204, and the best of the later versions in Harley MS. 661, both in the British Museum. Richard Grafton printed two editions in January 1543, which differ much from each other and from the now extant manuscripts. Stow, who was acquainted with a different version, censured Grafton on this point somewhat unjustly. Sir Henry Ellis published the longer version of Grafton with some additions from the Harley MS. in 1812. See Ellis' preface to Hardyng's Chronicle, and Sir F. Palgrave's Documents Illustrating the History of Scotland (for an account of Hardyng's forgeries). (C. L. K.)

HARE, AUGUSTUS JOHN GUTHBERT (1834-1903). English writer and traveller, was born at Rome in 1834. He was educated at Christ Church, Oxford, and in 1851, went with his father to Naples where Dr F. E. Hare, a writer of some reputation in Italy, was the�� mark of his aunt by whom he had been adopted when a baby (1872), and a devotedly long autobiography in six volumes, The Story of My Life. He died at St Leonards-on-Sea on the 27th of January 1903. His name is familiar as the author of a large number of guide-books to the principal countries and towns of Europe, most of which were written to order for John Murray. They were made up partly of the author's own notes of travel, partly of quotations from others' books taken with a frankness of appropriation that disarmed criticism. He also wrote Memoirs of a Quiet Life— that of his aunt by whom he had been adopted when a baby (1872), and a long autobiography in six volumes, The Story of My Life. He died at St Leonards-on-Sea on the 27th of January 1903.

HARE, SIR JOHN (1844— ), English actor and manager, was born in Yorkshire on the 10th of May 1844, and was educated at Giggleswick school, Yorkshire. He made his first appearance on the stage at Liverpool in 1864, coming to London in 1865, and acting for ten years with the Bancrofts. He soon made his mark, particularly in T. W. Robertson's comedies, and in 1875 became manager of the Court theatre. But it was in association with Mr and Mrs Kendal at the St James's theatre from 1879 to 1885 that he established his popularity in London, in important parts of "Much Ado about Nothing" and "Macbeth," and, the management of Hare and Kendal making this theatre one of the chief centres of the dramatic world for a decade. In 1885 he became lessee and manager of the Garrick theatre, where (though he was often out of the cast) he produced several important plays, such as Pinero's The Prodigal and The Notorious Mrs Ebbsmith, and had a remarkable personal success in the chief part in Sydney Grundy's A Pair of Spectacles. In 1897 he took the Globe theatre, where his acting in Pinero's Gay Lord Quix was another personal triumph. He became almost as well known in the United States as in England, his last tour in America being in 1900 and 1901. He was knighted in 1907.

HARE, JULIUS CHARLES (1795-1855). English theological writer, was born at Valdagni, near Vicenza, in Italy, on the 13th of September 1795. He came to England with his parents in 1799, but in 1804-1805 spent a winter with them at Weimar, where he met Goethe and Schiller, and received a bias to German literature which influenced his style and sentiments throughout his whole career. On the death of his mother in 1806, Julius was sent home to the Charterhouse in London, where he remained till 1812, when he entered Trinity College, Cambridge. There he became fellow in 1818, and after some time spent abroad he began to read law in London in the following year. From 1822 to 1832 he was assistant-tutor at Trinity College. Turning his attention from law to divinity, Hare took priest's orders in 1826, and, on the death of his uncle in 1832, he succeeded to the rich family living of Hurstmonceaux in Sussex, where he accumulated a library of some 12,000 volumes, especially rich in German literature. Before taking up residence in his parish he once more went abroad, and made in Rome the acquaintance of the Chevalier Bunsen, who afterwards dedicated to him part of his work, Hippolytus and his Age. In 1846 Hare was appointed archdeacon of Lewes, and in the same year preached a course of sermons at Cambridge (The Victory of Faith), followed in 1846 by a second, The Mission of the Comforter. Neither series when published attained any great popularity. Archdeacon Hare married in 1844 Esther, a sister of his friend Frederick Maurice. In 1851 he was collated to a prebend in Chichester; and in 1853 he became one of Queen Victoria's chaplains. He died on the 23rd of January 1855.

Julius Hare belonged to what has been called the "Broad Church Party," though some of his opinions approached very closely to those of the Evangelical Arminian school, while others again seem vague and undecided. He was one of the first of his countrymen to recognize and come under the influence of the German theologians and anti-exaggerated alarm of German heresy, did much to vindicate the authority of the sounder German critics. His writings, which are chiefly theological and controversial, are largely formed of changed or his chief opinions on different topics; but, though valuable and full of thought, they lose some of their force by the cumbersome German structure of the sentences, and by certain orthographical peculiarities in which the author
the sea about a mile in width. Hares are remarkably prolific, pairing when scarcely a year old, and the female bringing forth several broods in the year, each consisting of from two to five leverets (from the Fr. lievre), as the young are called. These are born covered with hair and with the eyes open, and after being suckled for a month are able to look after themselves. In Europe this species has seldom bred in confinement, although an instance has recently been recorded. It will interbreed with the blue hare. Hares (and rabbits) have a cosmopolitan distribution with the exception of Madagascar and Australasia; and are now divided into numerous genera and subgenera, mentioned in the article

HARE—HAREBELL

ordinary fleetness. On the first alarm of danger it sits erect to reconnoitre, when it either seeks concealment by clapping close to the ground, or takes to flight. In the latter case its great speed, and the cunning endeavours it makes to outwit its canine pursuers, form the chief attractions of coursing. The hare takes readily to the water, where it swims well; an instance having been recorded in which one was observed crossing an arm of

Fig. 1.—The Hare (Lepus europaeus).
HAREM

is a term used for the female quarters in a Middle Eastern house. It is the opposite of the male quarters, known as the seraglio. The harem was traditionally the exclusive property of the head of the household, who could have any number of concubines and slaves. The harem was a microcosm of the larger society, where women were kept isolated from the outside world.

HAREM, less frequently HARAM or HARIM (Arab harim—commonly but wrongly pronounced hârem—"that which is illegal or prohibited"). the name generally applied to that part of a house in Oriental countries which is set apart for the women; it is also used descriptively for the women themselves. Strictly the women’s quarters are the haremlık (lik, belonging to), as opposed to selamlık the men’s quarters, from which they are in large houses separated by the mabëin, the private apartments of the householder. The word harem is strictly applicable to Mahomedan households only, but the system is common in greater or less degree to all Oriental communities, especially where polygamy is permitted. Other names for the women’s quarters are Seraglio (Ital. serraglio), literally an enclosure, from Lat. sēra, a bar; wrongly narrowed down to the sense of harem through confusion with Turkish cerrā or tārdā, palace or large building; e.g. cerrā diivāna; Zanana (strictly zanana, from Persian zan, woman, allied with Gr. γυνὴ, used specifically of Hindu harems; Andarān (or Anderoon), the Persian word for "the inner part" (sc. of a house). The Indian hareem system is also commonly known as purdah or purdah, literally the name of the thick curtains or blinds which are used instead of doors to separate the women’s quarters from the rest of the house. A male doctor attending a zenana lady would put his hand between the purdah to feel her pulse.

The seclusion of women in the household is fundamental to the Oriental conception of the sex relation, and its origin must, therefore, be sought far earlier than the precepts of Islam as set forth in the Koran, which merely regulate a practically universal Eastern custom. It is inferred from the remains of many ancient Oriental palaces (Babylonian, Persian, &c.) that kings and wealthy nobles devoted a special part of the palace to their womankind. Though in comparatively early times there were not wanting men who regarded polygamy as wrong (e.g. the prophets of Israel), nevertheless, in the East generally there has never been any real movement against the conception of woman as a chattel of her male relatives. A man may have as many wives and concubines as he can support, but each of these women must be

dedicated to the care of his household and family.

A man may have as many wives and concubines as he can support, but each of these women must be

1 In Africa also, among the non-Mahomedan negroes of the west coast and the interior of the Ve's, many Nyan, the seclusion of women of the upper classes has been practised in states (e.g. Ashanti and Buganda) possessing a considerable degree of civilization.
for secretarial work. Discipline is strict, and continued disobedience leads to corporal punishment by the eunuchs. All the women of the harem are absolutely under the control of the sultana validé (who alone of the harem of her dead husband is not sent away to an older palace when her son succeeds), and owe her the most profound respect, even to the point of having to obtain permission to leave their own apartments. Her financial secretary, the Hizanodor Ouesta, succeeds to her power if she dies. The sultan's foster-mother also is a person of importance, and is known as the Tuzi-Kodin.

The security of the harem is in the hands of a body of eunuchs both black and white. The white eunuchs have charge of the outer gates of the seraglio, but they are not allowed to approach the women's apartments, and obtain no posts of distinction, their chief, however, the kâpa oğası ("master of the gates") has part control over the ecclesiastical possessions, and even the vizier cannot enter the royal apartments without his permission. The black eunuchs have the right of entering the gardens and chambers of the harem. Their chief, usually called the kudar oğası ("master of the maidsens"), though his true title is darus şadet aga ("chief of the abode of felicity"), is an official of high importance. His appointment is for life. If he is deprived of his post he receives his freedom; and if he resigns of his own accord he is generally sent to Egypt with a pension of 100 francs a day. His secretary keeps count of the revenues of the mosques built by the sultans. He is usually succeeded by the second eunuch, who bears the title of treasurer, and has charge of the jewels, &c., of the women. The number of eunuchs is always a large one. The sultana validé and the sultana hassekî have each fifty at their service, and others are assigned to the kadins and the favourite odalisks.

The ordinary middle-class household is naturally on a very different scale. The selâmî is on the ground floor with a separate entrance, and there the master of the house receives his male guests; the rest of the ground floor is occupied by the kitchen and perhaps the stables. The haremlî is generally (in towns at least) on the upper floor fronting on and slightly overlooking the street; it has a separate entrance, courtyard and garden. The windows are guarded by lattices pierced with circular holes through which the women may watch without being seen. Communication with the haremlî is effected by a locked door, of which the Effendi keeps the key and also by a sort of revolving cupboard (duduk) for the conveyance of meats. The furniture, of the old-fashioned harems at least, is confined to divans, rugs, carpets and mirrors. For heating purposes the old brass tray of charcoal and wood ash is giving way to American stoves, and there is a tendency to import French furniture and decoration without regard to their suitability.

The presence of a second wife is an exception, and is generally attached to a certain number of children by the first wife. The expense of marrying a free woman leads many Turks to prefer a slave woman who is much more likely to be an amenable partner. If a slave woman bears a child she is often set free and then the marriage ceremony is gone through.

The harem system, of course, wholly inconsistent with any high ideal of womanhood. Certain misapprehensions, however, should be noticed. The depravity of the system and the rapid idleness of harem life are much exaggerated by observers whose sympathies are wholly against the system. In point of fact much depends on the individuals. In many households there exists a very high degree of mutual consideration and the standard of conduct is by no means degraded. Though a woman may not be seen in the streets without the yashmak which covers her face except for her eyes, and does not leave her house except by her husband's permission, none the less in ordinary households the harem ladies frequently drive into the country and visit the shops and public baths. Their seclusion has very considerable compensations, and legally they stand on a far better basis in relation to their husbands than do the women of monogamous Christian communities. From the moment when a woman, free or slave, enters into any kind ofurdy relation with a man, she has a legally enforceable right against him both for her own and for her children's maintenance. She has absolute control over her personal property whether in money, slaves or goods; and, if divorce is far easier in Islam than in Christendom, still the marriage settlement must be of such amount as will provide suitable maintenance in that event.

On the other hand, of course, the system is open to the gravest abuse, and in countries like Persia, Morocco and India, the life of Moslem women and slaves is often far different from that of middle class women of European and Turkey, where law is an individual and culture advanced. The early age at which girls are secluded, the dulness of their surroundings, and the low moral standard which the system produces react unfavourably not only upon their moral and intellectual growth but also upon their capacity for motherhood and their general physique. A harem woman is soon passée, and the lot of a woman past her youth, if she is divorced or a widow, is monotonous and empty. This is true especially of child-widows. Since the middle of the 19th century familiarity with European customs and the direct influence of European administrators has brought about a certain change in the attitude of Orientals to the harem system. This movement is, however, only in its infancy, and the impression is still strong that the time is not ripe for reform. The Oriental women are in general so accustomed to their condition that few have any inclination to change it, while men as a rule are emphatically opposed to any alteration of the system. The Young Turkish party, the upper classes in Egypt, as also the Bahists in Persia, have to some extent progressed beyond the orthodox conception of the status of women, but revolution has not been set on foot. American girls is so steady, that reform has touched only the fringe of the system. Among the principal societies which have been formed to better the condition of Indian and Chinese women in general with special reference to the zenana system are the Church of England Zenana Missionary Society and the Zenana Bible and Medical Mission. Much information as to the medical, industrial and educational work done by these societies will be found in their annual reports and other publications. Among these are J. K. H. Denny's Toward the Uprising; Irene H. Barnes, Bonded and the Pardakat; W. S. Ramsay, a report on the present condition of the former society's work; the general condition of Indian women is described in Mrs Marcus B. Fuller's Wrongs of Indian Womanhood (1900), and Maud Dover's The Englishwoman in India (1909); see also article Missions.

Authorities.—The literature of the subject is very large, though a proof of it is naturally based on insufficient evidence, and collected by Westerners. The most useful works are A. van Sommer and Zwemer, Our Moslem Sisters (1907), a collection of essays by authors acquainted with various parts of the Mahomedan world and strongly opposed to the whole harem system; Mrs W. M. Ramsay, Everyday Life in Turkey (1897), etc., iv, and v, containing an account of a day in a harem near Aftum-Kara-Hissar; cf. e.g. article "Harem" in Hughes, Dictionary of Islam; Mrs S. Harvey's Turkish Harem's and Circassian Hives (1871); for
HARLEUR, a port of France in the department of Seine-Inferieure, about 6 m. E. of Havre by rail. Pop. (1896) 2864. It lies in the fertile valley of the Lézarde, at the foot of wooded hills not far from the north bank of the estuary of the Seine. The port, which had been rendered almost inaccessible owing to the deposits of the Lézarde, again became available on the opening of the Tancarville canal (1887) connecting it with the port of Havre and with the Seine. Vessels drawing 18 ft. can moor alongside the quays of the new port, which is on a branch of the canal, has some trade in coal and timber, and carries on fishing. The church of St Martin is the most remarkable building in the town, and it is the lofty stone steeple forming a landmark for the pilots of the river. It dates from the 15th and 16th centuries, but the great portal is the work of the 17th, and the whole has undergone modern restoration. Of the old castle there are only insignificant ruins, near which, in a fine park, stands the present castle, a building of the 17th century. The old ramparts of the town are now replaced by manufactories, and the fosses are transformed into vegetable gardens. There is a statue of Jean de Grouchy, lord of Montcornell, under whose leadership the English were expelled from the town in 1435. The industries include distilling, metal founding and the manufacture of oil and grease.

Harleur is identified with Carocelitium, the principal port of the ancient Calates. In the middle ages, when its name, Herosloth, Harolect or Harelott, was still sufficiently uncorrupted to indicate its Norman derivation, it was the principal seaport of north-western France. In 1415 it was captured by Henry V. of England, but when in 1435 the people of the district of Caux rose against the English, 104 of the inhabitants opened the gates of the town to the invaders, and then the English were expelled by the counts of the foreign yoke. The memory of the deed was long perpetuated by the bells of St Martin's tolling 104 strokes. Between 1445 and 1449 the English were again in possession; but the town was recovered for the French by Dunois. In the 16th century the port began to dwindle in importance owing to the sitting up of the Seine estuary and the rise of Havre. In 1562 the Huguenots put Harleur to pillage, and its registers and charters perished in the confusion; but its privileges were restored by Charles IX. in 1568, and it was not till 1710 that it was subjected to the "taille."

HARIANA, a tract of country in the Punjab, India, once the seat of a flourishing Hindu civilization. It consists of a level upland plain, interspersed with patches of sandy soil, and largely overgrown with brushwood. The Western Jumna canal irrigates the fields of a large number of its villages. Since the 14th century Hisar has been the local capital. During the troubled period which followed on the decline of the Mogul empire, Hariana formed the battlefield where the Maharrats, Bhatins and Sikhs met to settle their territorial quarrels. The whole country was devastated by the famine of 1781. In 1707-1708 Hariana was overrun by the famous Irish adventurer George Thomas, who established his capital at Hansi; in 1801 he was dispossessed by Sindhia's French general Perron; in 1803 Hariana passed under British rule. On the conquest of the Punjab Hariana was broken up into the districts of Hisar, Rohtak and Sirsa, which has now in its turn been divided between Hisar and Ferozepore.

HARINGTON, Sir John (1561-1612), English writer, was born at Kelston, near Bath, in 1561. His father, John Harington, acquired considerable estates by marrying Etheldreda, a natural daughter of Henry VIII., and after his wife's death he was attached to the service of the Princess Elizabeth. He married Isabella Markham, one of her ladies, and on May 3rd, 1570, he and his wife were imprisoned in the Tower with the princess. John, the son of the second marriage, was Elizabeth's godson. He studied at Eton and at Christ's College, Cambridge, where he took the degree of M.A., his tutor being John Still, afterwards bishop of Bath and Wells, formerly reputed to be the author of Gammer Gurton's Needle. He came up to London about 1583 and was entered at Lincoln's Inn, but his talents marked him out for court rather than for a legal career. Tradition relates that he translated the story of Gioncondo from Ariosto and was rewarded by the queen for acquainting her ladies with so indiscrte a selection. He was to retire to his seat at Kelston until he completed the translation of the entire work. Orlando Furioso in English heroic verse was published in 1591 and reprinted in 1607 and 1634. Harington was high sheriff of Somerset in 1592 and received Elizabeth at his house during her western progress of 1591. In 1596 he published in succession The Metamorphosis of Ajax, An Anatomie of the Metamorphosed Ajax, and Ulysses upon Ajax, the three forming collectively a very absurd and inconceivable work of a pantomimical kind. An allusion to Leicester in this book threw the writer into temporary disgrace, but in 1598 he received a commission to serve in Ireland under Essex. He was knighted on the field, to the annoyance of Elizabeth. Harington saved himself from being involved in Essex's disgrace by writing an account of the Irish campaign which increased Elizabeth's anger against the unfortunate earl. Among some papers found in the chapter library at York was a Tract on the Succession to the Crown (1603), written by Harington to secure the favour of the new king, to whom he sent the gift of a lantern constructed to symbolize the waning glory of the late queen and James's own splendour. This pamphlet, which contains many details of great interest about Elizabeth and gives an unprejudiced sketch of the religious question, was edited for the Roxburghe Club in 1880 by Sir Clements Markham. Harington's efforts to win favour at the new court were unsuccessful. In 1605 he even asked for the office of chancellor of Ireland and proposed himself as archbishop. The document in which he preferred this extraordinary request was published in 1679 with the title of A Short View of the State of Ireland written in 1613. Harington was at this time advocating a policy of generosity and conciliation towards that country. He eventually succeeded in obtaining a position as one of the tutors of Prince Henry, for whom he annotated Francis Godwin's De praepositiis Anglicae. Harington's grandson, John Chetwold, found in this somewhat scandalous production an argument for the Presbyterian side, and published it in 1653, under the title of A Briefe View of the State of the Church, &c.

Harington died at Kelston on the 20th of November 1612. His Epigrams were printed in a collection entitled Atlilia in 1613, and separately in 1614. The translation of the Orlando Furioso was carried out with skill and perseverance. It is not to be supposed that Harington failed to realize the ironic quality of his original, but he treated it as a serious allegory to suit the temper of Queen Elizabeth's court. He was neither a very exact scholar nor a very poetical translator, and he cannot be named in the same breath with Fairfax. The Orlando Furioso was summarily illustrated, and to it was prefixed an Apologie of Poetrie, justifying the subject matter of the poem, and, among other technical matters, the author's use of disyllabic and disyllabic rhymes also before his time in advocating by a policy of conciliation and conciliation towards that country.

A biographical account of Harington is prefixed to the Roxburghe Club edition of his work on the succession mentioned above.
HARI, R. HARKNESS, R.

HARI [Abü Mahommed ul-Qasim ibn 'Ali ibn Mahommed al-Hari, i.e. "the manufacturer or seller of silk"] (1054-1123). Arabic writer, was born at Baṣra. He owned a large estate with 18,000 date-palms at Māshān, a village near Baṣra. He is said to have occupied a government position, but devoted his life to the study of the niceties of the Arabic language. On this subject he wrote a grammatical poem the Muljudat ul-Islāb (French trans. Les Récitations grammaticales with notes by L. Pinto, Paris 1858-1880; extracts in S. de Sacy's Anthologie arabe, pp. 145-151, Paris, 1839; a work on the faults of the educated called Durrat ul-Qarahād (ed. H. Tscherepnin, 1898). This work rises sometimes to two letters on words containing the letters sin and shin (ed. in Arnold's Christomathy, pp. 202-9). But his fame rests chiefly on his fifty maqāmas (see ARABIA: Literature, section "Belles Lettres"). These were written in rhymed prose like those of Ḥamadānī, and are full of allusions to Arabian history, poetry and tradition, and discussions of difficult points of Arabic grammar and rhetoric. The Maqāmas have been edited with Arabic commentary by S. de Sacy (Paris, 1822, 2nd ed. with French notes by Reina-Pand J. Derenbourg, Paris, 1853); with English notes by F. Steinigg (London, 1896). An English translation with notes was made by T. Preston (London, 1850), and another by T. Chenery and F. Steingass (ed. Leipzig, 1867 and 1898). Many new editions have been published in the East with commentaries, especially with that of Sharfī (1922).

HARI-RUD, a river of Afghanistan. It rises in the northern slopes of the Koh-i-Baba to the west of Kabul, and finally loses itself in the Tejānd oasis north of the Trans-Caspian railway and west of Merv. It runs a remarkably straight course westward through a narrow trough from Ḥaḍrat Aba, amidst the bleak wind-swept uplands of the highest central elevations in Afghanistan. From a height of 9000 ft. above the surrounding desert, and from a height of 50 m. west of Herat, it forms a valley of great fertility, densely populated and highly cultivated; practically all its waters are drawn off for purposes of irrigation. It is the contrast between the cultivated aspect of the valley of Herat and the surrounding desert that has given Herat its great reputation for fertility. Three miles to the southeast of Herat lies the Kandahar road crosses the river by a masonry bridge of 26 arches now in ruins. A few miles below Herat the river begins to turn north-west, and after passing through a rich country to Khūshān, it turns due north and breaks through the Pamīṣān hills. Below Khūshān it receives fresh tributaries from the west. Between Khūshān and Zulīkār it forms the boundary between Afghanistan and Persia, and from Zulīkār to Sārakhs, it forms the boundary between Russia and Persia. North of Sārakhs it diminishes rapidly in volume till it is lost in the sands of the Turkmān desert. The Hari-Rud marks the only important break existing in the continuity of the great central water-parting of Asia. It is the ancient Arius. (T. H. H.)

HARISCHANDRA, in Hindu mythology, the 28th king of the Solar race. He was renowned for his piety and justice. He is the central figure of legends in the Altāreyāhramāna, Mahābhārata and the Markandeyapurana. In the first he is represented as so desirous of a son that he vows to Varuna that if his prayer is granted he shall be eventually sacrificed to the latter. The child is born, but Harischandra, after many delays, arranges to purchase another's son and make a vicarious sacrifice. According to the Mahābhārata he is at last promoted to Paradise as the reward for his munificent charity.

HĀRĪTH IBN HILLIZA UL-YASHIKURI, pre-Islamic Arabian poet of the tribe of Bāqr, famous as the author of one of the poems among the M'o'allsāt (q.v.). Nothing is known of the details of his life.

HARIZI, JUDAH BEN SOLOMON (13th cent.), called also AL-HARI, a Spanish Hebrew poet and traveller. He translated from the Arabic to Hebrew some of the works of Maimonides (q.v.) and also of the Arab poet Hariri. His own most considerable work was the Tahkemoni, composed between 1218 and 1220. This is written in Hebrew in unmetrical rhymes, in what is commonly termed "rhymed prose." It is a series of humorous episodes, witty verses, and quaint applications of Scriptural texts. The episodes are bound together by the presence of the hero and of the narrator, who is also the author. Harizi not only brought to perfection the art of applying Hebrew to secular satire, but he was also a brilliant literary critic and his makame on the Andalusian Hebrew poets is a fruitful source of information.

See, on the Tahkemoni, Kaempf, Nicht-andalusische Poesie andalusischer Dichter (Prague, 1855). In that work a considerable section of the Tahkemoni is translated into German. (I. A.)

HARKNESS, ALBERT (1822-1907), American classical scholar, was born at Mendon, Massachusetts, on the sixth of October 1822. He was educated at Brown University in 1842, taught in the Providence high school in 1843-1853, studied in Berlin, Bonn (where in 1854 he was the first American to receive the degree of Ph.D.) and Göttingen, and was professor of Greek language and literature in Brown University from 1855 to 1892, when he became professor emeritus. He was one of the founders in 1869 of the American Philological Association, of which he was president in 1875-1876, and to whose Transactions he made various contributions; was a member of the Archaeological Institute's committee on founding the American School of Classical Studies at Athens, and served as the second director of that school in 1883-1884. He studied English and German university methods during trips to Europe in 1870 and 1883, and introduced a new scholarly spirit into American teaching of Latin in secondary schools with a series of Latin text-books, which began in 1851 with a First Latin Book and continued for more than fifty years. His Latin Grammar (1864, 1881) and Complete Latin Grammar (1868) are his best-known books. He was a member of the board of fellows of Brown University from 1894 until his death, and in 1904-1905 was president of the Rhode Island Historical Society. He died in Providence, Rhode Island, on the 27th of May 1907.

His son, ALBERT GRANGER HARKNESS (1857- ), also a classical scholar, was born in Providence, Rhode Island, on the 10th of November 1857. He graduated at Brown University in 1879, studied in Germany in 1879-1883, and was professor of German and Latin at Madison (now Colgate) University from 1883 to 1889, and associate professor of Latin at Brown from 1889 to 1893, when he was appointed to the chair of Roman literature and history there. He was director of the American School of Classical Studies in Rome in 1900-1902.

HARKNESS, ROBERT (1816-1878), English geologist, was born at Ormskirk, Lancashire, on the 28th of July 1816. He was educated at the high school, Dumfries, and afterwards (1833-1834) at the university of Edinburgh where he acquired an interest in geology from the teachings of Robert Jameson and J. D. Forbes. Returning to Ormskirk he worked zealously at the local geology, especially on the Coal-measures and New Red Sandstone, his first paper (read before the Manchester Geol. Soc. in 1843) being on The Climate of the Coal Epoch. In 1848 his family went to reside in Dumfries and there he commenced to work on the Silurian rocks of the S.W. of Scotland, and in 1849 he carried his investigations into Cumberland. In these regions during the next few years he added much to our knowledge of the strata and their fossils, especially graptolites, in papers read before the Geological Society of London. He wrote also on the New Red rocks of the north of England and Scotland. In 1853 he was appointed professor of geology in Queen's College, Cork, and in 1856 he was elected F.R.S. During this period he wrote some articles on the geology of parts of Ireland, and exercised much influence as a teacher, but he returned to England during his vacations and devoted himself assiduously to the geology of the Lake district. He was also a constant attendant at the meetings of the British Association. In 1876 the syllabus for the Queen's Colleges in Ireland was altered, and Professor Harkness was required to lecture not only on geology, palaeontology, mineralogy and physical geography, but also on zoology and botany. The strain of the extra work proved too much, he decided to relinquish his post, and had retired but a short time when he died, on the 4th of October 1878.

by The Lady Paramount (1902), that his lightly humorous touch and picturesque style as a novelist brought him any real success. His health was always delicate, and he died at San Remo on the 20th of December 1905.

HARLAY DE CHAMPPALLON, FRANÇOIS DE (1625-1659), 5th archbishop of Paris, was born in that city on the 14th of August 1625. Nephew of François de Harlay, archbishop of Paris, he was presented to the abbey of Jumièges immediately on leaving the Collège de Navare, and he was only twenty-six when he succeeded his uncle in the archiepiscopal see. He was transferred to the see of Paris in 1671, he was nominated by the king for the cardinalate in 1690, and the domain of St Cloud was erected into a duchy in his favour. He was commander of the order of the Saint Esprit and a member of the French Academy. During the early part of his political career he was a firm adherent of Mazarin, and is said to have helped to procure his return from exile. His private life gave rise to much scandal, but he had a great capacity for business, considerable learning, and was an eloquent and persuasive speaker. He definitely secured the favour of Louis XIV. by his support of the claims of the Gallican Church formulated by the declaration made by the clergy in assembly on the 15th of March 1682, when Bossuet accused him of truckling to the court like a valet. One of the three witnesses of the king's marriage with Madame de Maintenon, he was hated by her for using his influence with the king to keep the matter secret. He had a weekly audience of Louis XIV. in company with Père la Chaise on the affairs of the Church in Paris, but his influence gradually waned. He was the only French archbishop known for his good will for his harsh attitude to the Jansenists, says that his friends deserted him as the royal favour waned, until at last most of his time was spent at Conflans in company with the duchess of Lesdiguières, who alone was faithful to him. He urged the revocation of the edict of Nantes, and showed great sympathy to the Huguenots at Dieppe, of which he was temporal and spiritual lord. He died suddenly, without having received the sacraments, on the 6th of August 1693. His funeral discourse was delivered by the Père Gaillard, and Mme de Sévigné made on the occasion the severe comment that there were only two trifles to make this a difficult matter—his life and his death.

See Abh Légendes, Vite Francisci de Harlay (Paris, 1720) and Éloge de Harlay (1695); Saint-Simon, Mémoires (vol. ii., ed. A. de Boisjolie, 1879), and numerous references in the Lettres de Mme de Sévigné.

HARLECH (perhaps for Harld lech, fair slate, or Harleigh, an Anglicized variant), a town of Merionethshire, Wales, 38 m. from Aberystwyth, and 29 from Carnarvon on the Cambrian railway. Pop. 900. Ruins of a fortress crown the rock of Harlech, about half a mile from the sea. Discovery of Roman coins makes it probable that it was once occupied by the Romans. In the 3rd century Bronwen (white bosom), daughter of Bran Fendigaid (the blessed), is said to have stayed here, perhaps by force; and there was here a tower, called Twr Bronwen, and replaced about a.d. 550 by the building of Maelgwn Gwyned, prince of North Wales. In the early 10th century, Harlech castle was, apparently, repaired by Colwyn, lord of Arduw, founder of one of the fifteen North Wales tribes, and hence called Caer Colwyn. The present structure dates, like that at Conway, in the 13th century. Remains even from the plans of the architect of Carnarvon and Conway castles, but with the retention of old portions. It is thought to have been square, each side measuring some 210 ft., with towers and turrets. Glendower held it for four years. Here, in 1460, Margaret, wife of Henry VI., defeated at Northampton, took refuge. Dafydd ap Ieuan ap Einion held it for the Lancastrians, until famine, rather than Edward IV., made him surrender. From this time is said to date the air "March of the men of Harlech" (Rhyfelgerdd yw Harlech). The castle was alternately Roundhead and Cavalier in the civil war. Edward I. made Harlech a free borough, and it was formerly the county town. It is in the parish of Llandanwg (pop. in 1901, 931). Though interesting from an antiquarian point of view, the district around, especially Dyffryn Arudwy (the valley), is dreary and desolate,

vii. (with portrait). In memory of Professor Harkness his sister established two Harkness scholarships. One scholarship (of the value of about £35 a year) is awarded to a student of the intermediate course at Newham College, Cambridge, is awarded triennially to the best candidate in an examination in geology and palaeontology, provided that proficiency be shown; the other, for president Harkness early in the presidency of Cambridge, is awarded annually, any member of the university who has graduated as a B.A. "provided that not more than three years have elapsed since the thirteenth day of July in the year following his final examination for the degree of bachelor of arts."

HARLAN, JAMES (1820–1899), American politician, was born in Clark county, Illinois, on the 26th of August 1820. He graduated from Indiana Asbury (now De Pauw) University in 1843, was president (1846–1847) of the newly founded and short-lived Iowa City College, studied law, was first superintendent of public instruction in Iowa in 1847–1848, and was president of Iowa Wesleyan University in 1853–1855. He took a prominent part in organizing the Republican party in Iowa, and was a member of the United States Senate from 1855 to 1865, when he became secretary of the interior. He had been a delegate to the peace convention in 1861, and from 1861 to 1865 was chairman of the Senate committee on public lands. He disapproved of President Johnson's conservative reconstruction policy, retired from the cabinet in August 1866, and from 1866 to 1873 was again a member of the United States Senate. In 1866 he was a delegate to the loyalists' convention at Philadelphia. One of his principal speeches in the Senate was that which he made in March 1891 in reply to Sumner's and Schurz's attack on President Grant's Santo Domingo policy. He was presiding judge of the court of commissioners of Alabama claims (1882–1885). He died in Mount Pleasant, Iowa, on the 5th of October 1899.

HARLAN, JOHN MARSHALL (1833– ), American jurist, was born in Boyle county, Kentucky, on the 1st of June 1833. He graduated at Centre College, Danville, Ky., in 1850, and at the law department of Transylvania University, Lexington, in 1853. He was county judge of Franklin county in 1858–1859, was an unsuccessful candidate for the United States Congress on the Whig ticket in 1859, and was elected to the Constitutional Union ticket in 1860. On the outbreak of the Civil War he recruited and organized the Tenth Kentucky United States Volunteer Infantry, and in 1861–1863 served as colonel. Retiring from the army in 1863, he was elected by the Union party attorney-general of the state, and was re-elected in 1865, serving from 1863 to 1867, when he removed to Louisville to practise law. He was the Republican candidate for governor in 1871 and in 1873, and was a member of the commission which was appointed by President Grant to investigate the corruption in the building of the Harding of Louisiana (q.v.); and he was a member of the Bering Sea tribunal which met in Paris in 1893. On the 29th of November 1877 he became an associate justice of the United States Supreme Court. In this position he showed himself a liberal constructionist. In opinions on the Civil Rights cases and in the interpretation of the 13th, 14th and 15th Amendments to the Constitution, he dissented from the majority of the court and advocated increasing the power of the Federal government. He supported the constitutionality of the income tax clause in the Wilson Tariff Bill of 1894, and he drafted the decision of the court in the Northern Securities Company Case, which applied to railways the provisions of the Sherman Anti-Trust Law. In 1889 he became a professor in the Law School of the Columbian University (afterwards George Washington University) in Washington, D.C.

HARLAND, HENRY (1861–1905), American novelist, was born in St Petersburg, Russia, in March 1861, and was educated in New York and at Harvard. He went to Europe as a journalist, and after publishing several novels, mainly of American-Jewish life (under the name of Sidney Luska), first made his literary reputation in London as editor of the Yellow Book in 1894. His association with this clever publication, and his own contributions to it, brought his name into prominence, but it was not till he published The Cardinal's Snuff-box (1900), followed
HARLEQUIN—HARMONIC

ej. Drws (the door of) Arudwy, Rhinog fawr and Rhinog fach (cliffs); an exception is the verdant Cwm bychan (little combe or hollow). The Meini gwy Arudwy (stones of the men of Arudwy) possibly mark the site of a fight.

HARLEQUIN, in modern pantomime, the posturing and acrobatic character who gave his name to the "harlequinade," attired in mask and parti-coloured and spangled tights, and provided with a sword like a bat, by which, himself invisible, he works wonders. It has generally been assumed that Harlequin was transferred from France to the "Arlecchino" of Italian medieval and Renaissance popular comedy; but Dr Driesen in his *Ursprung des Harlekins* (Berlin, 1904) shows that this is incorrect. An old French "Harlekin" (Herlequin, Hellequin and other variants) is found in folk-literature as early as 1100; he had already become proverbial as a rasmagull of a demoniacal appearance and character; in 1626 a number of harlekins appear in a play by Adam de la Halle as the intermediaries of King Hellekin, prince of Fairyland, in courting Morgan le Fay; and it was not till much later that the French Harlequin was transformed into the Italian Arlechino.

In his typical French form down to the time of Gottsched, he was a spirit of the air, deriving thence his invisibility and his characteristic light and acry whirlings. Subsequently he returned from the Italian to the French stage, being imported by Marivaux into light comedy; and his various attributes gradually became amalgamated into the character of the modern Harlequin. He has already so far now appeared in Pepys' time, as he may be seen in Pepys' Diary (September 21, 1666), reading "to Harlequin's." Harlequin has also appeared in Pepys' time, as he may be seen in Pepys' Diary (September 21, 1666), reading "to Harlequin's."

HARLESS (originally HARLESS), GOTTLOB CHRISTOPH (1738-1815), German classical scholar and bibliographer, was born at Cumbach in Bavaria on the 21st of June 1738. He studied at Halle, Erlangen and Jena. In 1765 he was appointed professor of oriental languages and eloquence at the Gymnasium Casimirianum in Coburg, in 1770 professor of poetry and eloquence at Erlangen, and in 1776 librarian of the university. He held his professorship for forty-five years till his death on the 2nd of November 1815. Harless was an extremely prolific writer. His numerous editions of classical authors, of which he published anew and revised edition (12 vols., 1790-1809, not quite completed),--a task for which he was peculiarly qualified. He also wrote much on the history and bibliography of Greek and Latin literature.

His life was written by his son, Johann Christian Friedrich Harless (1848).

HARLINGEN, a seaport in the province of Friesland, Holland, on the Zuider Zee, and the terminus of the railway and canal from Leeuwarden (15½ m. E.). It is connected by steam tramway by way of Bolsward with Sneek. Pop. (1900) 10,448. Harlingen has become the most considerable seaport of Friesland since the construction of the large outer harbour in 1870-1877, and in addition to railway and steamship connexion with Bremen, Amsterdam, and the southern provinces there are regular sailings to the latter for London. Powerful sluices protect the inner harbour from the high tides. The only noteworthy buildings are the town hall (1730-1733), the West church, which consists of a part of the former castle of Harlingen, the Roman Catholic church, the Jewish synagogue and the schools of navigation and of design. The chief trade of Harlingen is the exportation of Frisian produce, namely, butter and cheese, cattle, sheep, fish, potatoes, flax, &c. There is also a considerable import trade in timber, coal, raw cotton, hemp and jute for the Twente factories. The local industries are unimportant, consisting of saw-mills, rope-yards, salt refiners, and sail-cloth and marine factories.

HARMATTAN, the name of a hot dry parching wind that blows during December, January and February on the coast of Upper Guinea, bringing a high dense haze of red dust which darkens the air. The natives smear their bodies with oil or fat while this parching wind is blowing.

HARMODIUS, a handsome Athenian youth, and the intimate friend of Aristogeiton. Hipparchus, the younger brother of the tyrant Hippias, endeavoured to supplant Aristogeiton in the good graces of Harmodius, but, failing in the attempt, revenged himself by putting a public affront on Harmodius's sister at a solemn festival. Thereupon the two friends conspired with a few others to murder both the tyrants during the armed procession at the Panathenaic festival (514 B.C.), when the people were allowed to carry arms (this licence is denied by Aristotle in *Ath. Pol*.). Seeing one of their accomplices speaking to Hippias, and imagining that they were being betrayed, they prematurely attacked and slew Hipparchus alone. Harmodius was cut down on the spot by the guards, and Aristogeiton was soon captured and tortured to death. When Hippias was expelled (510 B.C.), Harpocrates, an ally of Harmodius, continued to live in Athens. Hipparchus, an Athenian hero; his descendants were exempted from public burdens, and had the right of public entertainment in the Prytaneum, and their names were celebrated in popular songs and scolia (after-dinner songs) as the deliverers of Athens. One of these songs, attributed to a certain Callistatus, is preserved in Athenaeus (p. 605). Their statues by Antenor in the agora were carried off by Xerxes and replaced by new ones by Critius and Nestoës. Alexander the Great afterwards sent back the originals to Athens. It is not agreed which of these was the original. With it Polyneices bribed Eryphile to persuade his husband Amphairo to undertake the expedition against Thebes. It led to the death of Eryphile, of Alcmeon, of Phegeus and his sons. Even after it had been deposited in the temple of Athena Pronaia at Delphi, its baleful influence continued. Phylus, one of the Phocian leaders in the Sacred War (352 B.C.) carried it off and gave it to his mistress. After she had worn it for a time, her son was seized with madness and set fire to the house, and she perished in the flames. According to another account, Harmonia belonged to Samothrace and was the daughter of Zeus and Electra, her brother Jason being the founder of the mystic rites celebrated in the Phrygian festival, &c. v. *Mythol.*

Finally, Harmonia is rationalized as closely allied to Aphrodite Pandemos, the love that unites all people, the personification of order and civic unity, corresponding to the Roman Concordia.

Apollodorus iii. 4-7; Diod, Sic. iv. 65, 66; Parthenius, Erotica, 25; L. Preller, *Griech. Mythol.*; Crusius in Roscher's *Lexikon*.

HARMONIC. In acoustics, a harmonic is a secondary tone which accompanies the fundamental or primary tone of a vibrating string, reed, &c.; the more important are the 3rd, 5th, 7th, and octave (see *Sound, Harmonv*). A harmonic proportion in arithmetic and algebra is such that the ratio of the proportionals is in arithmetical proportion; thus, if a, b, c be in harmonic proportion then \( \frac{1}{a} = \frac{1}{b} + \frac{1}{c} \) are in arithmetical proportion; this leads to the relation \( b = ac/(a+c) \). A harmonic progression or series consists of terms whose reciprocals form an arithmetical progression; the simplest example is:
HARMONICA—HARMONIC ANALYSIS

1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots \text{(see ALGEBRA AND ARITHMETIC). The occurrence of a similar proportion between segments of lines is the foundation of such phrases as harmonic section, harmonic ratio, harmonic conjugates, &c. (see GEOMETRY: II. Practical). The connection between acoustical and mathematical harmonicals is probably to be found in the Pythagorean discovery that a vibrating string when stopped at \(\frac{1}{2}\) and \(\frac{1}{3}\) of its length yielded the octave and 5th of the original tone, the numbers, 1, 2, 3, being said to be, probably first by Archytas, in harmonic proportion. The mathematical investigation of the form of a vibrating string led to such phrases as harmonic curve, harmonic motion, harmonic function, harmonic analysis, &c. (see MECHANICS AND SPHERICAL HARMONICS).}

HARMONICA, a genre of term applied to musical instruments in which sound is produced by friction upon glass bells. The word is also used to designate instruments of percussion of the Glockenspiel type, made of steel and struck by hammers (Ger. Stahlharmonika).

The origin of the glass-harmonica tribe is to be found in the fashionable 18th century instrument known as musical glasses (Fr. verrillons), the principle of which was known already in the 17th century. The invention of musical glasses is generally ascribed to an Irishman, Richard Pockrich, who first played the instrument in public in Dublin in 1734, and the year after in London, but Elisel described the verrillon and gave an illustration of it in 1738. The verrillon or Glassspiel consisted of 18 beer glasses arranged on a board covered with cloth, water being poured in when necessary to alter the pitch. The glasses were struck on both sides gently with two long wooden sticks in the shape of a spoon, the bowl being covered with silk or cloth. Elisel states that the instrument was used for church and other solemn music. Gluck gave a concert at the little theatre in the Haymarket (London) in April 1746, at which he performed on musical glasses a concerto of his composition with full orchestral accompaniment. E. H. Delavall is also credited with the invention. When Benjamin Franklin visited London in 1757, he was so much struck by the beauty of tone elicited by Delavall and Pockrich, and with the possibilities of the glasses as musical instruments, that he set to work on a mechanical application of the principle involved, the eminently successful result being the glass harmonica finished in 1762. In this the glass bowls were mounted on a rotating spindle, the largest to the left, and their under-edges passed during each revolution through a water-trough. By applying the fingers to the under-edges, sound was produced varying in intensity with the pressure, so that a certain amount of expression was at the command of a good player. It is said that the timbre was extremely enervating, and, together with the vibration caused by the friction on the finger-tips, exercised a highly deleterious effect on the nervous system. The instrument was for many years in great vogue, not only in England but on the Continent of Europe, and more especially in Saxony, where it was accorded a place in the court orchestra. Mozart, Beethoven, Naumann and Hase composed music for it. Marianne Davier and Mariana Kirchgesner were celebrated virtuosi on it. The curious vogue of the instrument, as sudden as it was ephemeral, produced emulation in a generation unsurpassed for zeal in the invention of musical instruments. The most notable of its offspring were Carl Leopold Röllig’s improved harmonica with a keyboard in 1786, Cladini’s euphon in 1791 and clavicylinder in 1790, Ruffelsen’s melodion in 1800 and 1803; Franz Leppich’s pann-melodion 1810, Buschmann’s uranion in the same year, &c. Of most of these nothing now remains but the name and a description in the (see Altgedeine musikalische Zeitschrifte). But there are numerous specimens of the Franklin type in the museums for musical instruments of Europe. One specimen by Emanuel Pohl, a Bohemian maker, is preserved in the Victoria and Albert Museum, London.

For the steel harmonica see GLOCKENSPIEL.

HARMONIC ANALYSIS, in mathematics, the name given by Sir William Thomson (Lord Kelvin) and P. G. Tait in their treatise on Natural Philosophy to a general method of investigating the nature of waves, and used by them to express views which had to be suggested by the study of the vibrations of strings and the analysis of these vibrations into their fundamental tone and its harmonics or overtones.

The motion of a uniform stretched string fixed at both ends is a periodic motion; that is to say, after a certain interval of time, called the fundamental period of the motion, the form of the string and the velocity of every part of it are the same as before, provided that the energy of the motion has not been sensibly dissipated during the period.

Two different methods of investigating the motion of a uniform stretched string. One of these may be called the wave method, and the other the harmonic method. The wave method is founded on the theorem that in a stretched string of infinite length a wave of any form may be propagated in either direction, with a certain velocity, \(v\), which we may define as the velocity of propagation. If a wave of any form travelling in the positive direction meets another travelling in the opposite direction, the form of which is such that the lines joining corresponding points of the two waves are all bisected in a fixed point in the line of the string, then the point of the string corresponding to this point will remain stationary, while the mass of string between these two bisected points continues to travel at a velocity equal to the sum of the velocities of the two waves. If we now suppose that the form of the waves travelling in the positive direction is periodic, that is to say, that after the wave has travelled forward a distance \(l\), the position of every particle of the string is the same as before, it will be proved that the time of travelling a wave-length is called the periodic time, which we shall denote by \(T\), so that \(l = VT\).

If we now suppose the waves similar to these, but reversed in position, to be travelling in the opposite direction, there will be a series of points, distant \(\frac{l}{2}\) from each other, at which there will be no motion of the string; it will therefore make no difference to the total effect to consider the string as if we suppose the string fastened to fixed supports at any two of these points, and we may then suppose the parts of the string beyond these points to be removed, as it cannot affect the motion of the part which is between them. We will thus have arrived at the conclusion that two fixed supports, and we conclude that the motion of the string may be completely represented as the resultant of two sets of periodic waves, travelling in opposite directions, their wave-lengths being either twice the distance between the fixed points or a submultiple of this wave-length, and the form of these waves, subject to this condition, being perfectly arbitrary.

To make the problem a definite one, we may suppose the initial displacement and velocity of every particle of the string given in terms of its distance from one end of the string, and from these data it is easy to calculate the form which is common to all the travelling waves, and to determine the wave lengths, velocities of propagation, and positions of the fixed supports which would be determined by calculating the positions of the two sets of waves at that time, and compounding their displacements.

If the wave-length of the string is considered as the resultant of two wave motions, neither of which is of itself, and without the other, consistent with the condition that the ends of the string are fixed. Each of the wave motions is periodic, the wave-lengths not necessarily the same, the distances of the fixed points, and the one set of waves is the reverse of the other in respect of displacement and velocity and direction of propagation; but, subject to these conditions, the form of the waves is perfectly arbitrary. The motion of a particle of the string, being determined by the two waves which pass over it in opposite directions, is of an equally arbitrary type.

In the harmonic method, on the other hand, the motion of the string is regarded as compounded of a series of vibratory motions (normal modes of vibration), which may be infinite in number, but each of which is perfectly definite in type, and of which the terms are as distinct as the problem of string with its ends fixed.

A simple harmonic motion is thus defined by Thomson and Tait (§53).—When a point \(O\) moves uniformly in a circle, the perpendicular OP, drawn from its position at any time, to the tangent AA of the circle, intercepts the diameter in a point \(P\) whose position changes by a simple harmonic motion.

The amplitude of a simple harmonic motion is the range on one side of the central point of the circle.

The period of a simple harmonic motion is the time which elapses from any instant until the moving-point again moves in the same direction through the central point.

The phase of a simple harmonic motion at any instant is the fraction of the whole period which has elapsed since the moving-point last passed through its middle position in the positive direction.

In this method the vibrating string is considered to be a simple harmonic motion. In these particular cases the form of the string at any instant is that of a curve of sines having the line joining the fixed
points for its axis, and passing through these two points, and therefore having for its wave-length either twice the length of the string or some submultiple of this wave-length. The amplitude of the curve of sines is a simple harmonic function of the time, the period being either the half or the whole of the period of the fundamental. Every one of these modes of vibration is dynamically possible by itself, and any number of them may coexist independently of each other. The interference of the initial amplitude and phase of each of these modes of vibration, so that their resultant shall represent the initial state of the string, we obtain a new representation of the whole motion of the string, in which it is seen to be the resultant of a series of simple harmonic vibrations whose periods are the fundamental period and its submultiples. The determination of the amplitudes and phases of the several simple harmonic vibrations so as to satisfy the initial conditions is an example of harmonic analysis.

We have thus two methods of solving the partial differential equation of the wave, and in each of them the wave is treated as a sum of simple harmonic vibrations. The first method, which Thomson, in his paper on the vibrations of a string, has treated, is to consider the wave as a sum of simple harmonic vibrations, and to determine the amplitudes of the simple harmonic vibrations, and the phases of these vibrations as functions of the position and time. The second method consists in determining the amplitudes and phases of the simple harmonic vibrations separate for each value of the position of the string, and then combining these vibrations to represent the whole motion of the string. In terms of the theory of mechanical vibrations, the first method is called the method of the synthesis of the vibrations of the string, and the second is called the method of the analysis of the vibrations of the string.

HARMONIC ANALYSIS

\[
\Phi(t) = \sum_{n=1}^{\infty} \left( A_n \cos \frac{2\pi n t}{L} + B_n \sin \frac{2\pi n t}{L} \right)
\]

where the periods \(2\pi n/L, 2\pi n/L, \ldots \) of the various simple-harmonic constituents are already known with sufficient accuracy, although they may have no very simple relations to one another. The problem of determining the most probable values of the constants \(A_n, B_n, A_0, B_0, \ldots \) by the least squares method of a series of recorded values of the function \(f(t)\) is then in principle a fairly simple one, although the actual numerical work may be laborious (see Tidels). A much more difficult and delicate question arises when, as in various cases of meteorological, terrestrial magnetism, the periods \(2\pi n/m, 2\pi n/m, \ldots \) are themselves unknown to begin with, or are at most conjectural. Thus, it may be desirable to ascertain whether the magnetic declination contains a periodic element synchronous with the sun's rotation on its axis, whether any periodicities can be detected in the records of the prevalence of sun-spots, and so on.

From a strictly mathematical standpoint the problem is, indeed, a very difficult one, for which Thomson, in his paper on the vibrations of a string, has treated, is to consider the wave as a sum of simple harmonic vibrations, and to determine the amplitudes of the simple harmonic vibrations, and the phases of these vibrations as functions of the position and time. In terms of the theory of mechanical vibrations, the first method is called the method of the synthesis of the vibrations of the string, and the second is called the method of the analysis of the vibrations of the string.

So far as Fourier's theorem asserts that any periodic function of a single variable periodical expression of the form

\[
\phi(t) = \sum_{n=1}^{\infty} \left( A_n \cos \frac{2\pi n t}{L} + B_n \sin \frac{2\pi n t}{L} \right)
\]

The part of the theorem which is most frequently used, and which also is the easiest to investigate, is the determination of the values of the coefficients \(A_n, B_n, \ldots \) are

\[
A_n = \int_0^L \phi(t) \cos \frac{2\pi n t}{L} dt, \quad B_n = \int_0^L \phi(t) \sin \frac{2\pi n t}{L} dt.
\]

The series is evidently single-valued for any given value of \(\xi\). It cannot therefore represent a function of \(\xi\) which has more than one value, or which becomes imaginary for any value of \(\xi\). It is convergent, approaching to the true value of \(\phi(\xi)\) for all values of \(\xi\) such that if \(\xi\) varies infinitesimally the function also varies infinitesimally.

Lord Kelvin, availing himself of the disk, globe and cylinder integrating mechanism invented by his brother, Professor James Thomson, constructed a machine by which eight of the integrals could be obtained, and which it was possible to obtain the complete table of the integral functions of the time. Thomson's machine could not be driven by a rack, and the tide itself might work the second variable of the machine, but this would involve the constant presence of an expensive mechanism at every tidal station.

For a discussion of the restrictions under which the expansion of a periodic function of \(\xi\) in the form (1) is valid, see FOURIER'S Series. An account of the contrivances for mechanical calculation of the coefficients \(A_n, B_n, \ldots\) is given under Calculating Machines.

A more general form of the problem of harmonic analysis presents itself in astronomy, in the theory of the tides, and in various magnetic and other problems of geophysical interest; for instance, that a variable quantity \(f(t)\) is known theoretically to be of the form

\[
f(t) = A_0 + A_1 \cos \frac{2\pi n t}{L} + B_1 \sin \frac{2\pi n t}{L} + \ldots
\]

where \(f(t)\) is a function of time, and the coefficients \(A_0, A_1, B_1, \ldots\) are given. If the function \(f(t)\) is to be represented by a series of simple harmonic functions, then the problem is to determine the coefficients \(A_n, B_n, \ldots\) so that the series is a good approximation to \(f(t)\). This problem is known as the problem of the determination of the harmonics of a given function, and it is a problem of great importance in many branches of science, particularly in the theory of the tides and in the theory of the motion of the earth.

The condition that \(f(x)\) is to vanish for \(x = a\) and \(x = \ell\) leads to a transcendental equation in \(A_1, B_1, \ldots\), which cannot be solved exactly in general. However, if the function \(f(x)\) is of the form

\[
f(x) = C \sin \frac{2\pi x}{L} + D \cos \frac{2\pi x}{L} + E \sin \frac{4\pi x}{L} + \ldots
\]

It may be shown further that if \(v\) and \(s\) are different we have the conjugate or orthogonal relation

\[
\int_a^\ell \left( A_n \cos \frac{2\pi n x}{L} + B_n \sin \frac{2\pi n x}{L} \right) dx = 0.
\]
HARMONIC CHORD—HARMONION

This enables us to determine the coefficients, thus

\[ C_r = \int_0^1 \rho(x) u(x) \, dx = \int_0^1 \rho'(x) \, dx. \]  

(13)

The extension to spaces of two or three dimensions, or to cases where there is more than one dependent variable, must be passed over. The mathematical theories of acoustics, heat-conduction, elasticity, induction of electric currents, and so on, furnish an indefinite supply of examples, and have suggested in some cases methods which have a very wide application. Thus the transverse vibrations of a circular membrane lead to the theory of Bessel’s Functions; the oscillations of a spherical sheet of air suggest the theory of expansions in spherical harmonics and so forth. The physical, or intuitive, theory of such methods has naturally always been in advance of the mathematical. From the latter point of view, in a few instances the Hertzian wave-motion of the Hertzian kind of wave-motion, recently, has been treated in a rigorous and satisfactory manner. A more general and comprehensive method, which seems to derive some of its inspiration from physical considerations, has, however, at length been inaugurated, and has been vigorously cultivated in recent years by D. Hilbert, H. Poincaré, I. Fredholm, E. Picard and others.

HARMONIC CHORD, an ingenious kind of upright piano, in which the strings were set in vibration not by the blow of the hammer but by indirectly transmitted vibration. The harmonichord, one of the many attempts to fuse piano and violin, was invented by Johann Gottfried and Johann Friedrich Kaufmann (father and son) in Saxony at the beginning of the 19th century, when the craze for new and ingenious musical instruments was at its height. The case was of the variety known as *giraffe*. The space under the keyboard was enclosed, a knee-hold being left in which were two pedals used to set in rotation a large wooden cylinder fixed just behind the keyboard over the levers, and covered with a roll-top similar to those of modern office desks. The cylinder (in some specimens covered with chamois leather) tapered off at the bottom. When a key was depressed, a little tongue of wood, one end of which stopped the string, was pressed against the revolving cylinder, and the vibrations produced by friction were transmitted to the string and reinforced as in piano and violin by the soundboard. The adjustment of the parts and the velocity of the cylinder required delicacy and great nicety, for if the little wooden tongues rested too lightly upon the cylinder or the strings, harmonics were produced, and the note jumped to the octave or twelfth. Sometimes when chords were played the touch became so heavy that two performers were required, as in the early medieval organist, the prototype of the harmonichord. Carl Maria von Weber must have had some opinion of the possibilities of the harmonichord, in which tone resembled the glass harmonica, since he composed for it a concerto with orchestral accompaniment. (K. S.)

HARMONION (Fr. harmonion, orgue expressif; Ger. Phys-harmonika, Harmonion), a wind keyboard instrument, a small organ without pipes, furnished with free reeds. Both the harmonion and its later development, the American organ, are known as free-reed instruments, the musical tones being produced by tongues of brass, technically termed "vibrators" (*Fr. anche libre; Ger. durchschlagende Zunge; Ital. ancora o lingua libera*). The vibrator is fixed over an oblong, rectangular frame, through which it swings freely backwards and forwards like a pendulum while vibrating, whereas the beating reeds (similar to those of the clarinet family), used in church organs, cover the entire orifice, beating against the sides at each vibration. A reed or vibrator, set in periodic motion by impact of a current of air, produces a corresponding succession of air pulses, the rapidity of which determines the pitch of the musical note.

There is an essential difference between the harmonion and the American organ in the direction of this current; in the former the wind apparatus forces the current upwards, and in the latter sucks it downwards, whence it becomes desirable to separate in description these varieties of free-reed instruments.

The harmonion has a keyboard of five octaves compass when complete, and a simple action controlling the valves, &c. The necessary pressure of wind is generated by bellows worked by the feet of the performer upon foot-boards or treadles. The air is thus forced up the wind-trunks into an air-chamber, the air-chamber being a wind-chest, or, as it is termed in Germany, a reservoir, which receives the excess of wind through an aperture, and permits escape, when above a certain pressure, by a discharge valve or pallet. The aperture admitting air to the reservoir may be closed by a drawstop named "expression." The air being thus cut off, the performer depends for his supply entirely upon the management of the bellows worked by the treadles, whereby he regulates the compression of the wind. The character of the instrument is then entirely changed from a mechanical response to the player’s touch to an expressive one, rendering what emotion may be communicated from the player by increase or diminution of pressure transmitted through the air-chamber. These free-reed reeds may be admitted or excluded from the wind-chest by drawstops bearing the names of the different registers in imitation of the organ, admit, when drawn, the wind from the wind-chest to the corresponding reed compartments, releasing them, shutting them off. The reed compartments are of about two octaves and a half each, there being a division in the middle of the keyboard scale dividing the stops in bass and treble. A stop being wind and small pianissimo, the key pressed down, wind is admitted by a corresponding valve to a reed or vibrator (fig. 1). Above each reed in the so-called "double," a wind-board or pan is a channel, a small air-chamber or cavity, the shape and capacity of which have greatly to do with the colour of the note in the harmonion. The second of the von der Leyen theory is highly compressed at an even or a varying pressure as the expression-stop may not be or may be more than a double pressure of wind. The wind is allowed to escape by knee pellots (fig. 1.—Free Reed) or pellots by pressing down the corresponding key. In Muset or other good harmonions, the reed compartments that form the scheme of the instrument are eight in number, four bass and four treble, of three different pitches of *bourdon* and double bourdon (double diapason), the three bass and treble rows are the "diapason" of the pitch known as 8 ft., and the bourdon (double diapason), 16 ft. These may be & Co, & by means of the following:—(1.)—Free Reed technically the front organ. The back organ has Vibrator, Alexandre solo and combination stops, the principal of 4 Harmonium. ft. (octave higher than diapason), and bassoon. (2.)—Free Reed and free blocks (the latter generally mechanically combined by a stop called full organ. The French maker, Muset, added other registers for much-admired effects of tone, viz. "harpe éolienne," two bass rows of 2 ft. pitch, the one tuned a beat too flat, to produce a waving tremulous tone that has a certain charm; "musette" and "voix celeste," 16 ft.; and "baryton," a treble stop, 32 ft., or two octaves lower than the natural note of the key. The "back organ" is usually covered by a swell box, containing louvres or shutters similar to a Venetian blind, and divided into foures corresponding with the bass and treble registers of the free organ, the notes of each row being governed by knee pellots which act by pneumatic pressure. Turning the reeds is effected by scraping them at the point to sharpen them, or near the shoulder or heel to flatten them in pitch. Air pressure affects the pitch slightly, being noticeable only in the larger reeds, and harmonions long retain their tuning, a decided advantage over the organ and the pianoforte. Mechanical contrivances in the harmonion, of frequent or occasional employment, besides those already described, are the "double," a pneumatic机关 of hammer and escapement which, acting upon the reeds of the diapason rows at the moment air is admitted to them, gives prompt response, the expression of the key, or quicker speed of the "double expression," a pneumatic balance of great delicacy in the wind reservoir, exactly maintaining by gradation equal pressure of the wind; and the "double touch," by which the back organ registers a slow series of notes that are called upon by deeper pressure of the key, thus allowing prominence or accentuation of certain parts by an expert performer. "Prolongement," permits selected notes to be sustained after the fingers have quitted.
their keys. Davew's "melody attachment" is to give prominence to an air or treble part by shutting off in certain registers all notes below it. This notion has been adapted by inversion to a "substitute" to strengthen or weaken the free air, and effects the wind in the vicinity of the reeds by means of small bellows which increase the velocity of the pulsation according to pressure; and the "sounding" diminishes the supply of wind by controlling its admission to the reeds through various reeds that are left open, setting them in vibration.

The American Organ acts by vacuum. A exhaustion is practically created in the air-chamber by the exhausting power of the footboards, and the pressure of air, which is forced through any reeds that are left open, setting them in vibration. This instrument has therefore exhaust instead of force bellows. Valves in the board above the air-chamber give communication to reeds (fig. 2) made more or less forced. The American organ has a softer tone than the harmonium; this is sometimes aided by the use of extra resonators, as, for instance, in Clough & Warren's (of Detroit, Michigan, U.S.). The blowing being also easier, ladies find it much less fatiguing. The pressure of air on the bellows of the American organ, and is generally absent; the automatic swell in the instruments of Mason & Hamlin (of Boston, U.S.) is a convenience that compromises the nearest possible air, though far inferior. By it a swell shutter or rail is kept in constant movement, proportioned to the force of the current. The blowers are always used with one register of free reeds--the sub-bass," a smaller rail, in the instruments. Another very valuable effect on wind pressure; its rotation, disturbing the air near the reeds, causes interferences of vibration that produce a tremulous effect, not unlike the beatings heard from combined voices, whence the name. The arrangement of reed chambers in American organs does not essentially differ from that of harmoniums; but there are often two keyboards, and then the solo and combination stops are found on the upper manual. The diapason treble register is known as "melodia"; different makers occasionally use the vary of fancy names for other stops. The sub-bass, however, an octave of 16 ft. pitch and always apart from the other reeds, is found for the bass registration on the manual, the compass of American organs being usually down to F (FF, 5 octaves). In large instruments there are sometimes foot pedals as in an organ; the two systems of 8 ft., 4 ft., lowest note being on top, then CC. Blowing for pedal instruments has to be done by hand, a lever being attached for that purpose. The celeste stop is managed as in the harmonium, by rows of reeds tuned not quite in unison, or by a shade valve that alters the air-current and flattens one row of reeds thereby.

Harmoniums and American organs are the result of many experiments in the application of free reeds to keyboard instruments. The principle of the free reed became widely known in Europe through the introduction of the Chinese ch'eng during the second half of the 18th century, and culminated in the invention of the harmonium and organ-grinder instruments. The first step in the invention of the harmonium is due to Professor Christian Gottlieb Kratzenstein of Copenhagen, who had the opportunity of examining a cheng sent to his native city and of testing its merits. In 1779 the Academy of Sciences of St Petersburg had offered a prize for an essay on the formation of the vowel sounds on an instrument similar to the "vox humana" in the organ, which should be capable of reproducing these sounds faithfully. Kratzenstein made a description of the instrument on an ordinary pipe organ with free reeds, and presented it to the Academy of St Petersburg. His essay was crowned and was republished with diagrams in Paris in 1782.

Meanwhile, in 1780, a countryman of Kratzenstein's, an organ-builder named Kirsnick, established in St Petersburg, adapted these reed pipes to some of his organs, and to an instrument of his own invention, an organ-grinder instrument. When Abt Vogler visited St Petersburg in 1788, he was so delighted with these reeds that in 1790 he induced Rackwitz, an assistant of Kratzenstein's, to come to him and adapt some to an organ he was building. Three reeds were used to support an orchestration, a chamber organ containing some 900 pipes, was completed, and, according to Rackwitz, was fitted with free-reed pipers. Vogler stated that, however, the free air of the instrument was of no use.

The introduction of free-reed stops into the organ, however, took a secondary place in his scheme for reform. Friedrich Kaufmann of Dresden states that Vogler told him he had imparted to J. N. Mäzel of Vienna particulars as to the construction of free-reed pipes, and that the latter used them in his panharmonicon, which he exhibited during his stay in Paris from 1805 to 1807. Kaufmann suggests that it was through him that G. J. Gritten obtained the knowledge which led to his experiments with free reeds in organs. It is more likely that they were independently invented with free reeds. In 1812 his first organ expressif was finished. It was a small organ with one register of free-reeds—the expressive stop, used for the higher parts of the scale, and to produce the swell in the wind-chest and bellows. It would seem from his description of the orchestra in Data zur Akustik that Vogler knew of no such device. He used the swell shutter borrowed from England and a swivel stop, both having the same effect as the swell in the instrument, neither of which is capable of increasing the volume of sound from the organ, or at least only after having first damped the sound to a pianissimo. Vogler explains minutely the apparatus used for the free air, and the free reeds are described with reference to the natural public.

The credit of discovering in the free reed the capability of dynamic expression was undoubtedly due to Gritten, although Abt Vogler claims to have used compression in 1769, and Kaufmann in his choralion in 1816. A larger organ expressif was begun by Gritten for the Conservatoire of Paris in 1812, the construction of which was interrupted and then continued in 1816. Descriptions of this instrument were published in France and Germany.

The organ of the Conservatoire had a pedal free-reed stop of 16 ft. with vibrators 0.240 m. long, 0.035 m. wide, and 0.003 m. thick. Two compressors, one for the treble and the other for the bass, worked by bellows, enabled the performer to regulate the pressure of wind on the reeds and therefore to obtain the gradations of forte and piano which gained for his instrument the name of organ expressif. Gritten's instrument was a pipe organ, the pipes terminating in a cone with a hemispherical cap in the top of which was a small hole. There were eight registers including the pedal, and the positive on the first keyboard had reed stops furnished with...
HARMONIUM

besting reeds. Biot insists on the importance of the regulating wires (Fr. rasettes; Ger. Krücker) for determining the vibrating length of the reed tongue and maintaining it invariable. These are clearly shown in his diagram (see article FREE REED VIBRATOR, fig. 1); they do not essentially differ from those used with the beating-reed stops in his organ (fig. 76, pl. I.), or indeed from those figured by Praetorius.

Isolated specimens of the cheng must have found their way to Europe during the 15th and 16th centuries, for Mersenne! depicts part of one showing the free reed. It would seem that still earlier in the 17th century there was an organ in a monastery in Hesse with free reeds for the Posaune stop, for Praetorius gives a description of the "extraordinary" reed (p. 169); there is no record of the instrument in this case.

During the first half of the 19th century various tentative efforts in France and Germany, and subsequently in England, were made to produce new keyboard instruments with free reeds, the most notable of these being the phystarmonica 2 of Anton Rückel, invented in Vienna in 1818, which, improved and enlarged, has retained its hold on the German people. The modern phystarmonica is a harmonium without stops or percussion action; it does not therefore speak readily or clearly. It has a range of five to six octaves. Other instruments of similar type are the French melophone and the English seraphine, a keyboard harmonica with bellows but no channels for the tongues, for which a patent was granted to Myers and Storer in 1839; the aeolion or aeolicon 3 of Eschenbach; the melodion 4 of Dietz; the melodica 5 of Rieffelson; the apollionicon; 6 the new cheng 7 of Reichstein; the terpodion 8 of Buschmann, &c. None of these has survived to the present day.

The inventor of the harmonium was indubitably Alexandre Debain, who took out a patent for it in Paris in 1849. He produced varied timbre registers by modifying reed channels, and brought these registers on to one keyboard. Unfortunately he patented too much, for he secured even the name harmonium, obliging contemporary and future experimenters to shelter their improvements under other names, and the venerable name of organ becoming impressed into connexion with an inferior instrument, we have now to distinguish between reed and pipe organs. The compromise of reed organ for the harmonium class of instruments must therefore be accepted. Debain's harmonium was at first quite mechanical; it gained expression by the expression-stop already described. The Alexanders, well-known French makers, by the ingenuity of one of their workmen, P. A. Martin, added the percussion and the prolongement. The melody attachment was the invention of an English engineer: the introduction of the double touch, now used in the harmoniums of Mustel, Bauer and others—also in American organs—was due to Tamplin, an English professor.

The principle of the American organ originated with the Alexanders, whose earliest experiments are said to have been made with the view of constructing an instrument to exhaust air. The realization of the idea proving to be more in consonance with the genius of the American people, to whom what we may call the devotional tone of the instrument appealed, the introduction of it by Messrs Mason and Hamlin in 1861 was followed by remarkable success. They made it generally known in Europe by exhibiting it at Paris in 1867, and from that time instruments have been exported in large numbers by different makers. (A. J. H.; K. S.)
